Bird site use:

☑ **Nesting** ☐ **Rookery** ☐ **Nesting colony** ☐ **Burrow site** ☐ **Lek**

☐ **Non-breeding (over-wintering)** ☐ **Communal roost** ☐ **Other**

Site use description:

What was the observed behavior? Pairs were observed foraging, nest building, incubating nest, feeding nestlings, and feeding juveniles. Individual male was observed foraging.

Describe any evidence of reproduction: Twenty-five pairs were observed to have successfully nested; a total of thirty-eight juveniles were observed during focused survey.

SITE INFORMATION

Habitat description: Riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, and southern black willow forest/riparian herb occur upstream of the Dam on the project site.

Slope:

Land owner/manager: Private - Irvine Ranch

Aspect:

Site condition + population viability: Excellent

Immediate & surrounding land use: Undeveloped open space, Santiago Dam, and Irvine Regional Park.

Visible disturbances: Noise/human activity associated with shoreline fishing. Noise/wind disturbance associated with helicopter training exercises by Orange County Sheriff Department and Orange County Fire Authority.

Threats:

General comments:

LEAST BELL'S VIREO SURVEY DATA SUMMARY FORM

LEAST BELL'S VIREO SURVEY DATA SUMMARY

Site Information

Project Title:	Santiago Creek Dam Outlet Tower and Spillway Improvement Project
Landowner:	County of Orange

Survey Information

Surveyors:	Jonathan Aguayo	Year:	2022

Survey Begin Coordinates		Survey End Coordinates		Datum
Northing:	3736684	Northing:	3737277	NAD83
Easting:	**432888**	Easting:	436296	NAD83

Survey Length (Km)	Total Number of Surveys	Total Number of Survey Hours
7.6	8	54.18

Least Bell's Vireo Detection Information

Number of males that were:

Paired:	27	Based on observation of female, nest, young, or nesting behavior (nest-building, food carrying).
Undetermined Status:	1	The total number of resident males not confirmed as paired.
Transient:	1	Only detected once despite repeated surveys, or were not detected at the same location for more than 2 weeks.
Total number of males:	29	The sum of the three categories above.

Coordinates for LBVI Territories (continue on second sheet if necessary)

Territory ID	Northing	Easting	Status/Comments (e.g. paired)
1	3736302	434224	paired, fledged two juveniles

APPENDIX L

WESTERN YELLOW-BILLED CUCKOO SURVEY

September 30, 2022

Ms. Stacey Love
U.S. Fish and Wildlife Service
2177 Salk Avenue, Suite 250
Carlsbad, California 92008

VIA EMAIL
Stacey_Love@fws.gov

Subject: Results of the 2022 Western Yellow-Billed Cuckoo Surveys for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love:

This Letter Report presents the results of focused surveys to determine the presence or absence of the western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, (hereinafter referred to as the "proposed project") located in Orange County, California (Exhibit 1). The purpose of the surveys was to determine the presence or absence of the western yellow-billed cuckoo upstream of Santiago Dam. A Biologist with the necessary experience and the Federal Endangered Species Act 10(a) survey permit conducted the surveys according to U.S. Fish and Wildlife Service (USFWS) protocol for this species. Notification of the intent to conduct protocol-level surveys was submitted to the USFWS on May 26, 2022.

PROJECT DESCRIPTION AND LOCATION

The project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). The Biological Study Area includes Santiago Creek Dam, downstream areas along Santiago Creek, areas around Irvine Lake, and upstream areas along Santiago Creek. The Biological Study Area is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

The Biological Study Area is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the Biological Study Area in the northwest, downstream of the Dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the Biological Study Area. Elevations in the Biological Study Area range from approximately 657 to 996 feet above mean sea level.

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Tel 714.751.7373
Fax 714.545.8883
www.Psomas.com

The Biological Study Area is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Creek Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD)[1] is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The IRWD and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Division of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the design phase. Staging areas are currently planned to be placed in disturbed areas on the east side of Irvine Lake, adjacent to where Santiago Creek flows into the lake. Focused surveys were conducted along Santiago Creek upstream of the lake to determine whether western yellow-billed cuckoo is present or absent adjacent to the proposed staging areas on the east side of the lake.

SURVEY AREA

A variety of vegetation types occur in the Biological Study Area, including sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, western sycamore, and vegetated fluctuating shoreline. Other landcover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

The survey area for the western yellow-billed cuckoo includes all suitable riparian habitats (i.e., southern sycamore riparian woodland, southern black willow forest, disturbed southern black willow forest, and southern black willow forest/riparian herb) upstream of the dam (Exhibit 3). The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (i.e., Irvine Lake) (Exhibit 4).

Specifically, western yellow-billed cuckoo surveys were conducted in portions of the survey area that contained suitable riparian habitat of appropriate size and stature. Riparian habitats were distributed throughout the survey area. These habitat types were generally dominated by Goodding's black willow (*Salix gooddingii*), red willow (*Salix laevigata*), arroyo willow (*Salix laseolepis*), Fremont cottonwood (*Populus fremontii* ssp. *fremontii)*, western sycamore (*Platanus racemosa*), and white alder (*Alnus rhombifolia*). The understory and edges of these areas contained scattered mule fat (*Baccharis salicifolia* ssp. *salicifolia*), flatsedge (*Cyperus* sp.), broad-leaved cattail (*Typha latifolia*), saltcedar (*Tamarix ramosissima*), giant reed (*Arundo donax*), gum trees (*Eucalyptus* spp.), tree tobacco (*Nicotiana glauca*), and non-native grasses. Site photographs of representative habitat in the survey area are provided in Attachment A.

[1] The Santiago County Water District (SCWD) was also a participating jurisdiction in the NCCP/HCP. The SCWD consolidated with IRWD in 2006.

SPECIES BACKGROUND

Western yellow-billed cuckoo (Distinct Population Segment [DPS]) is a federally and State listed Endangered species. The USFWS concluded that the western population was discrete from the eastern population based on geographic separation during the breeding season, morphological differences, and behavioral differences (USFWS 2014a). The western yellow-billed cuckoo generally occurs west of the crest of the Rocky Mountains, specifically in southwest British Columbia in Canada; Washington, Idaho, western Montana, Oregon, California, Nevada, southwestern Wyoming, Utah, western Colorado, Arizona, western New Mexico, and Texas in the United States; and Baja California Sur, Sonora, Sinaloa, western Chihuahua, and northwestern Durango in Mexico (USFWS 2014a). It winters in South America east of the Andes, primarily south of the Amazon Basin in southern Brazil, Paraguay, Uruguay, eastern Bolivia, and northern Argentina (Ehrlich et al. 1992; American Ornithologists' Union 1998; Johnson et al. 2008). The western yellow-billed cuckoo arrives in southern California between late May and early July, with most arriving in mid-June; it departs for its wintering grounds from mid-September to mid-October (Halterman et al. 2015). The peak of breeding activity lasts about one month and is typically in July; but in some years it can begin as early as May and can end as late as September (Laymon et al. 1997; Halterman 1991, 2009; McNeil et al. 2013; Halterman et al. 2015).

The western yellow-billed cuckoo requires large tracts of riparian forest or woodland habitat along low-gradient rivers and streams in open riverine valleys that provide wide floodplain conditions (USFWS 2014b). The optimal size of habitat patches for the species is generally greater than 200 acres in extent and has dense canopy closure and high foliage volume of willows and cottonwoods (Laymon and Halterman 1989). Habitat between 100 acres and 200 acres, although considered suitable, are not consistently used by the species (Laymon and Halterman 1989). Habitat patches from 50 to 100 acres in size are considered marginal habitat; sites less than 37 acres are considered unsuitable habitat (Laymon and Halterman 1989). The species does not use narrow, steep-walled canyons (USFWS 2014b). Sites with strips of habitat less than 325 feet in width are rarely occupied for nesting (USFWS 2014b). Stopover and foraging sites can be similar to breeding sites but can be smaller in size (sometimes less than 10 acres in extent), narrower in width, and lack understory vegetation when compared to nesting sites (Laymon and Halterman 1989; USFWS 2014b). Minimum patch size for cuckoo occupancy is 12.4 acres; no cuckoos have been detected attempting to nest in patches this size or smaller in California or Arizona (Halterman et al. 2001; Johnson et al. 2010). They have also not been found nesting in narrow, linear habitat that is less than 33 to 66 feet wide (Halterman et al. 2015).

Optimal breeding habitat contains willow-dominated groves with dense canopy closure and well-foliaged branches for nest building with nearby foraging areas consisting of a mixture of cottonwoods and willows with a high volume of healthy foliage (USFWS 2014b). Sites can be relatively dense, contiguous stands or irregularly shaped mosaics of dense vegetation with open areas (USFWS 2014b). In California, habitat often consists of willows mixed with Fremont cottonwood (Halterman et al. 2015). Nest trees range from 10 feet to 98 feet in height and are an average of 35 feet in height. Nests are typically well-concealed in dense vegetation (Halterman 2002; Laymon et al. 1997; McNeil et al. 2013). Hydrologic conditions can vary from dry in some years to inundated in others (USFWS 2014b). Humid conditions created by surface and subsurface moisture appear to be important habitat parameters for selection of nest sites (USFWS 2014b). Multiple studies have found that cuckoo preferred nesting sites in younger riparian habitat which, when compared to mature woodlands, provided high productivity of invertebrate prey and reduced predator abundance (Layman 1998; McNeil et al. 2013; Carstensen et al. 2015; Stanek and Stanek 2012; Johnson et al. 2008). The dynamic transitional process of vegetation recruitment and maturity must be maintained to keep riparian habitat viable for this species over the long-term (USFWS 2014a).

Western yellow-billed cuckoos historically bred throughout riparian systems in western North America from southern British Columbia, Canada, to northwestern Mexico (Hughes 1999). In the past 90 years, the species' range in the western United States has contracted; the northern limit of breeding along the west coast is now in the Sacramento Valley, while the breeding limit in the western interior states is in southeastern Idaho (USFWS 2013). Within the three states with the highest historical number of yellow-billed cuckoo, past riparian habitat losses are estimated to be 90 to 95 percent in Arizona, 90 percent in New Mexico, and 90 to 99 percent in California (Ohmart 1994; USDOI 1994; Noss et al. 1995; Greco 2008). The primary factors threatening the western yellow-billed cuckoo are the loss and degradation of habitat for the species from altered watercourse hydrology and natural stream processes, livestock overgrazing, encroachment from agriculture, and conversion of native habitat to predominantly non-native vegetation. Additional threats to the species include the effects of climate change, pesticides, wildfire, and small and widely separated habitat patches (USFWS 2014a). Compared to conditions historically, the areas currently used for nesting by the western yellow-billed cuckoo are very limited and disjunct. The breeding population is small, with 680 to 1,025 nesting pairs (350 to 495 pairs in the United States and 330 to 530 nesting pairs in Mexico) and with no site exceeding 60 nesting pairs. Estimating numbers is problematic because an individual can nest in more than one location in a single year, possibly causing overestimates of the number of nesting pairs (USFWS 2014b). The current nesting population in California, based on surveys conducted in 2010, likely does not exceed 40 to 50 pairs found in only the three core locations. Core areas in California include (1) the Sacramento River between Colusa and Red Bluff; (2) the South Fork of the Kern River upstream of Lake Isabella; and (3) lower Colorado River (Laymon and Halterman 1987).

This species formerly nested in the Los Angeles, San Gabriel, and the Santa Clara River systems (Allen and Garrett 1996). Breeding persisted until at least 1952 in the San Gabriel River near El Monte (Long 1993; Garrett and Dunn 1981). No nesting of this species has been documented in Los Angeles County since the late 1950s, although breeding is still "conceivable" in remnant riparian habitat along the Santa Clara River (Allen and Garrett 1996). In recent years, yellow-billed cuckoos occur in Los Angeles County and elsewhere in the Southern California Coastal Region only as rare migrants (Lehman 2015; Unitt 2004; Hamilton and Willick 1996; Garrett and Dunn 1981; Webster et al. 1980). Although no recent breeding observations have been confirmed in the Southern California Coastal Region, multiple observations of yellow-billed cuckoos have been reported at some locations with suitable breeding habitat, including the lower Santa Clara River in Ventura County, the Whittier Narrows area in Los Angeles County, Prado Basin in Riverside and San Bernardino Counties, San Joaquin Marsh in Orange County, and San Luis Rey River near Oceanside in San Diego County. These observations generally consist of single birds and sometimes occur at times that suggest summering individuals rather than migrants (McCaskie and Garrett 2013, 2014, 2015, 2016).

On April 21, 2021, the USFWS published a rule designating proposed critical habitat for the western DPS of the yellow-billed cuckoo (USFWS 2021). This proposed rule designated approximately 298,845 acres in Arizona, California, Colorado, Idaho, New Mexico, Texas, and Utah. In California, critical habitat includes the Sacramento River (Colusa, Glenn, Butte, and Tehama Counties), and the South Fork Kern River Valley (Kern County) (USFWS 2021). The Biological Study Area is not located within the proposed designated critical habitat area for this species.

SURVEY METHODS

The USFWS survey protocol for western yellow-billed cuckoo requires a minimum of four surveys be conducted in three time periods that span the peak of breeding activity for the western populations of this species: (1) one survey is required from June 15 to June 30 when migrating yellow-billed cuckoos are passing through but breeding birds are also arriving; (2) two surveys are required from July 1 to July 31 when individual cuckoos encountered are mostly breeders but are occasionally migrants, wandering

individuals, or young of the year; and (3) one survey is required from August 1 to August 15 when most breeding yellow-billed cuckoos have finished breeding activities and are departing. Each survey needs to be conducted 12 to 15 days apart. Focused surveys were conducted by Lindsay Messett (TE-067064-5).

Ms. Messett systematically surveyed the riparian habitats by walking slowly and methodically along the margins of riparian habitat and using meandering transects through the riparian habitat in the survey area. Per USFWS survey protocol for the species, Ms. Messett played recorded contact or "kowlp" calls of western yellow-billed cuckoo five times at one-minute intervals at each calling station (or point) established in the survey area. Compact speakers capable of broadcasting recorded bird calls in excess of 70 decibels were used during all surveys. Upon arriving at each calling point, Ms. Messett listened and watched for cuckoos for one minute prior to playing the broadcast contact calls. Calling points were established approximately every 328 feet in riparian habitat that provided potentially suitable or marginally suitable habitat for the western yellow-billed cuckoo. All surveys were conducted under optimal weather conditions (i.e., between 55 degrees Fahrenheit [°F] and 95°F with wind speeds between 0 and 15 miles per hour) and during the morning hours when bird activity is at a peak (Table 1). Additionally, per USFWS guidelines, all incidental observations of least Bell's vireo (*Vireo bellii pusillus*) and willow flycatcher (*Empidonax trailli*) were recorded and mapped. All wildlife species detected during the surveys were recorded and are included in Attachment B.

TABLE 1
SUMMARY OF SURVEY DATA AND CONDITIONS FOR WESTERN YELLOW-BILLED CUCKOO SURVEYS

Survey No.	Survey Date	Surveyor	Time	Air Temperature (°F)		Cloud Cover (%)	Wind (mph)
				Start	End	Start/End	
1A	June 23, 2022	Messett	6:00 AM–10:50 AM	67	83	50/30	1–3
1B	June 24, 2022	Messett	6:15 AM–10:45 AM	55	80	0/0	0–6
2A	July 12, 2022	Messett	5:50 AM–11:00 AM	64	73	100/0	2–4
2B	July 13, 2022	Messett	5:45 AM–10:55 AM	63	72	100/0	1–2
3A	July 28, 2022	Messett	6:00 AM–11:05 AM	66	76	100/50	0–1
3B	July 29, 2022	Messett	6:05 AM–10:45 AM	67	78	90/75	4–5
4A	August 11, 2022	Messett	6:00 AM–10:30 AM	63	87	25/0	0–1
4B	August 12, 2022	Messett	5:54 AM–11:00 AM	70	82	25/10	0–4

(°F): Fahrenheit; %: percent; mph: miles per hour

RESULTS

No western yellow-billed cuckoos were observed in the survey area during the focused surveys. The required Yellow-Billed Cuckoo Survey Summary and Site Detection Forms are included as Attachment C.

Six other special status species were observed and/or detected in the survey area during the surveys: American white pelican (*Pelecanus erythrorhynchos*, California Species of Special Concern), bald eagle (*Haliaeetus leucocephalus*, State Endangered, California Fully Protected), least Bell's vireo (State Endangered, Federally Endangered), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*, California Department of Fish and Wildlife [CDFW] Watch List), yellow-breasted chat (*Icteria virens*, California Species of Special Concern), and yellow warbler (*Setophaga petechia*, California Species of Special Concern). These species are tracked by the CDFW's California Natural Diversity Database (CNDDB). The least Bell's vireo, yellow-breasted chat, and yellow warbler were all observed within riparian habitat; exhibits showing the location of these species and CNDDB forms documenting these species were included with the Results of Focused Presence/Absence Surveys for the Least Bell's Vireo and Southwestern Willow Flycatcher Report (Psomas 2022b). CNDDB forms for the remaining species were included with the Results of Focused Presence/Absence Surveys for the Coastal California Gnatcatcher Report (Psomas 2022a).

One to three brown-headed cowbirds were observed during the first two focused surveys on June 23 and 24; and July 12 and 13, 2022.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Lindsay Messett (Lindsay.Messett@psomas.com).

Sincerely,
PSOMAS

WILDLIFE COMPENDIUM

WILDLIFE SPECIES OBSERVED DURING SURVEYS

Species		Special Status
Scientific Name	**Common Name**	
AMPHIBIANS		
HYLIDAE - TREEFROG FAMILY		
Pseudacris cadaverina	California treefrog	
Pseudacris hypochondriaca	Baja California treefrog	
LIZARDS		
PHRYNOSOMATIDAE - SPINY LIZARD FAMILY		
Sceloporus occidentalis	western fence lizard	
SNAKES		
COLUBRIDAE - COLUBRID SNAKE FAMILY		
Pituophis catenifer	gophersnake	
BIRDS		
ANATIDAE - SWAN, GOOSE, AND DUCK FAMILY		
Branta canadensis	Canada goose	
Mareca americana	American wigeon	
Anas platyrhynchos	mallard	
Aythya affinis	lesser scaup	
Oxyura jamaicensis	ruddy duck	
ODONTOPHORIDAE - NEW WORLD QUAIL FAMILY		
Callipepla californica	California quail	
PODICIPEDIDAE - GREBE FAMILY		
Aechmophorus occidentalis	western grebe	
COLUMBIDAE - PIGEON AND DOVE FAMILY		
*Columba livia**	rock pigeon	
Zenaida macroura	mourning dove	
CUCULIDAE - CUCKOO AND ROADRUNNER FAMILY		
Geococcyx californianus	greater roadrunner	
CAPRIMULGIDAE - NIGHTJAR FAMILY		
Chordeiles acutipennis	lesser nighthawk	
TROCHILIDAE - HUMMINGBIRD FAMILY		
Calypte anna	Anna's hummingbird	
Selasphorus sasin	Allen's hummingbird	
CHARADRIIDAE - PLOVER FAMILY		
Charadrius vociferus	killdeer	
LARIDAE - GULL AND TERN FAMILY		
Larus occidentalis	western gull	
PHALACROCORACIDAE - CORMORANT FAMILY		
Phalacrocorax auritus	double-crested cormorant	
ARDEIDAE - HERON FAMILY		
Ardea alba	great egret	
Egretta thula	snowy egret	
Nycticorax nycticorax	black-crowned night-heron	
CATHARTIDAE - NEW WORLD VULTURE FAMILY		
Cathartes aura	turkey vulture	

WILDLIFE SPECIES OBSERVED DURING SURVEYS

Species		Special Status
Scientific Name	**Common Name**	
PANDIONIDAE - OSPREY FAMILY		
Pandion haliaetus	osprey	
ACCIPITRIDAE - HAWK FAMILY		
Haliaeetus leucocephalus	bald eagle	SE, FP
Buteo jamaicensis	red-tailed hawk	
STRIGIDAE - TYPICAL OWL FAMILY		
Megascops kennicottii	western screech-owl	
Bubo virginianus	great horned owl	
PICIDAE - WOODPECKER FAMILY		
Melanerpes formicivorus	acorn woodpecker	
Picoides nuttallii	Nuttall's woodpecker	
Colaptes auratus	northern flicker	
FALCONIDAE - FALCON FAMILY		
Falco sparverius	American kestrel	
Falco peregrinus	peregrine falcon	FP
TYRANNIDAE - TYRANT FLYCATCHER FAMILY		
Sayornis nigricans	black phoebe	
Tyrannus vociferans	Cassin's kingbird	
CORVIDAE - JAY AND CROW FAMILY		
Aphelocoma californica	California scrub-jay	
Corvus brachyrhynchos	American crow	
Corvus corax	common raven	
ALAUDIDAE - LARK FAMILY		
Eremophila alpestris actia	California horned lark	
HIRUNDINIDAE - SWALLOW FAMILY		
Stelgidopteryx serripennis	northern rough-winged swallow	
Petrochelidon pyrrhonota	cliff swallow	
AEGITHALIDAE - BUSHTIT FAMILY		
Psaltriparus minimus	bushtit	
TROGLODYTIDAE - WREN FAMILY		
Troglodytes aedon	house wren	
Thryomanes bewickii	Bewick's wren	
POLIOPTILIDAE - GNATCATCHER FAMILY		
Polioptila caerulea	blue-gray gnatcatcher	
Polioptila californica	California gnatcatcher	FT, SSC (subsp. californica)
SYLVIIDAE - SILVIID WARBLERS FAMILY		
Chamaea fasciata	wrentit	
MIMIDAE - MOCKINGBIRD AND THRASHER FAMILY		
Toxostoma redivivum	California thrasher	
Mimus polyglottos	northern mockingbird	
STURNIDAE - STARLING FAMILY		
*Sturnus vulgaris**	European starling*	

WILDLIFE SPECIES OBSERVED DURING SURVEYS

Species		Special Status
Scientific Name	**Common Name**	
FRINGILLIDAE - FINCH FAMILY		
Haemorhous mexicanus	house finch	
Spinus psaltria	lesser goldfinch	
PASSERELLIDAE - NEW WORLD SPARROW FAMILY		
Pipilo maculatus	spotted towhee	
Aimophila ruficeps	rufous-crowned sparrow	
Melozone crissalis	California towhee	
Melospiza melodia	song sparrow	
ICTERIDAE - BLACKBIRDS AND ORIOLES		
Sturnella neglecta	western meadowlark	
Icterus cucullatus	hooded oriole	
Agelaius phoeniceus	red-winged blackbird	
PARULIDAE - WOOD-WARBLER FAMILY		
Geothlypis trichas	common yellowthroat	
Setophaga coronata	yellow-rumped warbler	
MAMMALS		
SCIURIDAE - SQUIRREL FAMILY		
Otospermophilus beecheyi	California ground squirrel	
GEOMYIDAE - POCKET GOPHER FAMILY		
Thomomys bottae	Botta's pocket gopher	
CRICETIDAE - NEW WORLD RATS AND MICE FAMILY		
Neotoma bryanti	Bryant's woodrat	
LEPORIDAE - HARE AND RABBIT FAMILY		
Sylvilagus audubonii	desert cottontail	
CANIDAE - CANID FAMILY		
Canis latrans	coyote	
MEPHITIDAE - SKUNK FAMILY		
Mephitis mephitis	striped skunk	
PROCYONIDAE - PROCYONID FAMILY		
Procyon lotor	northern raccoon	
CERVIDAE - CERVID FAMILY		
Odocoileus hemionus	southern mule deer

Understory Vegetation: (provide percent estimate of the following dominant species).Use <1%; 10%, 25%, 50%, 75%, 90%, 100%.

	Cottonwood		Goodding's Willow		Coyote Willow	45	Other (specify) mustard
15	Tamarisk		Russian Olive		Other (specify)	40	Other (specify) nng
	Baccharis		New Mexico Oli				

Was surface water or saturated soil present at or adjacent to site within 300 meters? ☑ Yes ☐ No (circle one)

Was surface water or saturated soil present at or adjacent to all patches surveyed? ☑ Yes ☐ No (circle one)

Comments. Please provide comments regarding differences between the survey patches within the site. For example, if the average canopy for this site is 30% cover, but within one patch it is 60% cover - please note. Also, please note significant differences between dominant overstory and understory vegetation among the patches. Document these differences with photographs whenever possible. Make sure to reference comments to photo number whenever available.

The survey area for the western yellow-billed cuckoo includes all suitable riparian habitats (i.e., southern sycamore riparian woodland, southern black willow forest, disturbed southern black willow forest, and southern black willow forest/riparian herb) upstream of the Dam on the project site.

Specifically, western yellow-billed cuckoo surveys were conducted in portions of the survey area that contained suitable riparian habitat of appropriate size and stature. Riparian habitats were distributed throughout the survey area. These habitat types were generally dominated by Goodding's black willow (Salix gooddingii), red willow (Salix laevigata), arroyo willow (Salix laseolepis), Fremont cottonwood (Populus fremontii ssp. fremontii), western sycamore (Platanus racemosa), and white alder (Alnus rhombifolia). The understory and edges of these areas contained scattered mule fat (Baccharis salicifolia ssp. salicifolia), flatsedge (Cyperus sp.), broad-leaved cattail (Typha latifolia), saltcedar (Tamarix ramosissima), giant reed (Arundo donax), gum trees (Eucalyptus spp.), tree tobacco (Nicotiana glauca), and non-native grasses

Please provide USGS 7.5 minute quad (or similar)showing survey area to each survey form _____

EXECUTIVE SUMMARY

This report provides baseline data regarding the type and extent of jurisdictional resources for the Santiago Creek Dam Improvement Project. Jurisdictional resources considered for this report include wetland and non-wetland waters of the United States (WOTUS) regulated by the U.S. Army Corps of Engineers (USACE); waters of the State regulated by the Regional Water Quality Control Board (RWQCB); and waters, including the bed, bank, and channel of all lakes, rivers, and/or streams (and associated wetland and riparian vegetation), as regulated by the California Department of Fish and Wildlife (CDFW).

The limits of non-wetland WOTUS and waters of the State were identified by the presence of an Ordinary High Water Mark (OHWM). Wetland features were identified based on the USACE's three-parameter approach in which wetlands are defined by the presence of hydrophytic vegetation, hydric soils, and wetland hydrology indicators. There have been multiple changes to the definition of WOTUS in recent years resulting in substantial changes to areas under federal jurisdiction. The current definition of WOTUS excludes all waters that are not determined to be "relatively permanent" in their flow regime. Isolated drainages (i.e., those lacking connectivity to a downstream WOTUS) are also not considered WOTUS. The limits of waters of the State include ephemeral and isolated waters along with all WOTUS. The limits of CDFW jurisdictional waters were identified as either the top of bank or the outer drip line of riparian vegetation associated with the feature.

The jurisdictional delineation was performed by Psomas on March 24, 2020, for the portion of the survey area north (downstream) of the existing dam and on October 14, 20, and 21, 2020, for the portion of the survey area south (upstream) of the dam around Irvine Lake. Based on the results of the field work, and the most current regulatory guidelines, it was determined that the total amount of jurisdictional resources in the survey area are as follows:

- **USACE Jurisdiction:** 428.476 acres (101.706 acres wetland; 326.770 acres non-wetland)
- **RWQCB Jurisdiction:** 435.205 acres (101.706 acres wetland; 333.499 acres non-wetland)
- **CDFW Jurisdiction:** 669.630 acres

The proposed Project would consist of structural improvements to the dam, spillway, replacement of the outlet tower, and raising the spillway by six feet (i.e., two feet over the existing maximum water level with the flashboards installed). Based on preliminary project design, the following jurisdictional resources would be impacted by the Project[1]:

- **USACE Jurisdiction:**
    - 203.570 acres (wetland: 0.000 acre permanent, 63.915 acres temporary; non-wetland: 1.798 acres permanent, 137.857 acres temporary) and 0.673 acre

[1] The total impact by landowner (i.e., IRWD or County of Orange) is show in Attachment H.

within the additional inundation area (0.673 acre wetland; 0.000 acre non-wetland)

- **RWQCB Jurisdiction:**
    - 203.641 acres (wetland: 0.000 acre permanent, 63.915 acres temporary; non-wetland: 1.861 acres permanent, 137.865 acres temporary) and 0.711 acre within the additional inundation area (0.673 acre wetland; 0.038 acre non-wetland)
- **CDFW Jurisdiction:**
    - 233.774 acres (3.924 acres permanent, 229.850 acres temporary and 8.980 acres within the additional inundation area

The following permits/certifications/agreements are anticipated to be required for project impacts:

- USACE Section 404 Individual Permit
- RWQCB Waste Discharge Requirements
- CDFW Section 1602 Lake or Streambed Alteration Agreement

1.0 INTRODUCTION

This Jurisdictional Delineation Report (report) has been prepared to provide baseline data concerning the type and extent of water resources under the jurisdiction of the U.S. Army Corps of Engineers (USACE), the Regional Water Quality Control Board (RWQCB), and the California Department of Fish and Wildlife (CDFW) in support of the Santiago Creek Dam Improvement Project (hereinafter referred to as the "Project") proposed by the Irvine Ranch Water District (IRWD). This information has been reported in accordance with accepted scientific and technical standards that are consistent with the requirements of these agencies.

1.1 PROJECT LOCATION AND ENVIRONMENTAL SETTING

Santiago Creek Dam is located at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). The Project is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Existing structures include the embankment dam, outlet tower in Irvine Lake, spillway channel, flashboard storage shed, control house/outlet works, energy dissipater structure, dam keeper's house, a portion of the Irvine Lake pipeline, and dam access road (Exhibit 2).

The Project is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle map (Exhibit 3). It is within the Santa Ana Watershed. The drainage area for the Project encompasses approximately 63.4 square miles. The Project is within the Santa Ana Watershed (Hydrologic Unit Code 18070203). Irvine Lake (named the Santiago Creek Reservoir by the USGS) was originally constructed in 1931 to store water for the benefit of the surrounding communities.

Irvine Lake was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west, ultimately reaching the Santa Ana River. It has a relatively broad floodplain above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the Project site in the northwest, downstream of the dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the Project site. Elevations on the Project site range from approximately 657 to 996 feet above mean sea level (msl).

Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Orange County Waste and Recycling (OCWR) Landfill Facility (i.e., Santiago Canyon Landfill) is located adjacent to the west of Irvine Lake. Residential development is located west of SR-241.

The following vegetation types occur in the survey area: sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland, southern sycamore-coast live oak riparian woodland, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, and western sycamore. Other landcover includes cliff, open water, fluctuating shoreline, vegetated fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

1.2 PROJECT BACKGROUND

IRWD owns and operates Irvine Lake and the Santiago Creek Dam that serve as a critical water supply reservoir for IRWD's service area. The Santiago Creek Dam impounds water for Irvine Lake from Santiago Creek, local storm water runoff, and raw water from Metropolitan Water District of Southern California (MWD). It serves as a domestic and non-potable water supply for various cities in Orange County.

Irvine Lake is a reservoir of untreated water located east of Irvine Regional Park. The lake's capacity is currently approximately 24,000 acre-feet (AF) but it can hold an additional 2,700 AF when flash boards are installed on the spillway, temporarily raising the maximum water elevation an additional 4 feet to 795.9 feet. IRWD uses water from Irvine Lake for two purposes: 1) as a source of water for non-drinking purposes, such as irrigation uses, and 2) as a source of water for the Baker Water Treatment Plant, which produces drinking water for an estimated 85,000 homes in Orange County. IRWD can also provide water from Irvine Lake to Serrano Water District (SWD) through the Howiler Treatment Plan, which is owned and operated by IRWD, to serve SWD customers in the City of Villa Park and portions of the City of Orange. Per the terms of the Water Service Reliability Agreement executed between IRWD and SWD on December 12, 2024, IRWD can backstop and/or augment use of groundwater to enhance SWD's water supply reliability using water sourced from Irvine Lake. In the future, IRWD will construct an interconnection between SWD's and IRWD's potable system, which will allow IRWD to serve water from the Howiler Treatment Plant to IRWD customers. The construction and operation of the interconnection will be subject to separate environmental review.

Santiago Creek Dam is a compacted earthfill embankment completed in 1933 and certified by the State of California, Department of Water Resources (DWR), Division of Safety of Dams (DSOD), which identifies it as Dam No. 75-000. Santiago Creek Dam is located in Orange County, California and impounds water for Irvine Lake from Santiago Creek, a tributary to the Santa Ana River. Santiago Creek Dam is approximately 136 feet high and 1,425 feet long. It is roughly 760 feet wide at the base and contains approximately 800,000 cubic yards of materials. IRWD has appropriative rights to the flows of Santiago Creek including a right to diversion by storage in Irvine Lake for municipal, domestic, and agricultural uses. The reservoir provides flood control, water supply, fisheries enhancement, and recreational opportunities for the surrounding area. The existing silt level varies throughout the lake; however, it is estimated that the accumulated sediment currently occupies approximately 2,150 AF of the lake.

The sources of water for the Lake are flows from Santiago Creek, local runoff captured during rainfall events and untreated (imported) water purchased from MWD. The imported water is conveyed to the Lake through MWD's Santiago Lateral Pipeline (SLP). When water is drawn from the Lake from the existing outlet tower, water is conveyed via the Irvine Lake Pipeline (ILP) to downstream customers.

The outlet works for the dam consists of a tower, an outlet conduit, and a downstream control house. The outlet works are the normal means of releasing water impounded by the dam. The tower sits above the outlet pipe, or tunnel, and is used to transport water out of the reservoir. The outlet conduit conveys water from the reservoir through, under, or around a dam in a controlled manner. The downstream control house contains, or houses, electrical or other equipment. A concrete-encased welded steel pipe outlet conduit is located at the base of the outlet tower and runs beneath the dam to the toe of the dam where the pipeline splits in a bifurcation valve vault to permit water to flow into a 36-inch main pipe and 30-inch diverter pipe. The main pipe supplies water to IRWD and the Howiler Water Treatment Plant. The diverter pipe can release water from the lake into the streambed immediately downstream of the control house for dam safety purposes.

The existing dam spillway[2] is a reinforced concrete structure located on the left abutment of the dam and consists of an approach, broad-crested weir control structure, chute, and flip bucket at the downstream end. The spillway has vertical reinforced concrete walls through the length and a bridge structure with piers at the spillway crest. The spillway crest is located at elevation 791.9 feet. Historical records of spillway flows at Santiago Creek Dam indicate that the spillway has flowed 24 times between 1937 and 2019 (82 years).

Irvine Lake is held at varying levels depending on the time of year. In the wet winter months, water can be stored up to the 791.9-foot elevational contour[3]. The height of the existing spillway with flashboards installed is at the 795.9-foot elevation contour; this is the current maximum capacity of the reservoir and is only permitted in the summer months. Historically, the inflow into the reservoir during storm events is high enough to cause the water to flow over the spillway crest, located at the 791.9-foot elevation, approximately once every four to five years (1937 to 2019). From October 2002 to September 2020, the reservoir has been filled to the spillway crest four times and water has been high enough to flow over the spillway twice. The water levels in the lake during this period (2002 to 2020) fluctuated between the approximately 736-foot elevation contour and the 795-foot elevation contour. Between 2002 and 2020, the longest consecutive period of time that water was stored in the upper two feet of the reservoir (i.e., 793.9 to 795.9 feet) was approximately 35 days.

1.3 PURPOSE AND NEED

In 2012, and in collaboration with DSOD, IRWD initiated seismic evaluations of the existing outlet tower that resulted in a determination that the free-standing structure was seismically unstable. In 2017, at the request of DSOD, IRWD initiated a multi-phase spillway condition assessment. The assessment found that the spillway is nearing the end of its useful life and

[2] A spillway is a structure on a dam that allows water to flow around the dam to safely release excess water from a reservoir.

[3] NAVD88 Datum is used throughout this document.

its design, while acceptable at the time of construction, does not meet current design standards (URS 2015). IRWD has also conducted an assessment of seismic performance of the dam embankment and has determined that modifications to the Santiago Creek Dam embankment are necessary.

In view of the findings of the seismic evaluation for the existing outlet tower and dam embankment, as well as the comprehensive assessment of the existing spillway, IRWD has elected to develop designs for an inclined outlet structure that will be placed near the left abutment of the existing dam, to modify the embankment, and to replace the existing spillway with a side-channel spillway on the left abutment. The spillway crest will also be raised by six feet, which is two feet higher than the top of the flashboards when installed, to regain operational storage capacity that was lost over the years due to sedimentation. The existing outlet tower would be demolished, and the new inclined outlet structure would connect to the existing outlet conduit within the reservoir. The dam embankment would be modified to include a filter drain system.

1.4 PROJECT OBJECTIVES

The primary objective of the proposed Project is to rehabilitate and replace the Santiago Creek Dam outlet tower and spillway facilities to modify the dam embankment to permit operation of the facilities to provide for a long-term water resource benefit. In implementing the proposed Project, IRWD would also obtain the following benefits:

- Construct new facilities and dam embankment modifications that will meet or exceed the current seismic, safety, and design requirements established by DSOD, which is the governing state agency associated with this Project;
- Satisfy IRWD's operational requirements in the present and the future;
- Extend the useful life of the facilities;
- Improve regional water supply reliability; and
- Minimize impacts to local environmental resources and surrounding property owners.

1.5 PROJECT DESCRIPTION

General elements of each portion of the Project are included below. A more detailed description of the proposed facilities is included in the Environmental Impact Report (EIR). The Project Description represents a conservative analysis to accommodate the range of uncertainty regarding the final design. Therefore, the quantities and measurements used throughout the analysis are estimates based on the best available information.

- The existing outlet tower would be demolished; with the portion of the tower located below the sediment to be filled with concrete and capped with a concrete plug or completely removed. A new inclined outlet structure would be constructed on the left abutment, including an approximately 54-inch steel pipe inclined along the slope that would act as the conveyance pipe for water into and out of the reservoir. The concrete-encased steel pipe would be situated in firm bedrock and anchored to the

slope by drilled foundation anchors. A series of steel riser pipes would extend vertically from the inclined 54-inch steel pipe and would act as intakes for reservoir water into the 54-inch pipe. Each riser would include an intake fish screen that would inhibit debris, silt, and aquatic life from entering the pipe.

- The inlet/outlet works would be configured to incorporate the new structure, including new valves and fittings. Water from the lake would enter into the new inclined inlet/outlet structure and would convey lake water through an existing conduit under the dam. At the downstream toe of the dam, a new fitting would be installed to bifurcate the flow either to the ILP or the emergency outlet pipeline. Water that enters the ILP would reach IRWD's distribution system. Water that enters the emergency outlet pipeline would be released to the creek at the end of the new spillway.
- The ILP would be increased from 36 inches to 54 inches to match the pipeline coming from the inclined inlet/outlet structure, as well as to increase the capacity of the line to improve the system's hydraulics. The relocation and upsizing improvements would also protect the ILP from future flood events, thereby enhancing the overall reliability of delivering water from Irvine Lake to customers.
- The existing spillway would be demolished and replaced with a new side-channel spillway in a rock cut on the left abutment. The alignment for the new spillway was selected as a result of several constraints including the footprint of the dam embankment, the location of the sloped outlet structure, and the steeply sloped hillside along the left abutment.
- To ensure the spillway structure is constructed on sound foundational material, many areas under the spillway structure would include the placement of roller compacted concrete. In addition, the floor of the spillway would be anchored into bedrock materials that would include drilling, grouting, post-tensioning and securing the anchors into the spillway slab.
- The end of the new spillway would include a stilling basin before discharging to a concrete and riprap apron. At the end of the stilling basin, a scour protection cutoff is included for additional mitigation of head cutting that may occur during significant discharges.
- The dam embankment improvements include removing the upper portion of the dam on the downstream side of the embankment, constructing a filter drain system, and encapsulating the filter drain system with embankment shell material composed of pervious material.
- A new access road and ramp would be constructed to provide vehicle access to the new inlet/outlet structure. A new shotcrete tie-back wall would be needed to cut the roadway into the existing slope without affecting the existing landfill facility above.
- A new dam control building would be constructed to house the valve system at the end of the existing dam crest. The preliminary layout shows a fire-hardened building with the approximate dimensions of 60 feet by 20 feet with a height of approximately 18 feet.

- The dam crest would be widened from 10 feet to between approximately 35 and 45 feet, the dam crest elevation would be raised approximately one foot, which would improve access and safety for dam maintenance. The paved dam crest would include protective railings on both sides of the road and replacement of piezometers to monitor the performance of the embankment dam. These embankment improvements would require excavations along the toe of the dam to key in the earthwork improvements to the face of the dam.
- The dam crest would be raised approximately one foot on the upstream side of the dam crest. This would raise the effective dam crest from an elevation of 811.9 feet up to approximately 812.9 feet for DSOD freeboard requirements during a probable maximum flood event.
- The Project would raise the spillway six feet to 797.9 feet, which is two feet higher than the existing maximum water storage elevation of 795.5 feet. Raising the spillway would allow the dam to impound water up to the 797.9-foot elevation contour year-round, which would allow storage of approximately 1,300 AF of additional water.
- A new emergency access walkway (five feet wide) and stair system would be constructed along the left wall of the new spillway channel to reach the inlet/outlet structure and dam crest from the adjacent closed OCWR landfill facility during a spillway event. The walkway would connect to the new access road (described above).
- A new steel bridge structure would be included for vehicles across the new spillway.
- Existing structures would be demolished, including the existing vertical outlet tower and portions of 60-inch outlet conduit, significant portions (or possibly all) of the existing spillway chute and walls, spillway bridge and piers, portions of the upstream dam embankment concrete facing, storage building on the dam crest, outlet works control building and valve vault, outlet works energy dissipator vault, portions of the ILP, catwalk and stairs assembly across Santiago Creek, the dam keeper's house, boat shop (unless re-purposed for IRWD use), and piezometers/monitoring wells. Site demolition activities are anticipated to occur in 2027/2028, and spillway demolition is expected to occur in 2028. The potential removal of the boat shop building would occur at the end of the construction period in 2030. When feasible, demolished materials would be recycled or reused.
- The existing Southern California Edison (SCE) overhead power lines and power poles in the vicinity would be relocated outside the construction limits. This relocation would be completed by SCE. There would be an approximately 15-foot-wide right-of-way (ROW) easement for long-term maintenance.
- Before beginning construction of the dam improvements, the lake would be dewatered, and an access road would be graded along the edge of the dewatered lakebed to allow construction access between the staging area and the dam structure.
- IRWD would maximize withdrawals from Irvine Lake in the time leading up to construction initiation to minimize the amount required to be dewatered. The dewatering process would combine several methods including dewatering using the valves and outlet tower to allow water to flow downstream, implementing a

temporary pumping system, and installing a subgrade dewatering system (e.g., dewatering wells). The temporary pumping system would include diesel-driven pumps and temporary above ground piping that would convey the water from the lake to a discharge point along Santiago Creek near the existing Arizona crossing (a type of culvert crossing). Dewatering would be used throughout the year as needed to manage the water level during and after storm events and to maintain a dry work environment. IRWD would coordinate downstream releases with impacted agencies and entities.

- Once the lake is dewatered and before the first dry season, the contractor would construct a temporary diversion berm and access ramp. The temporary diversion would provide a physical barrier to protect the work area from seasonal storms and would provide an elevated access road to allow construction equipment to access the downstream side of the dam.
- During construction, concrete crushing would occur in one of the staging areas. Concrete crushing would be expected to occur intermittently for approximately three weeks during the demolition phase of the Project but may also occur at various stages of the Project as concrete is removed from the existing spillway or dam. When feasible, demolished and removed materials would be recycled or reused.

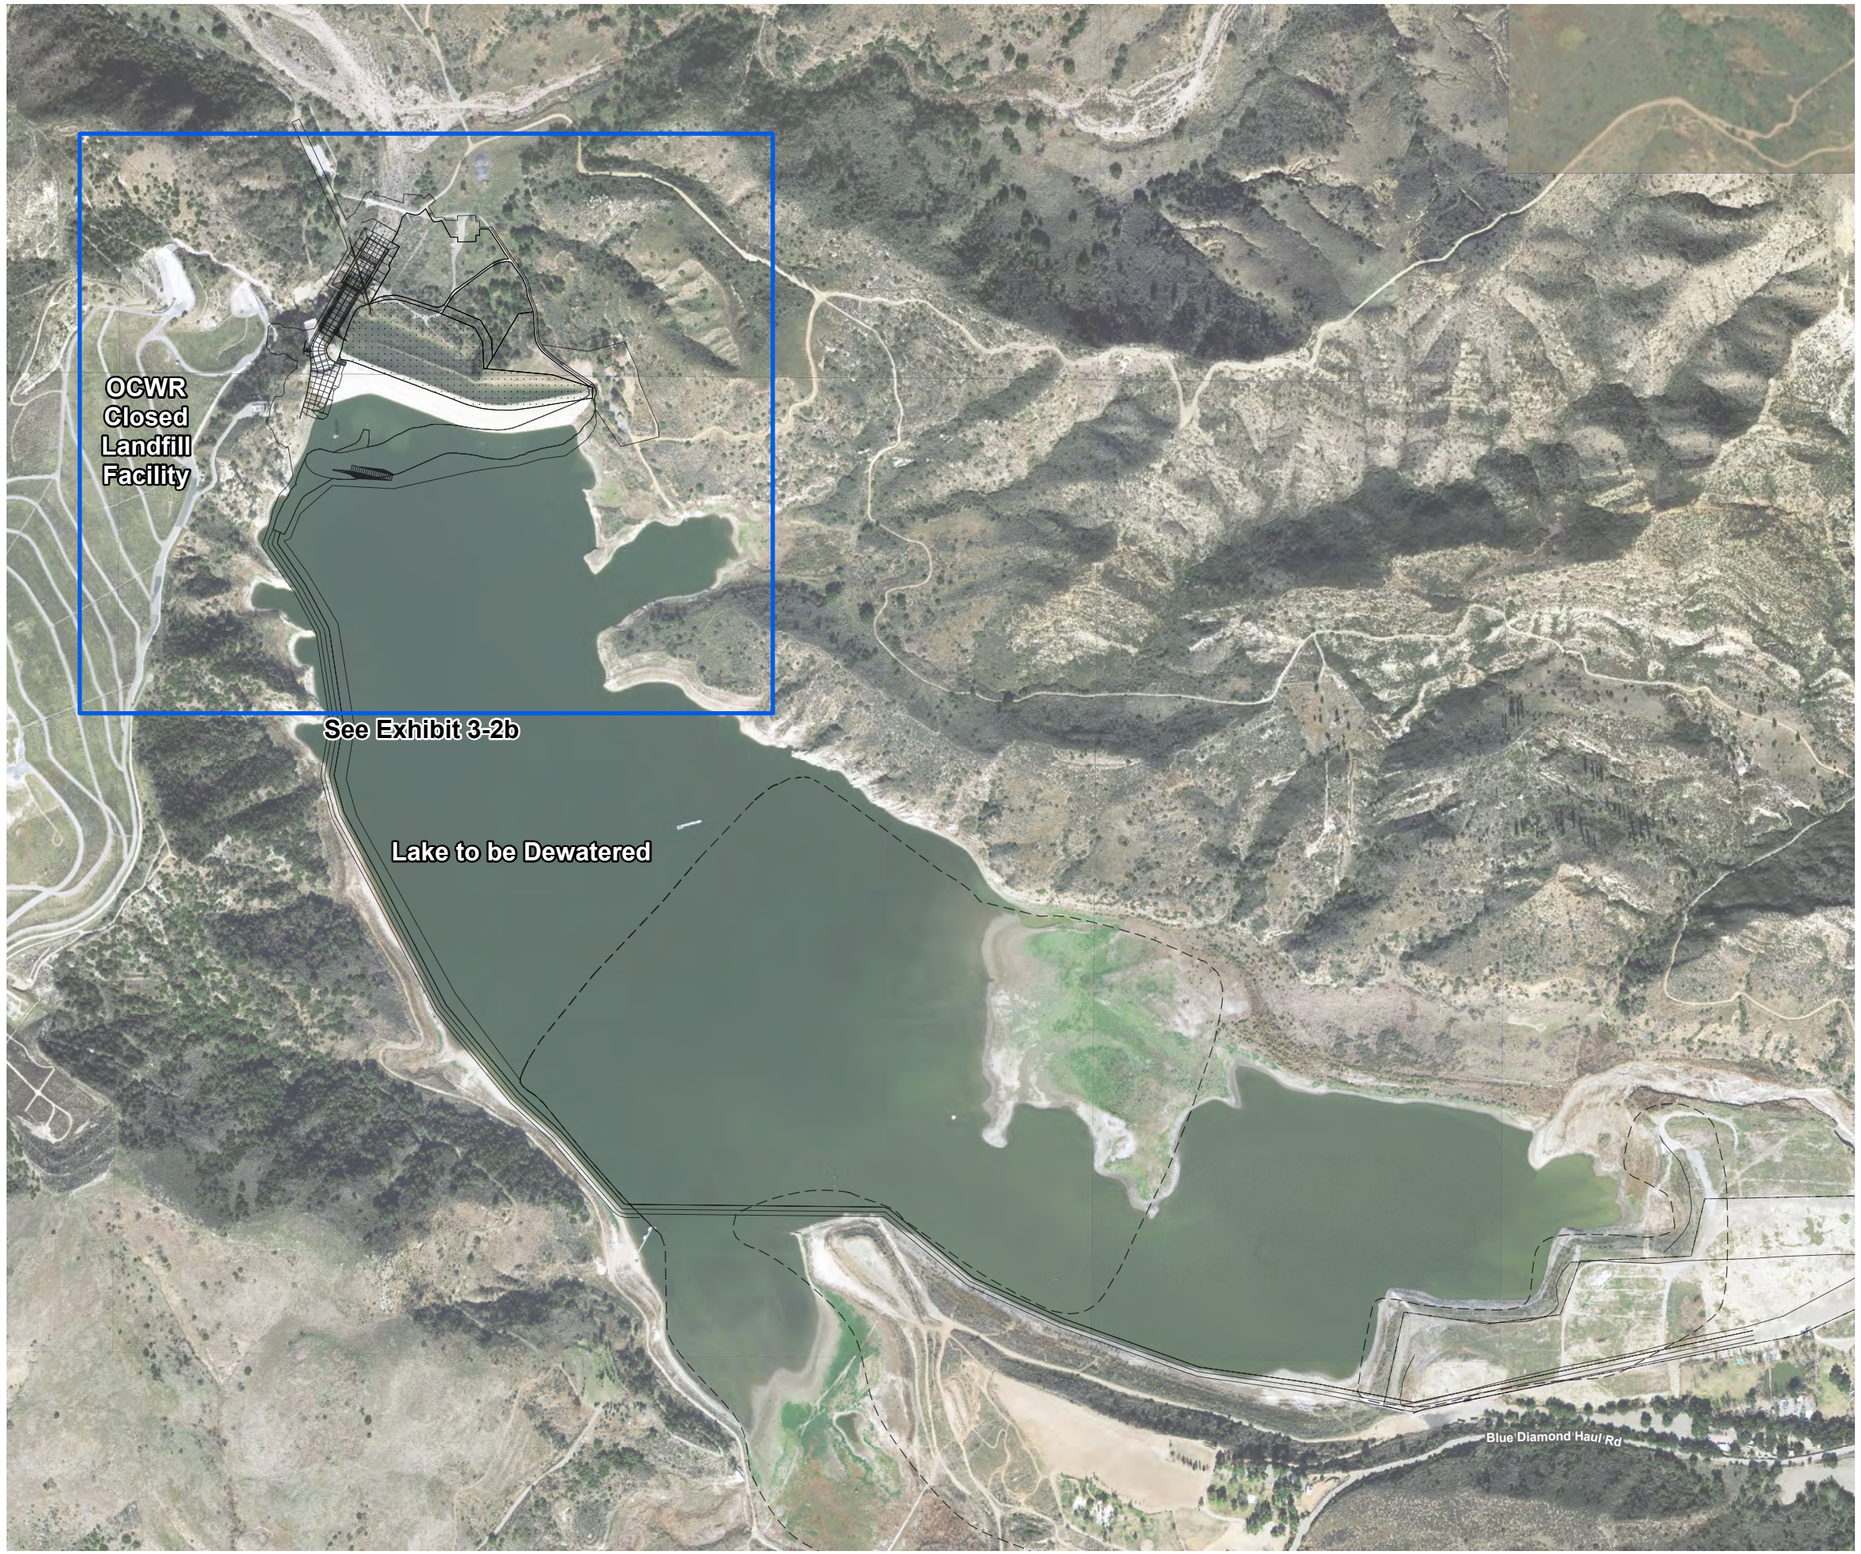
1.5.1 Additional Geotechnical Investigations

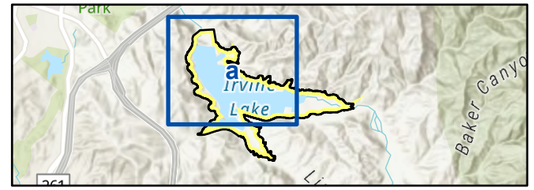
Although IRWD previously completed geotechnical investigations to support Project design and the development of detailed construction documents (2021–2024), additional geotechnical investigations were conducted in early 2025 to support the final design. These investigations included the performance of exploratory test pits, soil borings, packer testing, and non-intrusive geologic investigations and observations. The additional geotechnical investigations remained within the proposed limits of disturbance defined by the Project and will be mitigated as part of the overall Project.

1.5.2 Construction Activities

Construction Access and Staging

The primary construction access would lead into the lake from Santiago Canyon Road and Blue Diamond Haul Road. The primary contractor staging and equipment storage area, as well as the required concrete batch plant and construction trailers, would be located in the large, flat plateau area (known as “the Flats”) at the upstream end of the reservoir (Exhibit 4). The primary construction access/haul road would connect the staging area to the existing dam within the lakebed after the lake is dewatered. An earthen ramp would be constructed up the right abutment of the existing dam to allow construction vehicles to access the downstream side of the dam. To facilitate construction of the downstream features, a secondary staging area would be located on the downstream toe of the dam near the existing outlet structure building. It is anticipated that the secondary staging area would be utilized by the contractor to mobilize the roller compacted concrete batch plant. The secondary staging area may also be used to stage formwork, rebar, raw materials, and other related materials and equipment required to successfully construct the dam improvements. Material from the embankment would be removed, staged, and repurposed within the Project site.





Irvine Lake would be partially or fully dewatered prior to construction of the access road across the dry lake bottom.

Temporary Construction Water

Water would be utilized for various construction activities. The available water source in the Project vicinity is a 12-inch potable water line running along East Santiago Canyon Road south of Irvine Lake. IRWD would install a temporary highline from Santiago Canyon Road, along Blue Diamond Haul Road to the staging area. The temporary construction water line would be routed above-ground through the Irvine Lake parking area and along the primary contractor access/haul road to the proposed work areas. Construction activities may also use untreated water from the ILP as an additional water source.

Borrow Areas

Project construction would involve the removal and on-site transport of approximately 360,000 cubic yards (CY) of soil from on-site borrow pits, located within the limits of the lake, to serve as source material for the dam embankment. These materials would be moved from one on-site location to another and ultimately balanced on-site. The Project would include importing approximately 200,000 CY of material and exporting approximately 315,000 CY of material over the four-year construction period.

Construction Schedule

Construction work is anticipated to begin in Fall 2027 and the Project is expected to be completed within approximately four years. The approximately four-year construction window assumes down-time associated with weather restrictions and assumes working double 10-hour shifts (i.e., 20-hour workdays with nighttime work). The construction schedule assumes that a minimum of three dry seasons, which are generally between April to October, would be required to build the dam improvements in a systematic and phased fashion. It also assumes that the embankment improvements would be built concurrently with the spillway improvements. The exact date that construction begins is subject to change. The construction schedule will be refined as Project design plans are developed and finalized.

During construction, concrete crushing would occur in the staging area at the upstream end of the lake. Concrete crushing would be expected to occur during the day from April through November during the demolition phase of the Project. As mentioned above, concrete crushing would be expected to occur intermittently for approximately three weeks during the demolition phase of the Project but may occur at various stages of the Project as concrete is removed from the existing spillway or dam.

Various public agencies (e.g., Orange County Fire Authority, Orange County Sheriff's Department, etc.) currently use portions of the proposed staging area for takeoff and landings associated with training and operational activities. During construction of the proposed Project, HeloPods[4] would be designated near the eastern edge of the lake near the Flats area at the upstream end of the reservoir for their continued use.

[4] Portable, tactical helicopter dip sources which provide fire crews a water source to refill the helicopters water tanks closer to the location of a wildfire.

1.6 OPERATION AND MAINTENANCE

Once operational, all Project components would operate and be monitored through IRWD's Supervisory Control and Data Acquisition (SCADA) system. Reservoir level sensors would continue to monitor water levels in the reservoir. In addition, instrumentation and monitoring systems would continuously monitor the stability of the dam and identify situations that may require intervention, such as a controlled emergency release of water from the reservoir. Any upgrades to instrumentation and monitoring equipment would be determined during final design and may include, but are not limited to, survey monuments, inclinometers, seepage weirs, piezometers, reservoir level sensors, strong motion accelerographs, and a weather station.

Irvine Lake is generally operated in four IRWD operational modes as outlined in Table 1. Each mode has general operating parameters that allow for the safe, cost-effective operation of the lake while maximizing the potential average annual water runoff from storm events.

TABLE 1
IRWD/LAKE OPERATIONAL MODES

Season	
Winter	During the Winter Mode any available rainfall is captured in the lake and stored for use. This period begins with the first rainfall event in November/December and reduces or eliminates the need to purchase untreated imported water from MWD if runoff equals or is greater than demands.
Spring	During the Spring Mode under the first option, lake storage is evaluated to determine if available runoff captured during the winter will meet demands through October 1. If additional water is needed during a dry year, untreated imported water from MWD is purchased prior to May 1. Under the second option, water is not purchased prior to the summer season.
Summer	During the Summer Mode beginning May 1, under the first option, the lake is drafted down to meet IRWD demands. Under the second option water is purchased on a month-by-month basis to meet demands, which minimizes evaporation losses applied to imported supplies.
Fall	During the Fall Mode beginning October 1, purchased untreated imported water from MWD is used to maintain the Lake at the minimum operational level while maximizing available storage. Once sufficient runoff is received to meet demands or to begin filling the lake, staff transitions to the Winter Mode.
Under some water level and rain event conditions, the spillway may be utilized to pass storm flows around the dam. When the spillway is activated, the emergency outlet valve to Santiago Creek may be opened to release water and lower the water level in the reservoir and orders for untreated imported water are ceased. Source: IRWD 2020.	

Similar to the current reservoir, operation of the proposed Project would not require daily onsite staffing but would require only periodic maintenance. Water levels at Irvine Lake would fluctuate seasonally; water would be stored in winter when water supply exceeds demand, and the reservoir would be drawn down in summer when water demand exceeds supply. However, IRWD would develop a new operating plan for Irvine Lake that would be

updated each year to set targets for the volume of water to be contained in the reservoir on a daily, monthly, annual, or seasonal basis. Reservoir operations would vary with time based upon a wide variety of factors, such as: seasonal storage needs, water quality considerations, and impoundment requirements based on rainfall projections.

During precipitation events, IRWD may maintain reservoir levels well below the spillway crest to create sufficient space for stormwater runoff to enter the reservoir and avoid use of the spillway. The annual operating plan would identify an operating strategy that would reduce the potential for utilizing the spillway and maximize stormwater capture. Reservoir operations would be adjusted by IRWD during the year based on changes in projected demands and other factors as needed.

Under normal operating conditions, all flow out of the reservoir would be conveyed through the inlet/outlet pipeline. In the event of an emergency or for dam safety reasons, IRWD would release water through the cone valve to the creek. IRWD staff would continue to conduct routine safety and security checks of the site, similar to existing protocols.

1.6.1 Additional Inundation During Operation

The Project includes raising the spillway six feet to 797.9 feet, which is 2 feet higher than the existing maximum water storage elevation with the flashboards installed (759.9 feet). Raising the spillway would allow the lake to impound water up to the 797.9-foot elevation contour year-round, which would allow storage of approximately 1,300 AF of additional water. Under current operations, if Irvine Lake was full and the water was conveyed to the Baker Water Treatment Plant at full production while also feeding the Howiler Water Treatment Plant, the water level in the lake would be lowered by approximately 2 feet in approximately 18 days, assuming no additional inflow into the reservoir and excluding evaporation. IRWD estimates that the upper 2 feet of the reservoir (i.e., 795.9 to 797.9 feet in elevation) could be inundated for an approximate maximum of 30 to 45 days per year but typically would be inundated less often, and in some years not at all. As previously discussed, the existing lake capacity is currently approximately 24,000 AF, but it can hold an additional 2,700 AF when the flash boards are installed on the spillway. With proposed improvements, the lake would hold a maximum of 28,000 AF.

Other than raising the spillway, all other operations would remain similar to the existing operations of the dam.

1.7 REGULATORY AUTHORITY

This section summarizes the regulations of those federal and state agencies that have regulatory authority over activities that occur within their areas of jurisdiction. A detailed explanation of each agency's regulatory authority is provided in Attachment A.

1.7.1 U.S. Army Corps of Engineers

The USACE Regulatory Branch regulates activities that discharge dredged or fill materials into waters of the United States (WOTUS) under Section 404 of the federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. The USACE's authority applies to all

WOTUS where the material (1) replaces any portion of a WOTUS with dry land or (2) changes the bottom elevation of any portion of any WOTUS. Activities that result in fill or dredge of WOTUS require a permit from the USACE.

The definition of WOTUS has been the subject of shifting regulations. Past federal revisions to regulations addressing the extent of USACE jurisdiction and the definition of WOTUS have been issued by the Obama Administration in 2015 and the Trump Administration in 2020. On January 18, 2023, the United States Environmental Protection Agency (USEPA) published a final Water Rule in the Federal Register that went into effect on March 20, 2023 ("the 2023 Rule") (USACE and USEPA 2023a).

The definition of WOTUS changed again in response to the Supreme Court decision in the case of *Sackett v. USEPA*. On September 8, 2023, the USEPA and the USACE amended the Code of Federal Regulations to conform the definition of WOTUS to the Supreme Court decision (USACE and USEPA 2023b). This conforming rule amends the provisions of the agencies' definition of WOTUS that were invalid under the Supreme Court's interpretation of the CWA under *Sackett*.

Based on these changes, tributaries must have at least relatively permanent flow to be considered WOTUS from the federal definition. This would exclude ephemeral drainages from being WOTUS. This represents a substantial change to areas under federal jurisdiction in the arid west. This report provides interpretations of WOTUS under the Amended 2023 Rule. The current definition of WOTUS is provided in Attachment A.

1.7.2 Regional Water Quality Control Board

The State Water Resources Control Board (SWRCB), in conjunction with the nine RWQCBs, is the primary agency responsible for protecting water quality in California through the regulation of discharges to surface waters under the CWA and the California Porter-Cologne Water Quality Control Act (Porter-Cologne Act). The SWRCB's and RWQCBs' jurisdictions extend to all WOTUS as well as waters of the State that are outside federal jurisdiction, including wetlands.

The Porter-Cologne Act broadly defines "waters of the State" as any surface water or groundwater, including saline waters, within the boundaries of the State." On August 28, 2019, the Office of Administrative Law (OAL) approved the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to waters of the State. The procedures went into effect on May 28, 2020. Under these regulations, the SWRCB and its nine RWQCBs assert jurisdiction over all existing WOTUS, and all waters that would have been considered WOTUS under any historical definition. Impacts to WOTUS are authorized by the RWQCBs through a Water Quality Certification per Section 401 of the CWA. For isolated waters (i.e., waters that are not subject to USACE jurisdiction under section 404 of the CWA) the state takes jurisdiction under the Porter-Cologne Act. The permit required for impacts to waters of the state is a Report of Waste Discharge (ROWD).

To obtain ROWDs, file the ROWD Form 200 with the necessary supplemental information with the RWQCB at least 120 days before beginning to discharge waste. The RWQCB reviews the application for completeness and may request additional information. Once the

application is complete, the RWQCB determines whether they should adopt Waste Discharge Requirements (WDRs), prohibit the discharge, or waive the WDRs. If WDRs should be issued, the RWQCB prepares proposed WDRs and distributes them to persons and public agencies with known interest in the project for a minimum 30-day comment period. RWQCB staff members may modify the proposed WDRs based on comments received from the discharger and interested parties. The RWQCB holds a public hearing with at least a 30-day public notification. The RWQCB may adopt the proposed WDRs or modify and adopt them at the public hearing by majority vote. The entire process for developing and adopting the requirements normally takes about three months. WDRs are in effect until such time as the discharge is terminated or until revoked by the RWQCB. NPDES permits expire after five years and must be reissued.

There is no application fee for Form 200 (except for dairies). Instead, there is an annual fee that will be paid to the RWQCB.

1.7.3 California Department of Fish and Wildlife

The CDFW regulates activities that may affect rivers, streams, and lakes pursuant to the *California Fish and Game Code* (§§1600–1616). According to Section 1602 of the *California Fish and Game Code,* the CDFW has jurisdictional authority over any work that will (1) substantially divert or obstruct the natural flow of any river, stream, or lake; (2) substantially change or use any material from the bed, channel, or bank of any river, stream, or lake; or (3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake. A Lake or Streambed Alteration (LSA) Agreement would be required for the aforementioned activities.

2.0 METHODS

2.1 SURVEY AREA

The survey area for the jurisdictional delineation includes the perimeter of Irvine Lake and an area north (downstream) of the dam (Exhibit 3). The survey area north of the dam was provided by IRWD and the survey area south of the dam was determined by adding a 250-foot buffer from the 797.9-foot elevation contour around the lake. Where the 250-foot buffer did not include the 811.9-foot contour, the survey area was extended 50-feet beyond the 811.9-foot contour to assess indirect effects on biological resources[5]. The survey area was truncated at the ridgeline around Irvine Lake and at Santiago Canyon Road because no impacts are expected to extend past the ridgeline or arterial roadway, respectively.

2.2 LITERATURE REVIEW

Prior to conducting the jurisdictional delineation and during report preparation, Psomas reviewed the following documents to aid in the identification of areas that may fall under agency jurisdiction: the USGS' Black Star Canyon 7.5-minute quadrangle map, color aerial photography provided by the Hexagon Geosystems (flown in 2017 and 2018) and ESRI, Maxar (flown in 2019); soil data provided by the U.S. Department of Agriculture's Natural Resources Conservation Service (Exhibit 5); the National Hydric Soils List (USDA NRCS 2020); the National Wetlands Inventory's Wetland Mapper (Exhibit 6); the USGS National Water Information System Mapper (USGS 2020a); and the Water Quality Control Plan for the Santa Ana River Basin (Santa Ana RWQCB 1995).

USGS Topographic Quadrangle. USGS quadrangle maps show geological formations and their characteristics and describe the physical settings of an area through topographic contour lines and other major surface features. These features include lakes, streams, rivers, buildings, roadways, landmarks, and other features that may fall under the jurisdiction of one or more regulatory agencies. In addition, the USGS maps provide topographic information that is useful in determining elevations; connectivity of streams, rivers, and other water features; latitude and longitude; and Universal Transverse Mercator Grid coordinates for the survey area.

Color Aerial Photography. Color aerial photographs were reviewed prior to conducting the field delineation to identify the extent of any drainages and riparian vegetation occurring in the survey area.

U.S. Department of Agriculture, Natural Resources Conservation Service. The presence of hydric soils is one of the chief indicators of jurisdictional wetlands. Psomas reviewed U.S. Department of Agriculture (USDA) soil data for the survey area.

U.S. Fish and Wildlife Service, National Wetlands Inventory: The Wetlands Mapper shows wetland resources available from the Wetlands Spatial Data Layer of the National

[5] The study area extended to the 811.9-foot elevation because the impact boundary had not yet been developed when the surveys began.

Spatial Data Infrastructure (USFWS 2020). This resource provides the classification of known wetlands following the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC 2013). This classification system is arranged in a hierarchy of (1) Systems that share the influence of similar hydrologic, geomorphologic, chemical, or biological factors (i.e., Marine, Estuarine, Riverine, Lacustrine, and Palustrine); (2) Subsystems (i.e., Subtidal and Intertidal; Tidal, Lower Perennial, Upper Perennial, and Intermittent; or Littoral and Limnetic); (3) Classes, which are based on substrate material and flooding regime or on vegetative life forms; (4) Subclasses, which recognize finer differences in life forms or substrate material than the Class; and (5) Dominance Types, which are named for the dominant plant or wildlife forms. In addition, modifying terms are applied to Classes or Subclasses. Full definitions of National Wetland Inventory (NWI) terms are found in Attachment B.

The mapped water resources are used to provide additional guidance on planning the field surveys. Given that wetland features mapped by the NWI may or may not exist at a site because of changing conditions and development, this resource provides only preliminary data and historic data based on aerial photographic interpretation and, therefore, must be ground-truthed.

USGS National Water Information System Mapper. The National Water Information System Mapper provides data from surface water sites, groundwater sites, springs, and atmospheric sites. Available data from surface water sites include daily, monthly, and annual discharge; peak streamflow; and water-year summaries.

Regional Water Quality Control Plans. California has nine RWQCBs. The survey area is located in RWQCB Region 8, the Santa Ana Region. The Santa Ana RWQCB has adopted a Water Quality Control Plan (or "Basin Plan") for this region. The Basin Plan contains goals and policies, descriptions of conditions, and proposed solutions to surface and groundwater issues. The Basin Plan also establishes water quality standards for surface and groundwater resources and includes beneficial uses and levels of water quality that must be met and maintained to protect these uses. These water quality standards are implemented through various regulatory permits pursuant to the CWA, specifically Section 401 for Water Quality Certifications and Section 402 for Report of Waste Discharge (ROWD) permits.

2.3 JURISDICTIONAL DELINEATION

The analysis contained in this report relies on a jurisdictional delineation conducted by Psomas on March 24, 2020, for the portion of the survey area north (downstream) of the existing dam and on October 14, 20, and 21, 2020, for the portion of the survey area south (upstream) of the dam around Irvine Lake. Psomas Senior Regulatory Specialist Allison Rudalevige performed all surveys with assistance from Psomas Senior Biologist Jonathan Aguayo on October 14 and 20, 2020, and Psomas Senior Biologist Lindsay Messett on October 21, 2020. Areas under USACE, RWQCB, and CDFW authority were delineated using an aerial photograph (scale of 1-inch equals 175 feet [1″ = 175′] north of the dam and scale of 1-inch equals 275 feet [1″ = 275′] south of the dam) overlaid with 5-foot topographic contour data loaded onto Avenza Maps application on an Apple iPad. Large drainage features and waterbodies were delineated as polygons and narrow drainages were delineated as centerlines with corresponding width measurements. Soil test pits were dug in areas that

exhibited potential hydrophytic vegetation and wetland hydrology. Representative photographs of the survey area are included in Attachment C.

2.3.1 USACE Waters of the United States

Psomas assessed the presence of WOTUS by determining connectivity or adjacency of on-site features to points of discharge at Traditional Navigable Waters (TNW) and whether they are relatively permanent tributaries or wetlands adjacent to such waters that meet the current definition of WOTUS. Non-wetland WOTUS are delineated based on the limits of the OHWM, which can be determined by a number of factors, including (1) the presence of a clear, natural line impressed on the bank; (2) shelving; (3) changes in the character of the soil; (3) destruction of terrestrial vegetation; and (4) the presence of litter and debris. The OHWM limits of drainages occurring in the survey area were further verified using methods contained in *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States*, *A Delineation Manual* (Lichvar and McColley 2008) and the *Updated Datasheet for the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Curtis and Lichvar 2010). The elevation of the median reservoir level (as recorded between 2002 and 2020) was used to determine the OHWM limits around Irvine Lake.

In September 2008, the USACE issued the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008). This Regional Supplement is designed for use with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987). Both the 1987 Wetlands Manual and the Arid West Supplement to the manual provide technical methods and guidelines for determining the presence of wetland WOTUS. Both documents prescribe using a three-parameter approach to identify wetlands. The three parameters needed to assign a site as a wetland include evidence of wetland hydrology, hydrophytic vegetation, and hydric soils. However, problem areas may periodically or permanently lack certain indicators due to seasonal or annual variability or the nature of the soils or plant species on site. Atypical wetlands lack certain indicators due to recent human activities or natural events. Guidance for determining the presence of wetlands in these situations is presented in the Regional Supplement.

2.3.2 RWQCB Waters of the State

Psomas determined the limits of RWQCB jurisdiction in the field following the methods described for USACE jurisdiction, above.[6] The RWQCB shares USACE jurisdiction unless isolated conditions are present or waters are ephemeral. If isolated or ephemeral waters are present, the RWQCB takes jurisdiction using the USACE's definition of the OHWM. The SWRCB defines wetlands as areas that include (1) continuous or recurrent saturation of the upper substrate of sufficient duration to cause anaerobic conditions and (2) vegetation dominated by hydrophytes or lacking vegetation (SWRCB 2019).

[6] RWQCB limits of jurisdiction are normally determined by the presence of the OHWM per USACE methods for the arid southwest. The limits of RWQCB jurisdiction are not affected by the September 8, 2023, Amended 2023 Rule published by the USEPA and USACE (USACE 2023b).

2.3.3 CDFW Waters

CDFW's jurisdiction was determined by measuring the distance from the top of one bank to the top of the opposite bank for the water features; if riparian vegetation is present, jurisdiction is extended to the outer limit of riparian vegetation located along the feature. CDFW jurisdiction within Irvine Lake generally extended to the 795.9-foot elevation contour around the lake, which is the current maximum elevation of the lake with the flashboards installed.

3.0 RESULTS

Seventeen potential jurisdictional features were mapped in the survey area: Irvine Lake, Santiago Creek, and 15 smaller drainages that discharge into Irvine Lake or Santiago Creek (referred to as Drainage 1, Drainage 2, et seq.) (Exhibits 7, 8, and 9; detailed mapping for USACE, RWQCB and CDFW is provided in Attachment D). Results of the literature review are provided in Section 3.1, and a detailed analysis of each regulatory agency's jurisdiction is provided in Section 3.2. Attachment E provides datasheets that summarize the overall condition of the individual wetlands, drainages, and indicators of OHWM.

3.1 LITERATURE REVIEW

USGS Topographic Quadrangle. Topography in the survey area consists of relatively steep slopes around Irvine Lake with Santiago Creek encompassing a relatively broad floodplain both above and below the dam. Elevations range from approximately 657 to 996 feet above mean sea level (msl) in the survey area. Santiago Creek Dam is labeled on the USGS quadrangle map with Santiago Creek, a named blueline stream, and Irvine Lake (labeled as Santiago Reservoir on the quadrangle map) encompassing the majority of the survey area. One, unnamed blueline stream enters the survey area from the western edge north of the dam, and nine unnamed blueline streams enter Irvine Lake from the surrounding slopes.

Color Aerial Photography. Santiago Creek Dam, including the spillway; Irvine Lake; Santiago Creek; and multiple smaller drainages are clearly visible on aerial imagery. Fluctuations in the lake level are visible across historic aerials. Upstream of Irvine Lake, Santiago Creek encompasses a relatively broad floodplain that appears to contain dense, riparian vegetation. Below the spillway, Santiago Creek is confined to a narrow channel. The channel then broadens, and sparse vegetation is visible. Drainage 3 appears lined with concrete and riprap on the aerial imagery. The remaining drainages appear to contain varying degrees of associated riparian vegetation.

U.S. Department of Agriculture, Natural Resources Conservation Service. The survey area occurs in the following soil survey area: Orange County and Part of Riverside County, California. Within this survey area, the USDA NRCS has delineated the boundaries of "soil map units", which often contain components of multiple soil types that may be classified as hydric or non-hydric. The National Hydric Soils List identifies a soil map unit as "hydric" if it contains either a major or minor component that is at least in part hydric.

Soils mapped in the survey area include Alo variant clay, Anaheim loam, Anaheim clay loam, Balcom-rock outcrop complex, beaches, Bosank clay, Botella loam, Botella clay loam, Calleguas clay loam, Capistrano sandy loam, Cieneba sandy loam, Cieneba–rock outcrop complex, Corralitos loamy sand, Myford sandy loam, pits, riverwash, rock outcrop–Cieneba complex, Soboba gravelly loamy sand, Soper loam, Soper gravelly loam, Soper cobbly loam, Soper–rock outcrop complex, Sorrento loam, water, and dam (Exhibit 5). Of these soils, beaches, Corralitos loamy sand, pits, riverwash, and Soboba gravelly loamy sand (0 to 5 percent slopes) are considered hydric (USDA NRCS 2020). These soils are primarily found along Santiago Creek and the other main drainage entering Irvine Lake from the south. A description of the soils mapped in the survey area is provided in Attachment F of this report.

U.S. Fish and Wildlife Service, National Wetlands Inventory. The NWI mapped various features in the survey area, including Irvine Lake, the spillway, Santiago Creek, Drainage 1, and Drainages 3 through 15 (Table 2; Exhibit 6). Various features are considered Lacustrine (i.e., lakes), Riverine (i.e., channelized areas like rivers and streams), and Palustrine (i.e., areas generally dominated by trees, shrubs, and emergent vegetation, but also including ponds). Additional areas mapped by the NWI did not exhibit bed, bank, or OHWM indicators during the field visit and were not considered jurisdictional waters. Irvine Lake and the downstream ends of Santiago Creek, Drainage 12, and Drainage 15 where they discharge into Irvine Lake were mapped as Lacustrine features. The main channel of Santiago Creek and Drainage 12 were mapped as Riverine with surrounding areas mapped as Palustrine. The upstream end of Drainage 15 was mapped as Palustrine. The spillway and smaller drainages were mapped as Riverine. The description for NWI mapped wetland resources is provided in Attachment B of this report.

TABLE 2
MAPPED NATIONAL WETLANDS INVENTORY RESOURCES

Feature	National Wetlands Inventory Classification(s)[1]
Irvine Lake	L1UBHh, L2ABFh, L2UBFh, L2USAh, PFOCh

Drainage 15	PFO/EM1Ch, L2ABFh, L2UBFh

[1] Descriptions of NWI classifications are provided in Attachment B.

The NWI data was used to provide additional guidance on planning the field surveys. Given that wetland features mapped for the NWI may or may not exist at present because of changing conditions and development, this resource provides preliminary data and historic data. These features were ground-truthed in the field during the delineation.

Regional Water Quality Control Plans. The Basin Plan discusses Santiago Creek (Reach 1 occurs downstream of Irvine Lake) and Irvine Lake. According to the Basin Plan, the water quality objective for Reach 1 of Santiago Creek is 600 milligrams per liter (mg/l) of total dissolved solids. Water quality objectives for Irvine Lake are shown in Table 3.

TABLE 3
WATER QUALITY OBJECTIVES FOR IRVINE LAKE

Water Quality Objectives (mg/l)					
Total Dissolved Solids	**Hardness**	**Sodium**	**Chloride**	**Total Inorganic Nitrogen**	**Sulfate**
730	360	110	130	6	310
mg/l: milligrams per liter					

Beneficial uses are defined in the Porter-Cologne Act as those uses of water that are necessary for tangible and intangible economic, social, and environmental benefits. Beneficial uses for Reach 1 of Santiago Creek include Municipal and Domestic Water Supply (MUN) waters, Groundwater Recharge (GRW) waters, Water Contact Recreation (REC-1) waters, Non-contact Water Recreation (REC-2) waters, Warm Fresh Water Habitat (WARM) waters, and Wildlife Habitat (WILD) waters. Beneficial uses for Irvine Lake include MUN waters, Agricultural Supply (AGR) waters, REC-1 waters, REC-2 waters, WARM waters, Cold Freshwater Habitat (COLD) waters, and WILD waters. Descriptions of the beneficial uses applicable to waters in the survey area are provided in Attachment G of this report.

3.2 JURISDICTIONAL ANALYSIS

Table 4 summarizes the type and extent of the jurisdictional features delineated in the survey area.

TABLE 4
SUMMARY OF JURISDICTIONAL RESOURCES IN THE SURVEY AREA

3.2.1 Waters of the United States Determination

Connectivity to a Traditional Navigable Water

Santiago Creek is a tributary of the Santa Ana River, which discharges into the Pacific Ocean (a TNW) approximately 23 river miles downstream from Santiago Creek Dam. Tributaries to TNWs that meet the relatively permanent standard, are also WOTUS. Data from the NWI and USGS stream gauge data were used to assist in the determination of whether Santiago Creek is relatively permanent water. According to the NWI, the central channel of Santiago Creek above the dam was classified as R2UBF, which has a semi-permanent flooding water regime. Stream gauge data was not available downstream or immediately upstream of Santiago Creek Dam, but a station was located at Modjeska Canyon. Average monthly discharge for January, February, and March (as recorded between 1961 and February 2020) was 15, 30, and 18 cubic feet per second (cfs), while discharge was less than 6 cfs for the remaining months (USGS 2020a), indicating increased flow for three months of the year (i.e.,

seasonally). The main channel of Santiago Creek below the dam is classified as R4SBC, which indicates that it is seasonally flooded (i.e., surface water is present for extended periods of time, see Attachment B). In addition, on-site observations indicate that Santiago Creek should be considered an intermittent stream. The area below the spillway had patches of obligate wetland plants (e.g., cattails [*Typha* sp.]), indicating that water is present for extended periods of time. Surface water was observed in portions of the creek both above and below the dam during various survey visits. For these reasons, Santiago Creek can be considered to meet the relatively permanent standard; thus, it is a WOTUS.

Irvine Lake is an impoundment of Santiago Creek, which has its headwaters in the Santa Ana Mountains. Impoundments of jurisdictional waters are WOTUS; therefore, Irvine Lake would be considered WOTUS.

Drainage 1, as shown on Exhibit 7, carries flow from the west side of Santiago Creek via a pipe culvert under an access road adjacent to an Arizona crossing. As an underground offshoot of Santiago Creek, this drainage would also be considered to have relatively permanent flow; thus, it is a WOTUS.

Drainage 2, as shown on Exhibit 7, is an outlet from Irvine Lake used to release lake water to the creek (IRWD 2020b). Additionally, IRWD conducts valve tests twice per year that release water into the channel. Given that release of flow in this drainage is limited, this drainage is considered to be ephemeral; thus, it is not a WOTUS.

Drainage 3, as shown on Exhibit 7, appears to drain flow from the hills west of the survey area and overflows from basins located along its length. The NWI classifies this drainage as R4SBAr, which indicates that it is temporarily flooded (Appendix B). During the March site visit, which occurred immediately following a rain event, surface water was not observed in this drainage. Therefore, it is considered to carry ephemeral flow and is not considered a WOTUS.

Drainages 4, 8, 9, 10, 11, and 13, as shown on Exhibit 7, drain flow from the hills surrounding Santiago Creek and Irvine Lake and are classified by the NWI as R4SBA, which indicates that they are temporarily flooded (Appendix B) With the exception of a small inundated area at the downstream end of Drainage 9, these areas were dry during the October site visits. Therefore, these drainages are considered to carry ephemeral flow and are not WOTUS.

Drainages 5, 6, 7, and 14, as shown on Exhibit 7, are classified by the NWI as R4SBC, which indicates that they are seasonally flooded (Appendix B) These areas were all dry at the time of the October site visits and historic aerial imagery does not show surface water in these areas. The streambeds are similar in appearance to Drainages 4, 8, 9, 10, 11, and 13, with sandy sediment in the channel and no hydrophytic vegetation present. Therefore, it is likely that these drainages only experience ephemeral flow; therefore, they are not WOTUS.

The low flow channels of Drainage 12 are classified as R4SBC, as shown on Exhibit 7, and are surrounded by PSSA, which indicates that the main drainage has a water regime considered to be seasonally flooded (Appendix B). Drainage 15, is classified as PFO/EM1Ch, as shown on Exhibit 7, which indicates that it has a water regime also considered to be seasonally flooded (Appendix B). These areas were all dry at the time of the October site visits. Historic

aerial imagery does not show surface water in these areas except at the downstream ends of Drainages 12 and 15 during periods of high reservoir levels and in April 2005 in Drainage 12. The low flow channels lack hydrophytic vegetation that would indicate regular flow, in contrast to Santiago Creek which has water cress (*Nasturtium officinale*), an obligate wetland species, along portions of its length. Therefore, while the NWI indicates that these areas may be seasonally flooded, field observations suggest that they are ephemeral; therefore, they are not WOTUS.

Limits of Waters of the United States

As discussed above, Irvine Lake, Santiago Creek, and Drainage 1 would be considered WOTUS. The limits of WOTUS were based on indicators of OHWM.

Jurisdictional limits for Irvine Lake were identified as the median reservoir level (762.2 above msl) and OHWM was confirmed during the October 2020 field visits. Indicators of OHWM include a defined water mark on the existing dam embankment, a change in vegetation species and cover around the reservoir, and a line of depositional material in unvegetated areas around the reservoir.

An Arid West Ephemeral and Intermittent Streams OHWM Datasheet was completed for a representative area in Santiago Creek showing evidence of an OHWM to determine extent of WOTUS (see Attachment E). Evidence of OHWM observed in the survey area included the presence of bed and bank, benches, drift deposits, sediment deposits, a change in average sediment texture, a change in vegetation species and cover, and a break in bank slope. Low terraces within the active floodplain of Santiago Creek were excluded from WOTUS jurisdiction. These areas were at a higher elevation and contained upland species, such as California buckwheat (*Eriogonum fasciculatum*). The OHWM in Santiago Creek was directly observed from Irvine Lake to approximately 300 feet upstream of the confluence with Drainage 7. Upstream of this area, dense riparian vegetation impeded access and the OHWM extent was not directly observed. Historic aerial imagery over multiple years was used to map the OHWM extent in Santiago Creek upstream of this point.

The OHWM indicators for Drainage 1 included the presence of bed and bank, a change in average sediment texture, and a change in vegetation cover.

Based on an assessment of jurisdictional waters, a total of 428.476 acres of WOTUS under the regulatory authority of the USACE occurs in the survey area (Table 4; Exhibit 7).

Wetlands Determination

Irvine Lake, Santiago Creek, and Drainage 1 are WOTUS and may be considered wetland or non-wetland.

Irvine Lake has water levels that change based on inflow, precipitation, and releases from the dam. At the time of the survey visit, the exposed lakebed included both vegetated and unvegetated areas. Vegetated areas within the OHWM were dominated by: (1) a variable cover of swamp prickle grass (*Crypsis schoenoides*, facultative wetland) close to the lake bottom; (2) a variable cover of cocklebur (*Xanthium strumarium*; facultative) primarily along

the edge of the OHWM, and (3) cocklebur with scattered Goodding's black willow (*Salix gooddingii*; facultative wetland). These areas would all be considered dominated by hydrophytic vegetation. A series of three sampling points (Sampling Points 3, 4, and 5 on Exhibit 7; Attachment E) were assessed along the western edge of the lake, two were below the mapped OHWM and one was just above the OHWM. Indicators of hydrophytic vegetation, hydric soils, and wetland hydrology were observed at the two sampling points below the OHWM; hydric soils were not observed above the OHWM. Given the lack of hydric soil indicators, areas above the OHWM were not considered wetland WOTUS. Areas along the shoreline below the OHWM that are dominated by hydrophytic vegetation are considered wetland WOTUS because they meet all three wetland criteria. Unvegetated areas below the OHWM represent a "problematic wetland situation" according to USACE (2008) guidelines and can be considered wetland WOTUS meeting two of the three wetland criteria (i.e., hydrology and soils) because temporal shifts in vegetation would meet the third wetland criteria periodically. During the site visit, it was observed that the lakebed within the OHWM had various stages of growth of swamp prickle grass, with young individuals in areas that were recently inundated and mature individuals growing in areas that were not as recently inundated. As vegetation fluctuates with the lake levels, the currently unvegetated areas are expected to contain hydrophytic vegetation periodically. Therefore, the unvegetated shoreline below the OHWM is also considered wetland WOTUS.

Wetland hydrology indicators (e.g., surface water, drift deposits, inundation visible on aerial imagery) are present along the length of Santiago Creek upstream of Irvine Lake. Immediately upstream of Irvine Lake, Santiago Creek is confined to a narrow channel with vertical banks. The area within the OHWM is sparsely vegetated and has a sandy substrate. Vegetation increases in density farther upstream. These upstream areas have a canopy dominated by hydrophytic vegetation, consisting primarily of Goodding's black willow, western sycamore (*Platanus racemosa*; facultative), and mule fat (*Baccharis salicifolia* ssp. *salicifolia*; facultative); water cress (*Nasturtium officinale*; obligate wetland) is scattered along the waterline. The soils are sandy with rock and cobbles present in the channel. Riparian areas represent a problematic vegetation situation. The USACE (2008) recommends that where hydric soils and/or hydrology are problematic, "emphasis should be placed on the understory, which may be more indicative of current wetland or non-wetland conditions". Therefore, the upstream portions of the channel exhibiting obligate wetland species in the understory (i.e., water cress) were mapped as wetland WOTUS. However, it should be noted that portions of the creek were inaccessible due to thick vegetation and could not be delineated in the field; therefore, these areas were mapped using aerial photographs and the designation as a wetland WOTUS is assumed. Given the sparse vegetation in the downstream portions of the channel, these areas are not considered wetland WOTUS.

A sampling point was assessed in a portion of Santiago Creek north of the dam that contained obligate wetland vegetation and adjacent surface water (Sampling Point 1 on Exhibit 7; Attachment E). Indicators of hydrophytic vegetation and wetland hydrology were present, but hydric soils were not present. Therefore, this area was not considered to be a wetland. The remaining portions of Santiago Creek and Drainage 1 had fewer indicators of wetland hydrology; vegetation was sparse and primarily consisted of facultative species (e.g., mule fat) and facultative upland or upland species (e.g., scalebroom [*Lepidospartum squamatum*]

and fennel [*Foeniculum vulgare*]). Therefore, these areas were not considered wetland WOTUS.

Based on an assessment of jurisdictional waters, a total of 101.706 acres of wetland WOTUS under the regulatory authority of the USACE occurs in the survey area (Table 4; Exhibit 7).

3.2.2 Regional Water Quality Control Board Jurisdiction

The RWQCB asserts jurisdiction over all WOTUS so that the extent of RWQCB "waters of the State" matches the USACE's jurisdiction. Therefore, all features with USACE jurisdiction (i.e., Irvine Lake, Santiago Creek, and Drainage 1) are also subject to the jurisdiction of the RWQCB. The Porter-Cologne Act provides the State with the authority to regulate waters of the State that are not under USACE jurisdiction (i.e., isolated or ephemeral waters). This provision allows Drainages 2 through 15 to be considered waters of the State.

Limits of Waters of the State

The limits of waters of the State for Santiago Creek, Irvine Lake, and Drainage 1 are the same as for USACE. Drainages 2, 3, 6, 7, 10, 11, and 13 have indicators of an OHWM for their entire extent. This includes a break in bank slope, change in sediment texture, change in vegetation type and cover, and the presence of sediment and drift deposits at or below the OHWM. However, Drainages, 4, 5, 8, 9, 12, 14, and 15 only exhibit indicators of OHWM at their upstream ends. Drainages 4 and 5 are channelized until they reach a broad, relatively flat area above the median lake level. At this point, it appears that water sheet flows across the area and indicators of OHWM are lacking. Drainage 8 is channelized until it reaches the edge of riparian vegetation along Santiago Creek. At that point, the drainage broadens and is not confined to a channel. Drainage 9 ends at a slightly depressional area at the edge of an access road. There are no indicators of OHWM beyond this point. While the upstream ends of Drainages 12 and 15 are channelized, the downstream ends do not appear to have a defined bed, bank, or channel. The drainages are also disrupted by the presence of above-grade access roads. Water appears to sheet flow across the area and many potential indicators of OHWM are lacking (e.g., leaf litter is dense under the riparian canopy of Drainage 12 and has not been washed away, there is no hydrophytic herbaceous vegetation in Drainage 12, vegetation in Drainage 15 is predominantly facultative, and there is no evidence of scour). In addition, while periodic inundation of these areas occurs during high reservoir levels, the elevation is above the median reservoir level. Like Drainage 8, Drainage 14 is channelized until it reaches the edge of the riparian canopy surrounding Drainage 12. Therefore, only the upstream, channelized portions of Drainages 4, 5, 8, 9, 12, 14, and 15 are considered to have an OHWM and would be considered waters of the State.

Based on an assessment of jurisdictional waters, a total of 435.205 acres of non-wetland waters of the State under the regulatory authority of the RWQCB occur in the survey area (Table 4; Exhibit 8).

Wetlands Determination

Sampling Point 2 (Exhibit 8; Attachment D) was assessed at the downstream end of Drainage 9 in order to determine if it was an isolated or adjacent wetland. This area contained surface water and hydrophytic vegetation (primarily tall flatsedge [*Cyperus* cf. *eragrostis*; facultative wetland]). This area did not have indicators of hydric soil and would not be considered an isolated or adjacent wetland.

The remaining drainages (Drainages 2 through 15) were dominated by facultative, facultative upland, upland vegetation or were unvegetated, and so did not meet the hydrophytic vegetation criterion for wetlands.

Therefore, wetland waters of the State are the same as those under USACE regulatory authority. Based on an assessment of jurisdictional waters, a total of 101.706 acres of wetland waters of the State under the authority of the RWQCB occur in the survey area (Table 4; Exhibit 8).

3.2.3 California Department of Fish and Wildlife Jurisdiction

The top of the existing spillway with the flashboards installed, which is at an elevation of approximately 795.9 feet above msl, is generally considered the top of bank for Irvine Lake. This limit of CDFW jurisdiction was confirmed during the field visit and corresponded to a break in slope and/or the upper extent of riparian vegetation around the edge of the reservoir. The spillway is also included as part of Irvine Lake/Santiago Creek. The 795.9-foot elevation contour extends up Santiago Creek and various drainages in the survey area; however, on-site conditions do not support extending CDFW jurisdiction to that elevation for all these features. Santiago Creek is confined to steep, almost vertical banks where it discharges into Irvine Lake; in this case, CDFW jurisdiction was limited to the area between those banks instead of the 795.9-foot elevation contour. Similarly, CDFW extent was mapped along the outer edge of riparian vegetation where Drainage 12 discharges into Irvine Lake. The existing parking lot and ornamental planting areas where Drainage 12 discharges into Irvine Lake were also excluded from CDFW jurisdiction.

Santiago Creek and Drainages 1 through 15 have defined beds and banks over most of their length; a riparian canopy occurs along portions of these drainages. These features would be under the regulatory authority of the CDFW.

Based on an assessment of jurisdictional waters, a total of 669.630 acres of waters under the regulatory authority of the CDFW occur in the survey area (Table 4; Exhibit 9).

4.0 IMPACT ANALYSIS

Project impacts include permanent structural impacts in the vicinity of the dam and spillway. Temporary impacts include construction access, staging areas, etc. that will occur during construction activities. It should be noted that Irvine Lake will be partially or completely dewatered prior to construction of the access road on the lake bottom. A portion of the lake bottom would be used as a borrow site. The proposed Project would consist of structural improvements to the dam and spillway, replacement of the outlet tower, and raising the spillway by six feet to the 797.9-foot elevation. Jurisdictional resources that would be permanently or temporarily impacted by the Project include Irvine Lake, Santiago Creek, Drainage 1, Drainage 2, and Drainage 3.

The proposed Project also includes increasing the spillway height two feet above the current maximum water level (with flashboards installed) to 797.9 feet. This would lead to infrequent inundation of the area between the 795.9-foot elevation contour and the 797.9-foot elevation around the perimeter of Irvine Lake (referred to as "additional inundation area") for an approximate maximum up to 45 days, but typically would be inundated for less time, and in some years not at all. In the last 20 years, Irvine Lake has been four times at the maximum capacity with the flashboards installed of 795.9-foot elevation. Approximately the same frequency would be expected following implementation of the proposed Project, depending on the frequency of future large storms and depending on the operations of the lake. With this frequency and duration of inundation, the vegetation within the "additional inundation area" is not expected to type convert. While the OHWM may change following the implementation of the proposed Project, creating some additional jurisdiction, riparian vegetation and hydric soils are not expected to be created where they do not currently occur based on the infrequent additional inundation. Portions of some mapped drainages fall within the additional inundation area (i.e., Irvine Lake, Santiago Creek, Drainage 4–7, Drainage 9, Drainage 12, and Drainage 15).

Based on the preliminary Project design, a total of 203.570 acres of WOTUS under the regulatory authority of the USACE would be impacted by the proposed Project (wetland: 0.000 acre permanent, 63.915 acres temporary; non-wetland: 1.798 acres permanent, 137.857 acres temporary) (Tables 5 and 8; Exhibit 10). This represents impacts to WOTUS in Irvine Lake, Santiago Creek, and Drainage 1. The proposed Project would inundate an additional 0.673 acre of wetland WOTUS within the additional inundation area (Table 5; Exhibit 10). As mentioned above, the inundation of these areas would be infrequent and limited in duration. Additionally, these areas are already within the OHWM; additional inundation of areas under the jurisdiction of USACE would not be considered a substantial change.

Based on the preliminary Project design, a total of 203.641 acres of waters of the State under the regulatory authority of the RWQCB would be impacted by the proposed Project (wetland: 0.000 acre permanent, 63.915 acres temporary; non-wetland 1.861 acres permanent, 137.865 acres temporary) (Table 6 and 8; Exhibit 11). This represents impacts to waters of the State in Irvine Lake, Santiago Creek, Drainage 1, Drainage 2, and Drainage 3. The proposed Project would impact an additional 0.711 acre of waters of the State (0.673 acre wetland, 0.038 acre non-wetland) with the additional inundation area (Table 6; Exhibit 11).

As mentioned above, the inundation of these areas would be infrequent and limited in duration. Additionally, these areas are already within the OHWM, subject to existing water flow, and/or are riparian in nature; additional inundation of areas under the jurisdiction of RWQCB would not be considered a substantial change.

Based on the preliminary Project design, a total of 233.774 acres of waters under the regulatory authority of the CDFW would be impacted by the proposed Project (3.924 acres permanent; 229.850 acres temporary (Tables 7 and 8; Exhibit 12). This represents impacts to waters under the authority of the CDFW in Irvine Lake, Santiago Creek, Drainage 1, Drainage 2, and Drainage 3. The proposed Project would impact an additional 8.980 acres of waters under the authority of the CDFW with the additional inundation area (Table 7; Exhibit 12). As mentioned above, the inundation of these areas would be infrequent and limited in duration. Additionally, these areas are already within the existing bed and bank, subject to existing water flow, and/or are riparian in nature; additional inundation of areas under the jurisdiction of CDFW would not be considered a substantial change.

5.0 REGULATORY APPROVAL PROCESS

5.1 REGULATORY PERMIT REQUIREMENTS

This section summarizes the various permits, agreements, and certifications that may be required prior to initiation of project activities that involve impacts to jurisdictional waters.

- USACE Section 404 Individual Permit
- RWQCB Waste Discharge Requirements
- CDFW Section 1602 Lake or Streambed Alteration Agreement

It should be noted that all regulatory permit applications can be processed concurrently. The USACE permit would be issued subject to the receipt of the RWQCB's Waste Discharge Requirements (WDRs).

5.1.1 U.S. Army Corps of Engineers

Prior to construction in WOTUS, a Section 404 permit from the USACE is required for impacts to WOTUS (i.e., Irvine Lake and Santiago Creek). Regulatory authorization in the form of a Nationwide Permit (NWP) or regional permit is provided for certain categories of activities. If the NWP conditions cannot be met, an Individual Permit (IP) will be required. It is expected that the Project would require an IP. It should be noted that the definition of WOTUS is currently in flux, and the USACE will make the final determination of jurisdictional boundaries during the permit consultation process.

Issuance of the USACE Section 404 permit would be contingent upon the approval of a permit from the Santa Ana RWQCB. The RWQCB requires certification of the project's California Environmental Quality Act (CEQA) documentation before it will approve the WDRs. The RWQCB, as a responsible agency, will use the project's CEQA document to satisfy its own CEQA compliance requirements.

On August 11, 2023, staff from IRWD, SWD, Psomas, USACE, USEPA, and U.S. Fish and Wildlife Service (USFWS) attended an online pre-application filing meeting. IRWD described the proposed Project and Psomas discussed biological surveys conducted and resources that are present in the BSA. The meeting discussed that the Project would need an Individual Permit from the USACE and a formal Section 7 Consultation with the USFWS. The purpose of this meeting was to provide the attending agencies with a briefing on the project's scope and potential resource issues in advance of filing the 404 permit application.

5.1.2 Regional Water Quality Control Board

When a project involves impacts to both federal WOTUS and non-federal waters of the State, the RWQCB would authorize all impacts under Waste Discharge Requirements (WDRs). The application for discharges of dredged or fill material would include both WOTUS and ephemeral waters of the State.

The RWQCB requires the Applicant to address urban storm water runoff during and after construction in the form of Best Management Practices (BMPs). These BMPs are intended to address the treatment of pollutants carried by storm water runoff and are required in all complete applications. The WDRs must also address compliance with the Basin Plan. The application would also require the payment of an application fee, which would be based on project impacts.

Staff from IRWD, Psomas, CDFW, RWQCB, and U.S. Fish and Wildlife (USFWS) attended a pre-application field meeting for the Project on July 12, 2023. During the field meeting, IRWD described the proposed Project and Psomas discussed biological surveys conducted and resources that are present in the BSA. The meeting attendees visited the dam crest, spillway and also the staging area at the upstream end of Irvine Lake.

On August 16, 2023, the RWQCB hosted the required pre-filing meeting. This meeting is required to be conducted at least 30 days prior to the filing of a 401 water quality certification request with the RWQCB and the USACE.

5.1.3 California Department of Fish and Wildlife

Prior to construction, a Notification of Lake or Streambed Alteration (LSA) must be submitted to the CDFW that describes any proposed streambed alteration contemplated by a project. If an LSA Agreement is required, the CDFW may want to conduct an on-site inspection.

In addition to the formal application materials and the fee, a copy of the appropriate environmental document should be included in the submittal, consistent with CEQA requirements. The CDFW will not deem the application to be complete until the application fees have been paid and the agency is provided with a certified CEQA document and a signed copy of the receipt of County Clerk filing fees for the Notice of Determination.

Staff from IRWD, Psomas, CDFW, RWQCB, and USFWS attended a pre-application field meeting for the Project on July 12, 2023. During the field meeting, IRWD described the proposed Project and Psomas discussed biological surveys conducted and resources that are present in the BSA. The meeting attendees visited the dam crest, spillway and also the staging area at the upstream end of Irvine Lake.

6.0 RECOMMENDATIONS

Based on the conclusions of this Jurisdictional Delineation Report, the following recommendations have been identified:

1. The appropriate permits, agreements, and certifications, as discussed in Section 5, should be prepared and submitted for projects impacting jurisdictional waters. Avoidance, minimization, and/or mitigation measures may be required by the regulatory agencies.

7.0 DISCLAIMER STATEMENT

This report represents Psomas' summary of the jurisdictional resources delineated in the survey area. The descriptions and maps provided are Psomas' jurisdictional recommendation based on the field evidence, regulations, and environmental information available. Only the regulatory agencies can make the final determination on whether the features present are subject to USACE, RWQCB, and/or CDFW regulatory authority.

ATTACHMENT A

SUMMARY OF REGULATORY AUTHORITY

REGULATORY AUTHORITY

This attachment summarizes the regulatory authority of the U.S. Army Corps of Engineers (USACE), the Regional Water Quality Control Board (RWQCB), and the California Department of Fish and Wildlife (CDFW) over activities that have potential to impact jurisdictional resources.

U.S. Army Corps of Engineers

The USACE Regulatory Branch regulates activities that discharge dredged or fill materials into waters of the United States (WOTUS) under Section 404 of the Federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. This permitting authority applies to all WOTUS where the material (1) replaces any portion of WOTUS with dry land or (2) changes the bottom elevation of any portion of any WOTUS. These fill materials would include sand, rock, clay, construction debris, wood chips, and materials used to create any structure or infrastructure in these waters.

Waters of the United States

The definition of WOTUS has been subject to shifting regulations over the years, with the U.S. Supreme Court issuing multiple decisions that provide context and guidance in determining the appropriate scope of WOTUS. The following provides a brief summary of the historical interpretations of WOTUS.

In *United States v. Riverside Bayview Homes*,[1] the Court upheld the inclusion of adjacent wetlands in the regulatory definition of WOTUS. In *Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers* (SWANCC),[2] the Court held that the use of "isolated" non-navigable intrastate ponds by migratory birds was not, by itself, sufficient basis for the exercise of federal regulatory authority under the CWA. In *Rapanos v. United States* (Rapanos),[3] a majority of the U.S. Supreme Court overturned two Sixth Circuit Court of Appeals decisions, finding that certain wetlands constituted WOTUS under the CWA. In his plurality opinion, Justice Scalia argued that WOTUS should not include channels through which water flows intermittently or ephemerally or channels that periodically provide drainage for rainfall. He also stated that a wetland may not be considered "adjacent to" remote WOTUS based on a mere hydrologic connection. Justice Kennedy authored a separate concurring opinion concluding that wetlands are WOTUS if they, either alone or in combination with similarly situated lands in the region, significantly affect the chemical, physical, and biological integrity of other covered waters more readily understood as "navigable". Lacking a majority opinion, regulatory jurisdiction under the CWA exists over a water body if either the plurality's or Justice Kennedy's "significant nexus" standard is satisfied.

1 *United States v. Riverside Bayview Homes, Inc*., 474 U.S. 121 (1985)
2 *Solid Waste Agency of Northern Cook Cty. v. Army Corps of Engineers,* 531 U.S. 159 (2001)
3 Consolidated cases: *Rapanos v. United States* and *Carabell v. United States* (126 S. Ct. 2208 2006) refer to the U.S. Supreme Court's decision concerning USACE jurisdiction over waters of the United States under the CWA.

In 2015, the USACE and the U.S. Environmental Protection Agency (USEPA) published a final rule (2015 Rule) clarifying the scope of WOTUS protected under the CWA. One of the major changes was to make all tributaries and adjacent waters jurisdictional, by rule.

In December 2018, the USEPA and the Department of the Army (DOA) proposed a new definition of WOTUS that clarified federal authority under the federal CWA consistent with the February 2017 Presidential Executive Order entitled "Restoring the Rule of Law, Federalism, and Economic Growth by Reviewing the 'Waters of the United States' Rule". On September 12, 2019, the USEPA and DOA signed a final "Step One Rule" to repeal the 2015 Rule and re-codify the regulatory text defining WOTUS that existed prior to the 2015 Rule. The new regulations went into effect on December 23, 2019.[4] With this new final rule, the regulations defining the scope of federal CWA jurisdiction are those portions of the Code of Federal Regulations (CFR) as they existed before the amendments promulgated in the 2015 rule.

The Step One Rule was replaced by the Navigable Waters Protection Rule (NWPR, Step Two Rule). On January 23, 2020, the USEPA and DOA finalized the Step Two Rule defining WOTUS. This rule was published in the *Federal Register* on April 21, 2020, and went into effect 60 days following publication (i.e., on June 22, 2020). The NWPR changed the definition of WOTUS. Major changes implemented by this rule were that ephemeral features would not be considered jurisdictional, the "significant nexus" process was eliminated, and wetlands must either abut jurisdictional waters of have a direct hydrological surface connection to jurisdictional waters.

On June 9, 2021, the USEPA and DOA announced their intent to revise the definition of WOTUS to better protect our nation's vital water resources that support public health, environmental protection, agricultural activity, and economic growth. On August 30, 2021, the U.S. District Court for the District of Arizona vacated and remanded the NWPR for reconsideration to the USEPA and the USACE.[5] In light of this order, the agencies halted implementation of the NWPR and interpreted WOTUS consistent with the pre-2015 regulatory regime.

On January 18, 2023, the USEPA and the USACE published in the *Federal Register* a new Water Rule (2023 Rule) which provided an updated definition of WOTUS (USACE 2023a). This 2023 Rule became effective on March 20, 2023. The 2023 Rule used the pre-2015 regulations as the basis for the definition of WOTUS, while incorporating the Supreme Court's ruling from the case of *Rapanos v. United States* ("Rapanos" 2006)[6]. The 2023 Water Rule defined WOTUS per the following categories:

1. Waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; the territorial seas; or interstate waters, including interstate wetlands ("paragraph (a)(1) waters");

[4] 40 CFR 230.3(s).

[5] *Pasqua Yaqui Tribe, et al. v. U.S. Environmental Protection Agency, et al*.

[6] Consolidated cases: *Rapanos v. United States* and *Carabell v. United States* refer to the U.S. Supreme Court's decision concerning USACE jurisdiction over "waters of the U.S." under the CWA.

2. Impoundments of waters otherwise defined as WOTUS under this definition, other than impoundments of waters identified under paragraph (a)(5) of this section ("paragraph (a)(2) waters");
3. Tributaries of waters identified in paragraph (a)(1) or (2) of this section: that are relatively permanent, standing, or continuously flowing bodies of water; or that either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of waters identified in paragraph (a)(1) of this section ("paragraph (a)(3) waters");
4. Wetlands adjacent to the following waters: waters identified in paragraph (a)(1) of this section; or relatively permanent, standing or continuously flowing bodies of water identified in paragraph (a)(2) or (a)(3)(i) of this section and with a continuous surface connection to those waters; or waters identified in paragraph (a)(2) or (3) of this section when the wetlands either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of waters identified in paragraph (a)(1) of this section ("paragraph (a)(4) waters");
5. Intrastate lakes and ponds, streams, or wetlands not identified in paragraphs (a)(1) through (4) of this section that are relatively permanent, standing or continuously flowing bodies of water with a continuous surface connection to the waters identified in paragraph (a)(1) or (a)(3)(i) of this section; or that either alone or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of waters identified in paragraph (a)(1) of this section ("paragraph (a)(5) waters").

The 2023 Rule also excluded certain waters from being WOTUS:

1. Waste treatment systems, including treatment ponds or lagoons, designed to meet the requirements of the CWA;
2. Prior converted cropland designated by the Secretary of Agriculture. The exclusion would cease upon a change of use, which means that the area is no longer available for the production of agricultural commodities. Notwithstanding the determination of an area's status as prior converted cropland by any other Federal Agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with the USEPA;
3. Ditches (including roadside ditches) excavated wholly in and draining only dry land and that do not carry a relatively permanent flow of water;
4. Artificially irrigated areas that would revert to dry land if the irrigation ceased;
5. Artificial lakes or ponds created by excavating or diking dry land to collect and retain water and which are used exclusively for such purposes as stock watering, irrigation, settling basins, or rice growing;
6. Artificial reflecting or swimming pools or other small ornamental bodies of water created by excavating or diking dry land to retain water for primarily aesthetic reasons;
7. Waterfilled depressions created in dry land incidental to construction activity and pits excavated in dry land for the purpose of obtaining fill, sand, or gravel unless and

until the construction or excavation operation is abandoned and the resulting body of water meets the definition of WOTUS; and

8. Swales and erosional features (e.g., gullies, small washes) characterized by low volume, infrequent, or short duration flow.

In response to the May 25, 2023, Supreme Court decision in the case of *Sackett v. USEPA*, the USEPA issued a pre-published rule regarding the definition of WOTUS on August 29, 2023 (USACE 2023b). On September 8, 2023, the USEPA and the DOA amended the CFR to conform the definition of WOTUS to the Supreme Court decision. This conforming rule amends the provisions of the agencies' definition of WOTUS that are invalid under the Supreme Court's interpretation of the CWA; the final rule went into effect on September 8, 2023. The sole purpose of this rule is to amend specific provisions of the 2023 rule that are considered invalid under *Sackett*. The Amended 2023 Rule made the following changes:

1. "Interstate wetlands" were removed from paragraph (a)(1) waters;
2. The significant nexus standard for tributaries (paragraph (a)(3) waters), adjacent wetlands (paragraph (a)(4) waters), and intrastate lakes and ponds (paragraph (a)(5) waters was removed;
3. "Streams" and "wetlands" were removed from paragraph (a)(5) waters;
4. "Adjacent" was revised to mean "having a continuous surface connection" instead of "bordering, contiguous, or neighboring". Wetlands separated from other WOTUS by man-made dikes or barriers, natural river berms, beach dunes, and the like are no longer considered "adjacent wetlands".

No changes have been made to waters excluded by the 2023 Rule.

Ordinary High Water Mark

The landward limit of tidal WOTUS is the high-tide line. In non-tidal waters where adjacent wetlands are absent, the lateral limits of USACE jurisdiction extend to the ordinary high water mark (OHWM).[7] The OHWM is defined as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas".[8] When wetlands are present, the lateral limits of USACE jurisdiction extend beyond the OHWM to the limits of the adjacent wetlands.[9]

Wetlands

A wetland is a subset of jurisdictional waters and is defined by the USACE and the USEPA as "those areas that are inundated or saturated by surface or groundwater at a frequency and

[7] U.S. Army Corps of Engineers (USACE). 2005 (December 7). Regulatory Guidance Letter. Ordinary High Water Mark Identification. Washington, D.C.: USACE.
[8] *Code of Federal Regulations* (CFR), Title 33, §328.3(e)
[9] USACE 2005

duration sufficient to support, and under normal circumstances, do support a prevalence of vegetation typically adapted for life in saturated soil conditions".[10] Wetlands generally include swamps, marshes, bogs, and areas containing similar features.

The definition and methods for identifying wetland resources can be found in the USACE's *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region*,[11] a supplement to the 1987 *Corps of Engineers Wetlands Delineation Manual*.[12] Both the 1987 Wetlands Manual and the 2008 Arid West Supplement to the manual provide technical methods and guidelines for determining the presence of wetland WOTUS. Pursuant to these manuals, a three-parameter approach is used to identify wetlands and requires evidence of wetland hydrology, hydrophytic vegetation, and hydric soils. In order to be considered a wetland, an area must figure one or more indicators of all three of these parameters. However, problem areas may periodically or permanently lack certain indicators for reasons such as seasonal or annual variability of rainfall, vegetation, and other factors. Atypical wetlands lack certain indicators due to recent human activities or natural events. Guidance for determining the presence of wetlands in these situations is presented in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region*.

Section 404 Permit

Except as specified in Section 323.4 of the CFR, impacts to WOTUS require a Section 404 Permit. Permit authorization which may be in the form of (1) a "general permit" authorizing a category of activities in a specific geographical region or nationwide or (2) an "individual permit" (IP) following a review of an individual application form (to be obtained from the district office having jurisdiction over the waters in which the activity is proposed to be located).

Regulatory authorization in the form of a Nationwide Permit (NWP) is provided for certain categories of activities such as repair, rehabilitation, or replacement of a structure or fill which was previously authorized; utility line placement; or bank stabilization. NWPs authorize only those activities with minimal adverse effects on the aquatic environment and are valid only if the conditions applicable to the permits are met or waivers to these conditions are provided in writing from the USACE. Waivers may require consultation with affected federal and State agencies, which can be a lengthy process with no mandated processing time frames. Certain activities do not require submission of an application form, but may require a separate notification. If the NWP conditions cannot be met, an IP will be required. WOTUS temporarily filled, flooded, excavated, or drained but restored to pre-construction contours and elevations after construction are not included in the measurement of loss of WOTUS. The appropriate permit authorization will be based on the

[10] 33 CFR §328.3(b)

[11] USACE. 2008a. *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)*. (J.S. Wakeley, R.W. Lichvar, and C.V. Noble, Eds.). Vicksburg, MS: U.S. Army Engineer Research and Development Center.

[12] Environmental Laboratory. 1987. Cor*ps of Engineers Wetlands Delineation Manual (Technical Report Y-87-1)*. Vicksburg, MS: U.S. Army Engineer Waterways Experiment Station.

amount of impacts to WOTUS, as determined by the USACE. There is no filing fee for the Section 404 Permit.

Approximately three or four months are typically required to process a routine permit application; large or complex activities may take longer to process. When a permit application is received, it will be assigned an identification number and reviewed for completeness by the District Engineer. If an application is incomplete, additional information will be requested within 15 days of receipt of the application. If an application is complete, the District Engineer will issue a public notice within 15 days unless specifically exempted by provisions of the CFR. Public comments will be accepted no more than 30 days but not less than 15 days from the date of public notice; these will become part of the administrative record of the application. Generally, the District Engineer will decide on the application no later than 60 days after receipt of the completed application. Additional permit situations may increase the permit processing time (e.g., projects involving a Section 401 Water Quality Certification, a coastal zone management consistency analysis, historic properties, a federal agency, and/or Endangered species). The Project Applicant will be given time, not to exceed 30 days, to respond to requests of the District Engineer.

On January 31, 2007, the USACE published a memorandum clarifying the Interim Guidance for Amendments to the National Historic Preservation Act and the Advisory Council on Historic Preservation (ACHP) implementing regulations.[13] The Interim Guidance applies to all Department of the Army requests for authorization/verification, including Individual Permits (IPs, i.e., standard permits and letters of permission) and all Regional General Permits (RGPs) and Nationwide Permits (NWPs). The State or Tribal Historic Preservation Officer (SHPO/THPO) has 30 days to respond to a determination that a proposed activity, which otherwise qualifies for an NWP or an RGP, has no effect or no adverse effect on a historic property. If the SHPO/THPO does not respond within 30 days of notification, the Los Angeles District may proceed with verification. If the SHPO/THPO disagrees with the District's determination, the District may work with the SHPO/THPO to resolve the disagreement or request an opinion from the ACHP. The USACE will submit the Draft Jurisdictional Delineation Report to the SHPO/THPO for review prior to initiating the actual regulatory process.

If the USACE determines that the drainages/waterbodies are jurisdictional and would be impacted by project implementation, the Applicant will be required to obtain a CWA Section 401 Water Quality Certification from the RWQCB before the USACE will issue the Section 404 Permit. If the USACE determines that the impacted drainage/waterbody is not jurisdictional, the Applicant will be required to obtain RWQCB authorization under the provisions of a Report of Waste Discharge (ROWD).

Jurisdictional Determinations

Pursuant to USACE Regulatory Guidance Letter (RGL) 16-01 (dated October 2016), the USACE can issue two types of jurisdictional determinations to implement Section 404 of the CWA: Approved Jurisdictional Determinations (AJD) and Preliminary Jurisdictional Determinations (PJD).[14] An AJD is an official USACE determination that jurisdictional aquatic

[13] USACE. 2007 (January 31). Memorandum: Interim Guidance for Amendments to the National Historic Preservation Act and the Advisory Council on Historic Preservation (ACHP) Implementing Regulations. Washington, D.C.: USACE.

[14] USACE. 2008b (June 26). Regulatory Guidance Letter. Jurisdictional Determinations. Washington, D.C.: USACE.

resources (e.g., WOTUS) are either present or absent on a site. An AJD also identifies the precise limits of jurisdictional waters on a Project site.

AJDs may be either "stand-alone" AJDs or AJDs associated with permit actions. Some "stand-alone" AJDs may later be associated with permit actions, but at time of issuance are not related to a permit application. A "stand-alone" AJD may be requested so that impacts to jurisdictional aquatic resources may be avoided or minimized during the planning stages of a project, or it may be requested in order to fulfill a local/state authorization requirement.

The USACE will provide an AJD when (1) an Applicant requests an official jurisdictional determination; (2) an Applicant contests jurisdiction over a particular water body or wetland; or (3) when the USACE determines that jurisdiction does not exist over a particular water body or wetland. The AJD then becomes the USACE's official determination that can then be relied upon over a five-year period to request regulatory authorization as part of the permit application. In addition, an Applicant may decline to request an AJD and instead obtain a USACE IP or General Permit Authorization based on a Preliminary Jurisdictional Determination (PJD) or, in certain circumstances (e.g., authorizations by nonreporting nationwide general permits), with no Jurisdictional Determination.

PJDs are nonbinding, advisory in nature, and may not be appealed. They indicate that WOTUS may occur on a Project site. An Applicant may elect to use a PJD to voluntarily waive or set aside questions regarding CWA jurisdiction over a site, usually in the interest of expediting the permitting process. The USACE will determine what form of Jurisdictional Determination is appropriate for a particular Project site.

The USACE will coordinate with the USEPA per applicable memoranda. The USACE will continue to post final AJDs until they expire (generally five years). PJDs will not be coordinated with the USEPA or posted on USACE websites.

Regional Water Quality Control Board

The RWQCB is the primary agency responsible for protecting water quality in California through the regulation of discharges to surface waters under the CWA and the California Porter-Cologne Water Quality Control Act (Porter-Cologne Act). The RWQCB's jurisdiction extends to all waters of the State and to all WOTUS, including wetlands (isolated and non-isolated).

Section 401 of the CWA provides the RWQCB with the authority to regulate, through a Water Quality Certification, any proposed, federally permitted activity that may affect water quality. Among such activities are discharges of dredged or fill material permitted by the USACE pursuant to Section 404 of the CWA. Section 401 requires the RWQCB to provide certification that there is reasonable assurance that an activity which may result in discharge to navigable waters will not violate water quality standards. Water Quality Certification must be based on a finding that the proposed discharge will comply with water quality standards, which contain numeric and narrative objectives that can be found in each of the nine RWQCBs' Basin Plans.

The Porter-Cologne Act provides the State with very broad authority to regulate waters of the State (which are defined as any surface water or groundwater, including saline waters). The Porter-Cologne Act has become an important tool in the post-SWANCC (*Solid Waste Agency of Northern Cook Counties vs. United States Army Corps of Engineers*) and Rapanos era with respect to the State's authority over isolated waters. Generally, any person proposing to discharge waste into a water body that could affect its water quality must file an ROWD when there is no federal nexus, such as under Section 404(b)(1) of the CWA. Although "waste" is partially defined as any waste substance associated with human habitation, the RWQCB interprets this to include fill discharge into water bodies.

On April 2, 2019, the State Water Resources Control Board (SWRCB) adopted the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State. The procedures went into effect on May 28, 2020. Under these regulations, the SWRCB and its nine RWQCBs assert jurisdiction over all existing WOTUS and all waters that would have been considered WOTUS under the 2015 Rule. Thus, the WOTUS that are no longer under USACE jurisdiction would be under SWRCB jurisdiction.

Wetlands

In 2019, the SWRCB adopted rules to provide a common, statewide definition of what constitutes a wetland and to provide consistency in the way they and the RWQCBs regulate activities to protect wetlands and other waterways. The SWRCB defines an area as wetlands "if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation".[15] The following wetlands are waters of the State:

1. Natural wetlands,
2. Wetlands created by modification of a surface water of the State, and
3. Artificial wetlands that meet any of the following criteria:
    a. Approved by an agency as compensatory mitigation for impacts to other waters of the State, except where the approving agency explicitly identifies the mitigation as being of limited duration;
    b. Specifically identified in a water quality control plan as a wetland or other water of the State;
    c. Resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape; or
    d. Greater than or equal to one acre in size, unless the artificial wetland was constructed, and is currently used and maintained, primarily for one or more

[15] State Water Resources Control Board (SWRCB). 2019 (March 22). State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State.

of the following purposes (e.g., the following artificial wetlands are not waters of the State unless they also satisfy the criteria set forth in 2, 3a, or 3b):

i. Industrial or municipal wastewater treatment or disposal,

ii. Settling of sediment,

iii. Detention, retention, infiltration, or treatment of stormwater runoff and other pollutants or runoff subject to regulation under a municipal, construction, or industrial stormwater permitting program,

iv. Treatment of surface waters,

v. Agricultural crop irrigation or stock watering,

vi. Fire suppression,

vii. Industrial processing or cooling,

viii. Active surface mining – even if the site is managed for interim wetlands functions and values,

ix. Log storage,

x. Treatment, storage, or distribution of recycled water, or

xi. Maximizing groundwater recharge (this does not include wetlands that have incidental groundwater recharge benefits); or

xii. Fields flooded for rice growing.

All artificial wetlands that are less than an acre in size and do not satisfy the criteria set forth in 2, 3.a, 3.b, or 3.c are not waters of the State.

Section 401 Water Quality Certification

Issuance of the USACE Section 404 Permit would be contingent upon the approval of a Section 401 Water Quality Certification from the RWQCB. Also, the RWQCB requires certification of the project's California Environmental Quality Act (CEQA) documentation before it will approve the Section 401 Water Quality Certification or ROWD. The RWQCB, as a responsible agency, will use the project's CEQA document to satisfy its own CEQA-compliance requirements.

On June 1, 2020, the USEPA finalized the "Clean Water Act Section 401 Certification Rule" to implement the water quality certification process consistent with the text and structure of the CWA. The final rule establishes procedures that promote consistent implementation of CWA section 401 and regulatory certainty in the federal licensing and permitting process. The new regulation includes reviews and approvals by the USACE prior to the RWQCB issuing a 401 Certification and reviews and approvals by the USEPA prior to the USACE issuing a 404. The new 401 rule went into effect on September 11, 2020.

The new certification rule defines a discharge subject to 401 Certification as a discharge from a point source into a WOTUS. The new rule also states that States with additional water quality regulations cannot use these to expand the certification request.

The new rule requires all project proponents to request a pre-filing meeting with the RWQCB at least 30 days prior to filing a 401 "Certification Request". The filing procedure has been simplified to require the filing of a "Certification Request", rather than the acceptance of a "complete application". The certification request has nine mandatory components:

1. identify the project proponent(s) and a point of contact;
2. identify the proposed project;
3. identify the applicable federal license or permit;
4. identify the location and nature of any potential discharge that may result from the proposed project and the location of receiving waters;
5. include a description of any methods and means proposed to monitor the discharge and the equipment or measures planned to treat, control, or manage the discharge;
6. include a list of all other federal, interstate, tribal, state, territorial, or local agency authorizations required for the proposed project, including all approvals or denials already received;
7. include documentation that a pre-filing meeting request was submitted to the certifying authority at least 30 days prior to submitting the certification request;
8. contain the following statement: 'The project proponent hereby certifies that all information contained herein is true, accurate, and complete, to the best of my knowledge and belief; and
9. contain the following statement: 'The project proponent hereby requests that the certifying authority review and take action on this CWA 401 certification request within the applicable reasonable period of time.'

There is a mandatory 30 day wait period between a pre-filing meeting request and the filing of a Certification Request. A Certification Request must be filed with the RWQCB and the USACE concurrently. USACE reviews the Certification Request for the nine required components. The USACE has 15 days to review the Certification Request. The USACE then notifies the RWQCB that request is complete. And concurrently notifies the RWQCB of the reasonable time period to act on the Certification Request. The reasonable time period is not to exceed 1 year. Within 15 days of receipt of the Certification Request, the RWQCB must provide the applicant with the following: 1) date of receipt; 2) applicable reasonable period of time to act on the Certification Request; and 3) date upon which waiver will occur if the certifying authority fails or refuses to act on the Certification Request.

Once the RWQCB issues the 401 Certification, the USACE has 5 days to notify the USEPA that the 401 Certification has been issued. The USEPA then has 30 days to notify neighboring jurisdictions of the 401 Certification. Neighboring jurisdictions have 60 days to respond. If there are no objections to the 401 Certification, then the USACE would issue the 404 permit.

On June 2, 2021, the USEPA published a notice of intention to reconsider and revise the Clean Water Act Section 401 Certification Rule. On September 14, 2023, the USEPA announced the final 2023 Clean Water Act Section 401 Water Quality Certification Improvement Rule. This rule restores the fundamental authority granted by Congress to states, territories, and tribes

to protect water resources from adverse impacts that could result from federally licensed or permitted projects. The 2020 rule is currently in effect. This new, 2023 rule becomes effective 60 days after it is published in the federal register (i.e., November 14, 2023). Key components of the new rule include the following:

1. Pre-filing meeting request: The project proponent must request a pre-filing meeting at least 30 days prior to requesting certification (unless waived by the certifying authority).
2. Request for certification: The project proponent submits a request for certification to the certifying authority.
3. Setting reasonable period of time (RPT): The certifying authority and federal agency collaboratively determine how much time the certifying authority will have to review the request (up to one year), otherwise the review period defaults to six months unless an automatic extension applies.
4. Analysis: The certifying authority analyzes whether the activity will comply with their water quality requirements.
5. Certification Decision: The certifying authority determines whether to (1) grant certification, (2) grant certification with conditions, (3) deny certification, or (4) expressively waive certification.

The RWQCB is required under the *California Code of Regulations* (CCR) to have a "minimum 21-day public comment period" before any action can be taken on the Section 401 application.[16] This period closes when the RWQCB acts on the application. Since projects often change or are revised during the Section 401 permit process, the comment period can remain open. The public comment period starts as soon as an application has been received. Generally, the RWQCB Section 401, USACE Section 404, and CDFW Section 1602 permit applications are submitted at the same time.

The RWQCB requires the Applicant to address urban storm water runoff during and after construction in the form of Best Management Practices (BMPs). These BMPs are intended to address the treatment of pollutants carried by storm water runoff and are required in all complete applications. The notification/application for a CWA Section 401 Water Quality Certification must also address compliance with the Basin Plan. Please note that filing an application would also require the payment of an application fee which would be based on project impacts. The fee schedule calculator is available at https://www.waterboards.ca.gov/resources/fees/water_quality/docs/dredgefillcalculator.xlsm.

Waste Discharge Requirements

If no USACE Section 404 Permit is required, then the RWQCB issues Waste Discharge Requirements (WDRs) instead of a Section 401 Water Quality Certification. The RWQCB requires certification of the project's CEQA documentation before it will issue WDRs.

[16] 23 CCR §3858(a)

If operation or discharges from a Project affects California's surface, coastal, or groundwater, an application may need to obtain a permit to discharge waste from the appropriate RWQCB. For discharging, or proposing to discharge, pollutants into surface waters, an applicant must file completed federal National Pollutant Discharge Elimination System (NPDES) permit application forms with the appropriate RWQCB. For other types of discharges, such as those affecting groundwater or in a diffused manner (e.g., erosion from soil disturbance or waste discharge to land), an applicant must file a Report of Waste Discharge with the appropriate RWQCB to obtain WDRs. For specific situations, the RWQCB may waive the requirement to obtain a WDR for discharges to land or may determine that a proposed discharge can be permitted more effectively through enrollment in a general NPDES permit or general WDR.

To obtain WDRs, file the ROWD Form 200 with the necessary supplemental information with the RWQCB at least 120 days before beginning to discharge waste. The RWQCB reviews the application for completeness and may request additional information. Once the application is complete, the RWQCB determines whether they should adopt WDRs, prohibit the discharge, or waive the WDRs. If WDRs should be issued, the RWQCB prepares proposed WDRs and distributes them to persons and public agencies with known interest in the project for a minimum 30-day comment period. RWQCB staff members may modify the proposed WDRs based on comments received from the discharger and interested parties. The RWQCB holds a public hearing with at least a 30-day public notification. The RWQCB may adopt the proposed WDRs or modify and adopt them at the public hearing by majority vote. The entire process for developing and adopting the requirements normally takes about three months. WDRs are in effect until such time as the discharge is terminated or until revoked by the RWQCB. NPDES permits expire after five years and must be reissued.

There is no application fee for Form 200 (except for dairies). Instead, there is an annual fee that will be paid to the RWQCB.

California Department of Fish and Wildlife

The CDFW has jurisdictional authority over wetland resources associated with rivers, streams, and lakes pursuant to the *California Fish and Game Code*.[17] Activities of any person, State or local governmental agency, or public utility that are project proponents are regulated by the CDFW under Section 1602 of the *California Fish and Game Code.* This section regulates any work that will (1) substantially divert or obstruct the natural flow of any river, stream, or lake; (2) substantially change or use any material from the bed, channel, or bank of any river, stream, or lake; or (3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake. Section 1602 of the *California Fish and Game Code* applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State.

The CDFW jurisdictional limits are not as clearly defined by regulation as those of the USACE. While they closely resemble the limits described by USACE regulations, they include riparian habitat supported by a river, stream, or lake regardless of the presence or absence of hydric and saturated soils conditions. In general, the CDFW takes jurisdiction from the top of a stream bank or to the outer limits of the adjacent riparian vegetation (outer drip line),

[17] See §§1600–1616.

whichever is greater. Notification is generally required for any project that will take place within or in the vicinity of a river, stream, lake or within or in the vicinity of tributaries to a river, stream, or lake. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish and other aquatic plant and/or wildlife species. It also includes watercourses that have a surface or subsurface flow that support or have supported riparian vegetation.

Section 1602 Lake or Streambed Alteration Agreement

The CDFW enters into a Lake or Streambed Alteration (LSA) Agreement with a project proponent in order to ensure protection of wildlife and habitat values and acreages.

Prior to construction, a Notification of an LSA must be submitted to the CDFW that describes any proposed lake or streambed alteration that would occur with implementation of a project. The Notification of an LSA must address the initial construction and long-term operation and maintenance of any structures (such as a culvert or a desilting basin) included in the project design that are located within any river, stream, or lake and that may require periodic maintenance. In addition to the formal application materials and the fee, a copy of the appropriate environmental document (e.g., a Mitigated Negative Declaration) should be included in the submittal, consistent with CEQA requirements. The complete notification package must be submitted to the CDFW regional office that services the county where the activity will take place. This notification will serve as the basis for the CDFW's issuance of a Section 1602 LSA Agreement. Note that notification is not required before beginning emergency work, but the CDFW must be notified in writing within 14 days after beginning the work.

After receiving Notification of an LSA Agreement, the CDFW will determine whether an LSA Agreement will be required for the proposed activity. An LSA Agreement will be required if the activity could substantially adversely affect an existing fish and wildlife resource. If an LSA Agreement is required, the CDFW may want to conduct an on-site inspection.

If the CDFW does not respond in writing concerning the completeness of the Notification within 30 days of its submittal, the Notification automatically becomes complete. If the CDFW does not submit a draft LSA Agreement to the Applicant within 60 days of the determination of a completed Notification package, the CDFW will issue a letter that either (1) identifies the final date to transmit a draft LSA Agreement or (2) indicates that an LSA Agreement was not required. The CDFW will also indicate that it was unable to meet this mandated compliance date and that, by law, the Applicant is authorized to complete the project without an LSA Agreement as long as the Applicant constructs the project as proposed and complies with all avoidance, minimization, and mitigation measures described in the submitted Notification package. If the project requires revisions to the design or project construction, the CDFW may require submittal of a new Notification/application with an additional 90-day permit process.

If determined to be necessary, the CDFW will prepare a draft LSA Agreement, which will include standard measures to protect fish and wildlife resources during project construction and during ongoing operation and maintenance of any project element that occurs within a CDFW jurisdictional area. The draft Agreement must be transmitted to the Applicant within

60 calendar days of the CDFW's determination that the notification is complete. It should be noted that the 60-day timeframe might not apply to long-range agreements.

Following receipt of a draft LSA Agreement from the CDFW, the Applicant has 30 calendar days to notify the CDFW concerning the acceptability of the proposed terms, conditions, and measures. If the Applicant agrees with these terms, conditions and measures, the Agreement must be signed and returned to the CDFW. The Agreement becomes final once the CDFW executes it and an LSA Agreement is issued. All application fees must be paid and the final certified CEQA documentation must be provided prior to the CDFW's execution of the Agreement.

ATTACHMENT B

NATIONAL WETLAND INVENTORY DEFINITIONS

NATIONAL WETLANDS INVENTORY

The descriptions for resources mapped by the National Wetlands Inventory in the survey area (see Exhibit 6) are provided below.

Lacustrine Features: L1UBHh, L2ABFh, L2EM2Fh, L2UBFh, L2USAh, L2USCh

- **L: System LACUSTRINE.** The Lacustrine System includes wetlands and deepwater habitats with all of the following characteristics: (1) situated in a topographic depression or a dammed river channel; (2) lacking trees, shrubs, persistent emergents, and emergent mosses or lichens with 30 percent or greater areal coverage; and (3) total area of at least 8 hectares (ha) (20 acres). Similar wetlands and deepwater habitats totaling less than 8 ha are also included in the Lacustrine System if an active wave-formed or bedrock shoreline feature makes up all or part of the boundary, or if the water depth in the deepest part of the basin equals or exceeds 2.5 meters (8.2 feet) at low water. Lacustrine waters may be tidal or nontidal, but ocean-derived salinity is always less than 0.5 part per trillion (ppt).
    - **1: Subsystem LIMNETIC.** This Subsystem includes all deepwater habitats (i.e., areas > 2.5 meters [8.2 feet] deep below low water) in the Lacustrine System. Many small Lacustrine Systems have no Limnetic Subsystem.
    - **2: Subsystem LITTORAL.** This Subsystem includes all wetland habitats in the Lacustrine System. It extends from the shoreward boundary of the System to a depth of 2.5 meters (8.2 feet) below low water, or to the maximum extent of nonpersistent emergents if these grow at depths greater than 2.5 meters.
        - **AB: Class AQUATIC BED.** Includes wetlands and deepwater habitats dominated by plants that grow principally on or below the surface of the water for most f the growing season in most years.
        - **EM: Class EMERGENT.** Characterized by erect, rooted, herbaceous hydrophytes, excluding mosses and lichens. This vegetation is present for most of the growing season in most years. These wetlands are usually dominated by perennial plants.
        - **UB: Class UNCONSOLIDATED BOTTOM.** Includes all wetlands and deepwater habitats with at least 25% cover of particles smaller than stones (less than 6-7 centimeters), and a vegetative cover less than 30%.
        - **US: Class UNCONSOLIDATED SHORE.** Includes all wetland habitats having two characteristics: (1) unconsolidated substrates with less than 75 percent areal cover or stones, boulders, or bedrock and (2) less than 30 percent areal cover of vegetation. Landforms such as beaches, bars, and flats are included in the Unconsolidated Shore class.
            - **2: Subclass NON-PERSISTENT.** Wetlands in this subclass are dominated by plants which fall to the surface of the substrate or below the surface of the water at the end of the growing season so that, at certain seasons of the year, there is no obvious sign of emergent vegetation.

- **A: Water Regime TEMPORARY FLOODED.** Surface water is present for brief periods (from a few days to a few weeks) during the growing season, but the water table usually lies well below the ground surface for most of the season.
- **C: Water Regime SEASONALLY FLOODED.** Surface water is present for extended periods especially early in the growing season, but is absent by the end of the growing season in most years. The water table after flooding ceases is variable, extending from saturated to the surface to a water table well below the ground surface.
- **F: Water Regime SEMIPERMANENTLY FLOODED.** Surface water persists throughout the growing season in most years. When surface water is absent, the water table is usually at or very near the land surface.
- **H: Water Regime PERMANENTLY FLOODED.** Water covers the substrate throughout the year in all years.
    - **h: Special Modifier DIKED/IMPOUNDED.** These wetlands have been created or modified by a man-made barrier or dam that obstructs the inflow or outflow of water.

Riverine Features: R2UBF, R2USC, R4SBA, R4SBAr, R4SBC, and R4SBCr

- **R: System RIVERINE.** The Riverine System includes all wetlands and deepwater habitats contained within a channel, with two exceptions: (1) wetlands dominated by trees, shrubs, persistent emergents, emergent mosses, or lichens and (2) habitats with water containing ocean-derived salts of 0.5 ppt or greater. A channel is an open conduit either naturally or artificially created which periodically or continuously contains moving water, or which forms a connecting link between two bodies of standing water.
    - **2: Subsystem: LOWER PERENNIAL.** This Subsystem is characterized by a low gradient. There is no tidal influence and some water flows all year, except during years of extreme drought. This substrate consists mainly of sand and mud. Oxygen deficits may sometimes occur. The fauna is composed mostly of species that reach their maximum abundance in still water and true planktonic organisms are common. The gradient is lower than that of the Upper Perennial Subsystem and the floodplain is well developed.
    - **4: Subsystem INTERMITTENT.** This Subsystem includes channels that contain flowing water only part of the year. When the water is not flowing, it may remain in isolated pools or surface water may be absent.
        - **SB: Class STREAMBED.** Includes all wetlands contained within the Intermittent Subsystem of the Riverine System and all channels of the

Estuarine System or of the Tidal Subsystem of the Riverine System that are completely dewatered at low tide.

- **UB: Class UNCONSOLIDATED BOTTOM.** Includes all wetlands and deepwater habitats with at least 25% cover of particles smaller than stones (less than 6-7 centimeters), and a vegetative cover less than 30%.
- **US: Class UNCONSOLIDATED SHORE.** Includes all wetland habitats having two characteristics: (1) unconsolidated substrates with less than 75 percent areal cover or stones, boulders, or bedrock and (2) less than 30 percent areal cover of vegetation. Landforms such as beaches, bars, and flats are included in the Unconsolidated Shore class.
  - **A: Water Regime TEMPORARY FLOODED.** Surface water is present for brief periods (from a few days to a few weeks) during the growing season, but the water table usually lies well below the ground surface for most of the season.
  - **C: Water Regime SEASONALLY FLOODED.** Surface water is present for extended periods, especially early in the growing season, but is absent by the end of the growing season in most years. The water table after flooding ceases is variable, extending from saturated to the surface to a water table well below the ground surface.
  - **F: Water Regime SEMIPERMANENTLY FLOODED.** Surface water persists throughout the growing season in most years. When surface water is absent, the water table is usually at or very near the land surface.
    - **r: Special Modifier ARTIFICIAL SUBSTRATE.** This Modifier describes concrete-lined drainage ways, as well as Rock Bottom, Unconsolidated Bottom, Rocky Shore, and Unconsolidated Shore where the substrate material has been emplaced by humans. Jetties and breakwaters are examples of Artificial Rocky Shores.

Palustrine Features: PEM1C, PFOC, PFOCh, PFO/EM1Ch, PFO/SSA PSSA, PSSC, PSS/EM1C

- **P: System PALUSTRINE.** The Palustrine System includes all nontidal wetlands dominated by trees, shrubs, emergents, mosses, or lichens and all such wetlands that occur in tidal areas where salinity due to ocean-derived salts is below 0.5 part per trillion (ppt). It also includes wetlands lacking such vegetation but with all of the following four characteristics: (1) area less than 8 ha (20 acres), (2) active wave-formed or bedrock shoreline features lacking, (3) water depth in the deepest part of the basin less than 2.5 meters (8.2 feet) at low water, and (4) salinity due to ocean-derived salts less than 0.5 ppt.

- **EM: Class EMERGENT.** Characterized by erect, rooted, herbaceous hydrophytes, excluding mosses and lichens. This vegetation is present for most of the growing season in most years. These wetlands are usually dominated by perennial plants.
- **FO: Class FORESTED.** Characterized by woody vegetation that is 6 meters tall or taller.
- **SS: Class SCRUB-SHRUB.** Includes areas dominated by woody vegetation less than 6 meters (20 feet) tall. The species include true shrubs, young trees (saplings), and trees or shrubs that are small or stunted because of environmental conditions.
    - **1: Subclass PERSISTENT.** This subclass is dominated by species that normally remain standing at least until the beginning of the next growing season. This subclass is found only in the Estuarine and Palustrine systems.
        - **A: Water Regime TEMPORARY FLOODED.** Surface water is present for brief periods (from a few days to a few weeks) during the growing season, but the water table usually lies well below the ground surface for most of the season.
        - **C: Water Regime SEASONALLY FLOODED.** Surface water is present for extended periods especially early in the growing season, but is absent by the end of the growing season in most years. The water table after flooding ceases is variable, extending from saturated to the surface to a water table well below the ground surface.
            - **h: Special Modifier DIKED/IMPOUNDED.** These wetlands have been created or modified by a man-made barrier or dam that obstructs the inflow or outflow of water.

DATASHEETS

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Santiago Creek Dam City/County: unincorporated Orange Co. Sampling Date: 3/24/2020

Applicant/Owner: IRWD State: CA Sampling Point: 1

Investigator(s): ARudalevige Section, Township, Range: 28, T04S, R08W

Landform (hillslope, terrace, etc.): canyon Local relief (concave, convex, none): concave Slope (%): 1

Subregion (LRR): California Lat: 33.78804° Long: -117.72701° Datum: NAD 83

Soil Map Unit Name: Anaheim clay loam, 50-75% slopes NWI classification: R4SBC

Are climatic / hydrologic conditions on the site typical for this time of year? Yes Y No ____ (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes Y No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes Y No ____	**Is the Sampled Area within a Wetland?** Yes ____ No Y
Hydric Soil Present?	Yes ____ No Y	
Wetland Hydrology Present?	Yes Y No ____	

Remarks: Sampling point is in a steep canyon below the Santiago Dam Spillway

VEGETATION – Use scientific names of plants.

	Absolute % Cover	Dominant Species?	Indicator Status
Tree Stratum (Plot size: 30')			
1. Salix gooddingii	40	Y	FACW
2. Populus fremontii	5	N	UPL
3.			
4.			
	45	= Total Cover	
Sapling/Shrub Stratum (Plot size: 5')			
1. Baccharis salicifolia ssp. S.	1	N	FAC
2.			
3.			
4.			
5.			
	1	= Total Cover	
Herb Stratum (Plot size: 5')			
1. Typha sp. *	5	N	OBL
2. Bromus rubens	10	Y	UPL
3. Pulicaria paludosa	20	Y	FAC
4. Melilotus albus	1	N	UPL
5.

1.			
2.			
	0	= Total Cover	

% Bare Ground in Herb Stratum 64 % Cover of Biotic Crust 0

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 3 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 66.6% (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:
OBL species ____	x 1 = ____
FACW species ____	x 2 = ____
FAC species ____	x 3 = ____
FACU species ____	x 4 = ____
UPL species ____	x 5 = ____
Column Totals: ____ (A)	____ (B)

Prevalence Index = B/A = ____

Hydrophytic Vegetation Indicators:

Y Dominance Test is >50%

__ Prevalence Index is ≤3.0[1]

__ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

__ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes Y No ____

Remarks:

SOIL

Sampling Point: 1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-2	10YR 4/2	100					loamy clay	
2-12	10YR 4/4	100					loamy clay	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: rock & roots

Depth (inches): 12

Hydric Soil Present? Yes ___ No Y

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Y Surface Water (A1)
- Y High Water Table (A2)
- Y Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- Y Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes Y No ___ Depth (inches): 6"

Water Table Present? Yes Y No ___ Depth (inches): 4"

Saturation Present? (includes capillary fringe) Yes Y No ___ Depth (inches): 1"

Wetland Hydrology Present? Yes Y No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Sampled following a rain event.

Percent of Dominant Species That Are OBL, FACW, or FAC: 100% (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:
OBL species ____	x 1 = ____
FACW species ____	x 2 = ____
FAC species ____	x 3 = ____
FACU species ____	x 4 = ____
UPL species ____	x 5 = ____
Column Totals: ____ (A)	____ (B)

Prevalence Index = B/A = ____

Hydrophytic Vegetation Indicators:
X Dominance Test is >50%
__ Prevalence Index is ≤3.0[1]
__ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
__ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ____ No ____

Remarks:
Vegetation in lakebed varies based on water level, which is affected by inflow, precipitation, + releases from the dam, leading to temporal shifts in vegetation.

SOIL

Sampling Point: 3

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks

Stream: Santiago Creek **Photo begin file#:** **Photo end file#:**
Investigator(s): A Rudalevige

Y ☑ / N ☐ Do normal circumstances exist on the site?

Y ☐ / N ☑ Is the site significantly disturbed?

Location Details: Below Irvine Lake spillway at canyon mouth

Projection: **Datum:**

Coordinates: 33° 47.953', -117° 43.565'

Potential anthropogenic influences on the channel system:
Santiago Dam (impoundment) and controlled releases of flow. Access road with Arizona Crossing.

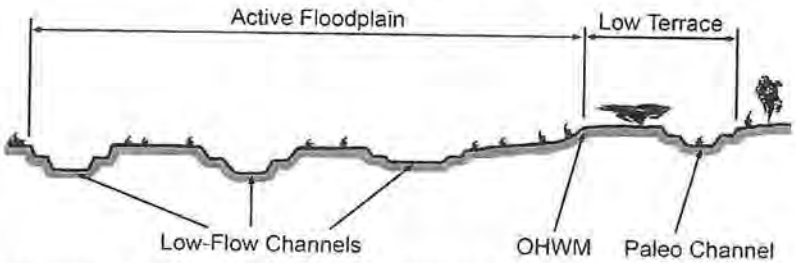
Brief site description: Floodplain of Santiago Creek downstream of Irvine Lake.

Checklist of resources (if available):

- ☑ Aerial photography
  Dates: 2018
- ☒ Topographic maps
- ☐ Geologic maps
- ☑ Vegetation maps
- ☑ Soils maps
- ☐ Rainfall/precipitation maps
- ☐ Existing delineation(s) for site
- ☐ Global positioning system (GPS)
- ☐ Other studies

- ☑ Stream gage data
  Gage number: 11075800 (upstream of dam)
  Period of record:
  - ☐ History of recent effective discharges
  - ☐ Results of flood frequency analysis
  - ☐ Most recent shift-adjusted rating
  - ☐ Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

Hydrogeomorphic Floodplain Units



Procedure for identifying and characterizing the floodplain units to assist in identifying the OHWM:

1. Walk the channel and floodplain within the study area to get an impression of the geomorphology and vegetation present at the site.
2. Select a representative cross section across the channel. Draw the cross section and label the floodplain units.
3. Determine a point on the cross section that is characteristic of one of the hydrogeomorphic floodplain units.
   a) Record the floodplain unit and GPS position.
   b) Describe the sediment texture (using the Wentworth class size) and the vegetation characteristics of the floodplain unit.
   c) Identify any indicators present at the location.
4. Repeat for other points in different hydrogeomorphic floodplain units across the cross section.
5. Identify the OHWM and record the indicators. Record the OHWM position via:
   - ☑ Mapping on aerial photograph
   - ☐ Digitized on computer
   - ☐ GPS
   - ☐ Other:

- ☐ Surface relief
- ☐ Other: _____
- ☐ Other: _____
- ☐ Other: _____

Comments:

No low terrace; active floodplain extends to vertical banks.

Arid West Ephemeral and Intermittent Streams OHWM Datasheet

Project: Santiago Creek Dam Outlet Tower + Spillway Improvement **Date:** 10/14/2020 **Time:** 11:20 AM
Project Number: 3iRW000904 **Town:** unincorporated OC **State:** CA
Stream: unnamed (Drainage 12) **Photo begin file#:** **Photo end file#:**
Investigator(s): ARudalevige, JAguayo

Y ☑ / N ☐ Do normal circumstances exist on the site?

Y ☐ / N ☑ Is the site significantly disturbed?

Location Details: representative section of Drainage 12

Projection: **Datum:** NAD 83
Coordinates: 33.763575, -117.708999

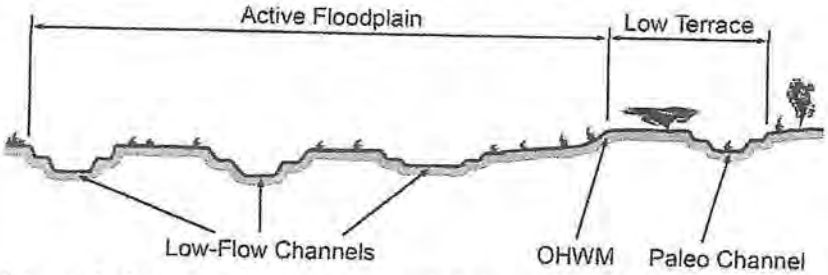
Potential anthropogenic influences on the channel system:
Above grade road crosses drainage downstream of sampling point.

Brief site description:
Braided drainage that discharges into Irvine Lake

Checklist of resources (if available):

- ☑ Aerial photography
  Dates: 2018
- ☑ Topographic maps
- ☐ Geologic maps
- ☑ Vegetation maps
- ☑ Soils maps
- ☐ Rainfall/precipitation maps
- ☐ Existing delineation(s) for site
- ☐ Global positioning system (GPS)
- ☐ Other studies
- ☐ Stream gage data
  Gage number:
  Period of record:
  - ☐ History of recent effective discharges
  - ☐ Results of flood frequency analysis
  - ☐ Most recent shift-adjusted rating
  - ☐ Gage heights for 2-, 5-, 10-, and 25-year events and the most recent event exceeding a 5-year event

Hydrogeomorphic Floodplain Units



Procedure for identifying and characterizing the floodplain units to assist in identifying the OHWM:

1. Walk the channel and floodplain within the study area to get an impression of the geomorphology and vegetation present at the site.
2. Select a representative cross section across the channel. Draw the cross section and label the floodplain units.
3. Determine a point on the cross section that is characteristic of one of the hydrogeomorphic floodplain units.
   a) Record the floodplain unit and GPS position.
   b) Describe the sediment texture (using the Wentworth class size) and the vegetation characteristics of the floodplain unit.
   c) Identify any indicators present at the location.
4. Repeat for other points in different hydrogeomorphic floodplain units across the cross section.
5. Identify the OHWM and record the indicators. Record the OHWM position via:
   - ☐ Mapping on aerial photograph
   - ☐ Digitized on computer
   - ☐ GPS
   - ☐ Other:

Wentworth Size Classes

Inches (in)	Millimeters (mm)	Wentworth size class

ATTACHMENT F

LITERATURE REVIEW DETAILS – SOILS

This attachment provides detailed results of the literature review regarding soils mapped in the survey area.

SOIL SERIES

The below text is the detailed soil information obtained from the Map Unit Description found in the legend of the USDA NRCS website.[24]

104—Alo variant clay, 15 to 30 percent slopes

Map Unit Setting

- *National map unit symbol:* hclc
- *Elevation:* 200 to 1,590 feet
- *Mean annual precipitation:* 14 to 15 inches
- *Mean annual air temperature:* 64 to 66 degrees Fahrenheit (F)
- *Frost-free period:* 365 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Alo variant and similar soils:* 70 percent
- *Alo variant, calcareous, and similar soils:* 20 percent
- *Minor components:* 10 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Alo Variant

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from sedimentary rock

Typical profile

- *H1 - 0 to 25 inches:* clay
- *H2 - 25 to 38 inches:* clay
- *H3 - 38 to 59 inches:* weathered bedrock

Properties and qualities

- *Slope:* 15 to 30 percent
- *Depth to restrictive feature:* 20 to 40 inches to paralithic bedrock
- *Drainage class:* Well drained

[24] U.S. Department of Agriculture, Natural Resources Conservation Service (USDA NRCS). 2019. Web Soil Survey. Records for the Survey Area, as Area of Interest. Further information about Soil Map Units. Lincoln, NE: USDA NRCS https://websoilsurvey.sc.egov.usda.gov/App/WebSoilSurvey.aspx.

- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Calcium carbonate, maximum content:* 5 percent
- *Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
- *Available water capacity:* Moderate (about 6.1 inches)

Interpretive groups

- *Land capability classification (irrigated):* 4e
- *Land capability classification (nonirrigated):* 4e
- *Hydrologic Soil Group:* D
- *Ecological site:* R019XD001CA
- *Hydric soil rating:* No

Description of Alo Variant, Calcareous

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex

Properties and qualities

- *Depth to restrictive feature:* More than 80 inches
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None

Minor Components

Bosanko, clay

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Myford, sandy loam

- *Percent of map unit:* 3 percent
- *Hydric soil rating:* No

Anaheim, clay loam

- *Percent of map unit:* 2 percent
- *Hydric soil rating:* No

105—Alo variant clay, 30 to 50 percent slopes

Map Unit Setting

- *National map unit symbol:* hcld
- *Elevation:* 210 to 1,740 feet
- *Mean annual precipitation:* 14 to 15 inches
- *Mean annual air temperature:* 64 to 66 degrees F
- *Frost-free period:* 365 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Alo variant and similar soils:* 70 percent
- *Alo variant, calcareous, and similar soils:* 20 percent
- *Minor components:* 10 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Alo Variant

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from sedimentary rock

Typical profile

- *H1 - 0 to 25 inches:* clay
- *H2 - 25 to 38 inches:* clay
- *H3 - 38 to 59 inches:* weathered bedrock

Properties and qualities

- *Slope:* 30 to 50 percent
- *Depth to restrictive feature:* 20 to 40 inches to paralithic bedrock
- *Drainage class:* Well drained
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Calcium carbonate, maximum content:* 5 percent
- *Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
- *Available water capacity:* Moderate (about 6.1 inches)

Interpretive groups

- *Land capability classification (irrigated):* None specified
- *Land capability classification (nonirrigated):* 6e

- *Hydrologic Soil Group:* D
- *Ecological site:* R019XD001CA
- *Hydric soil rating:* No

Description of Alo Variant, Calcareous

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex

Properties and qualities

- *Depth to restrictive feature:* More than 80 inches
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None

Minor Components

Bosanko, clay

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Calleguas, clay loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

106—Anaheim loam, 15 to 30 percent slopes

Map Unit Setting

- *National map unit symbol:* hclf
- *Elevation:* 100 to 1,930 feet
- *Mean annual precipitation:* 12 to 20 inches
- *Mean annual air temperature:* 63 to 65 degrees F
- *Frost-free period:* 320 to 365 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Anaheim and similar soils:* 85 percent
- *Minor components:* 15 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Anaheim

Setting

- *Landform:* Hillslopes
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Parent material:* Fine grained residuum weathered from sandstone and shale

Typical profile

- *A1 - 0 to 9 inches:* loam
- *A2 - 9 to 17 inches:* loam
- *A3 - 17 to 26 inches:* loam
- *Cr - 26 to 54 inches:* bedrock

Properties and qualities

- *Slope:* 15 to 30 percent
- *Depth to restrictive feature:* 20 to 39 inches to paralithic bedrock
- *Drainage class:* Well drained
- *Runoff class:* High
- *Capacity of the most limiting layer to transmit water (Ksat):* Very low to moderately low (0.00 to 0.06 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Low (about 4.7 inches)

Interpretive groups

- *Land capability classification (irrigated):* None specified
- *Land capability classification (nonirrigated):* 4e
- *Hydrologic Soil Group:* C
- *Ecological site:* R019XD029CA
- *Hydric soil rating:* No

Minor Components

Anaheim, clay loam

- *Percent of map unit:* 7 percent
- *Landform:* Hillslopes
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Ecological site:* R019XD001CA
- *Hydric soil rating:* No

Nacimiento, clay loam

- *Percent of map unit:* 5 percent
- *Landform:* Hillslopes
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope

110—Anaheim clay loam, 50 to 75 percent slopes

Map Unit Setting

- *National map unit symbol:* hclk
- *Elevation:* 100 to 2,500 feet
- *Mean annual precipitation:* 12 to 20 inches
- *Mean annual air temperature:* 61 to 63 degrees F
- *Frost-free period:* 300 to 350 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Anaheim and similar soils:* 90 percent
- *Minor components:* 10 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Anaheim

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Parent material:* Fine grained residuum weathered from sandstone and shale

Typical profile

- *H1 - 0 to 21 inches:* clay loam
- *H2 - 21 to 59 inches:* weathered bedrock

Properties and qualities

- *Slope:* 50 to 75 percent
- *Depth to restrictive feature:* 20 to 36 inches to paralithic bedrock
- *Natural drainage class:* Well drained
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately high (0.20 to 0.57 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water storage in profile:* Low (about 3.8 inches)

Interpretive groups

- *Land capability classification (irrigated):* None specified
- *Land capability classification (nonirrigated):* 7e

Typical profile

- *H1 - 0 to 17 inches:* sandy loam
- *H2 - 17 to 59 inches:* weathered bedrock

Properties and qualities

- *Slope:* 15 to 30 percent
- *Depth to restrictive feature:* 4 to 20 inches to paralithic bedrock
- *Drainage class:* Somewhat excessively drained
- *Capacity of the most limiting layer to transmit water (Ksat):* High (1.98 to 5.95 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Very low (about 2.5 inches)

Interpretive groups

- *Land capability classification (irrigated):* 4e
- *Land capability classification (nonirrigated):* 4e
- *Hydrologic Soil Group:* D
- *Ecological site:* R019XD060CA - SHALLOW LOAMY (1975)
- *Hydric soil rating:* No

Minor Components

San andreas, sandy loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Soper, gravelly loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Anaheim, loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

142—Cieneba sandy loam, 30 to 75 percent slopes, eroded

Map Unit Setting

- *National map unit symbol:* hcml
- *Elevation:* 500 to 4,000 feet
- *Mean annual precipitation:* 12 to 35 inches

- *Mean annual air temperature:* 57 to 64 degrees F
- *Frost-free period:* 200 to 300 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Cieneba and similar soils:* 65 percent
- *Minor components:* 35 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Cieneba

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Concave, convex
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from granite

Typical profile

- *H1 - 0 to 7 inches:* sandy loam
- *H2 - 7 to 59 inches:* weathered bedrock

Properties and qualities

- *Slope:* 30 to 75 percent
- *Depth to restrictive feature:* 4 to 20 inches to paralithic bedrock
- *Drainage class:* Somewhat excessively drained
- *Runoff class:* Medium
- *Capacity of the most limiting layer to transmit water (Ksat):* Very low to moderately low (0.00 to 0.06 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Very low (about 1.1 inches)

Interpretive groups

- *Land capability classification (irrigated):* None specified
- *Land capability classification (nonirrigated):* 7e
- *Hydrologic Soil Group:* D
- *Ecological site:* R019XD060CA - SHALLOW LOAMY (1975)
- *Hydric soil rating:* No

Minor Components

Cieneba, uneroded

- *Percent of map unit:* 10 percent
- *Hydric soil rating:* No

Vista, sandy loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Soper, cobbly loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Calleguas, clay loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

San andreas, sandy loam

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Rock outcrop

- *Percent of map unit:* 2 percent
- *Hydric soil rating:* No

Tollhouse

- *Percent of map unit:* 2 percent
- *Hydric soil rating:* No

Blasingame, loam

- *Percent of map unit:* 1 percent
- *Hydric soil rating:* No

145—Cieneba–rock outcrop complex, 30 to 75 percent slopes

Map Unit Setting

- *National map unit symbol:* hcmp
- *Elevation:* 500 to 4,000 feet
- *Mean annual precipitation:* 8 to 35 inches
- *Mean annual air temperature:* 45 to 64 degrees F
- *Frost-free period:* 110 to 300 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Cieneba and similar soils:* 60 percent
- *Rock outcrop:* 30 percent
- *Minor components:* 10 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Cieneba

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Concave, convex
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from granite

Typical profile

- *H1 - 0 to 7 inches:* sandy loam
- *H2 - 7 to 59 inches:* weathered bedrock

Properties and qualities

- *Slope:* 30 to 75 percent
- *Depth to restrictive feature:* 7 to 20 inches to paralithic bedrock
- *Natural drainage class:* Somewhat excessively drained
- *Runoff class:* Medium
- *Capacity of the most limiting layer to transmit water (Ksat):* Very low to moderately low (0.00 to 0.06 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water storage in profile:* Very low (about 1.1 inches)

Interpretive groups

- *Land capability classification (irrigated):* None specified

- *Hydric soil rating:* No

Tollhouse, soils

- *Percent of map unit:* 2 percent
- *Hydric soil rating:* No

Vista, coarse sandy loam

- *Percent of map unit:* 1 percent
- *Hydric soil rating:* No

146—Corralitos loamy sand

Map Unit Setting

- *National map unit symbol:* hcmq
- *Elevation:* 30 to 1,000 feet
- *Mean annual precipitation:* 12 to 30 inches
- *Mean annual air temperature:* 57 to 61 degrees F
- *Frost-free period:* 230 to 300 days
- *Farmland classification:* Prime farmland if irrigated

Map Unit Composition

- *Corralitos and similar soils:* 65 percent
- *Minor components:* 35 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Corralitos

Setting

- *Landform:* Alluvial fans
- *Landform position (two-dimensional):* Toeslope
- *Landform position (three-dimensional):* Riser, flat

- *Down-slope shape:* Linear
- *Across-slope shape:* Linear
- *Parent material:* Alluvium derived from mixed

Typical profile

- *H1 - 0 to 9 inches:* loamy sand
- *H2 - 9 to 60 inches:* stratified sand to loamy sand

Properties and qualities

- *Slope:* 0 to 5 percent
- *Depth to restrictive feature:* More than 80 inches
- *Drainage class:* Somewhat excessively drained
- *Runoff class:* Negligible
- *Capacity of the most limiting layer to transmit water (Ksat):* High to very high (5.95 to 19.98 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Low (about 4.8 inches)

Interpretive groups

- *Land capability classification (irrigated):* 3s
- *Land capability classification (nonirrigated):* 3e
- *Hydrologic Soil Group:* A
- *Ecological site:* R019XD035CA
- *Hydric soil rating:* No

Minor Components

Unnamed

- *Percent of map unit:* 20 percent
- *Hydric soil rating:* No

Riverwash

- *Percent of map unit:* 5 percent
- *Landform:* Fans
- *Hydric soil rating:* Yes

Metz, loamy sand

- *Percent of map unit:* 5 percent
- *Hydric soil rating:* No

Soboba, gravelly loamy sand

- *Percent of map unit:* 3 percent
- *Hydric soil rating:* No

Capistrano, sandy loam

- *Percent of map unit:* 2 percent
- *Hydric soil rating:* No

173—Myford sandy loam, 2 to 9 percent slopes

Map Unit Setting

- *National map unit symbol:* hcnl
- *Elevation:* 0 to 1,560 feet
- *Mean annual precipitation:* 11 to 18 inches
- *Mean annual air temperature:* 62 to 65 degrees F
- *Frost-free period:* 320 to 365 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Myford and similar soils:* 75 percent
- *Minor components:* 25 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Myford

Setting

- *Landform:* Terraces
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Tread
- *Down-slope shape:* Linear
- *Across-slope shape:* Linear
- *Parent material:* Alluvium derived from sandstone

Typical profile

- *A1 - 0 to 1 inches:* sandy loam
- *A2 - 1 to 4 inches:* sandy loam
- *A3 - 4 to 12 inches:* sandy loam
- *Bt1 - 12 to 18 inches:* sandy clay
- *Bt2 - 18 to 28 inches:* sandy clay loam
- *Btk1 - 28 to 35 inches:* sandy clay loam
- *Btk2 - 35 to 41 inches:* sandy clay loam
- *B't1 - 41 to 49 inches:* sandy clay loam
- *B't2 - 49 to 61 inches:* sandy clay loam
- *Bt3 - 61 to 71 inches:* sandy clay loam
- *C - 71 to 79 inches:* sandy loam

Properties and qualities

- *Slope:* 2 to 9 percent
- *Depth to restrictive feature:* 8 to 20 inches to abrupt textural change
- *Drainage class:* Moderately well drained
- *Runoff class:* High

- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately high (0.20 to 0.60 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Calcium carbonate, maximum content:* 5 percent
- *Maximum salinity:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
- *Available water capacity:* Very low (about 1.5 inches)

Interpretive groups

- *Land capability classification (irrigated):* None specified
- *Land capability classification (nonirrigated):* 3e

- *Hydric soil rating:* No

203—Soper cobbly loam, 15 to 50 percent slopes

Map Unit Setting

- *National map unit symbol:* hcpk
- *Elevation:* 100 to 2,500 feet
- *Mean annual precipitation:* 12 to 25 inches
- *Mean annual air temperature:* 64 to 66 degrees F
- *Frost-free period:* 250 to 350 days
- *Farmland classification:* Not prime farmland

Map Unit Composition

- *Soper and similar soils:* 85 percent
- *Minor components:* 15 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Soper

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope
- *Landform position (three-dimensional):* Side slope
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from sandstone

Typical profile

- *H1 - 0 to 9 inches:* cobbly loam
- *H2 - 9 to 30 inches:* cobbly clay loam, cobbly sandy clay loam, cobbly loam
- *H2 - 9 to 30 inches:* weathered bedrock

- *H2 - 9 to 30 inches:*
- *H3 - 30 to 59 inches:*

Properties and qualities

- *Slope:* 15 to 50 percent
- *Depth to restrictive feature:* 20 to 36 inches to paralithic bedrock
- *Drainage class:* Well drained
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately high (0.20 to 0.57 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* High (about 9.6 inches)

Interpretive groups

207—Sorrento loam, 2 to 9 percent slopes, warm MAAT, MLRA 19

Map Unit Setting

- *National map unit symbol:* 2tz0c
- *Elevation:* 0 to 1,340 feet
- *Mean annual precipitation:* 12 to 18 inches
- *Mean annual air temperature:* 62 to 66 degrees F
- *Frost-free period:* 320 to 365 days
- *Farmland classification:* Prime farmland if irrigated

Map Unit Composition

- *Sorrento and similar soils:* 85 percent
- *Minor components:* 15 percent
- *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Sorrento

Setting

- *Landform:* Alluvial fans
- *Landform position (two-dimensional):* Toeslope
- *Landform position (three-dimensional):* Base slope

- *Down-slope shape:* Linear
- *Across-slope shape:* Linear
- *Parent material:* Alluvium derived from sedimentary rock

Typical profile

- *A - 0 to 12 inches:* loam
- *AB - 12 to 37 inches:* silty clay loam
- *Bk - 37 to 62 inches:* silty clay loam
- *2C - 62 to 72 inches:* sandy loam

Properties and qualities

- *Slope:* 2 to 9 percent
- *Depth to restrictive feature:* More than 80 inches
- *Natural drainage class:* Well drained
- *Runoff class:* Medium
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately high (0.20 to 0.60 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Calcium carbonate, maximum in profile:* 5 percent
- *Salinity, maximum in profile:* Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
- *Available water storage in profile:* High (about 11.6 inches)

Interpretive groups

LITERATURE REVIEW DETAILS – BASIN PLAN BENEFICIAL USES

BASIN PLAN BENEFICIAL USES

Beneficial uses are defined in the Porter-Cologne Act as those uses of water that are necessary for tangible and intangible economic, social, and environmental benefits. The *Water Quality Control Plan: Santa Ana River Basin (8)* (Basin Plan) identifies a number of beneficial uses for Reach 1 of Santiago Creek and Irvine Lake: Municipal and Domestic Water Supply (MUN) waters, Agricultural Supply (AGR) waters, Groundwater Recharge (GRW) waters, Water Contact Recreation (REC-1) waters, Non-contact Water Recreation (REC-2) waters, Warm Fresh Water Habitat (WARM) waters, Cold Freshwater Habitat (COLD) waters, and Wildlife Habitat (WILD) waters (Santa Ana RWQCB 1995).

- MUN waters support community, military, or individual water supply systems including, but not limited to, drinking water supply.
- AGR waters are used for farming, horticulture, or ranching. These uses may include, but are not limited to, irrigation, stock watering, and support of vegetation for range grazing.
- GRW waters are used for natural or artificial recharge of groundwater for purposes that may include, but are not limited to, future extraction, maintaining water quality, or halting saltwater intrusion into freshwater aquifers.
- REC-1 waters are used for recreational activities involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, white water activities, fishing, or use of natural hot springs.
- REC-2 waters are used for recreational activities involving proximity to water but not normally involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing, or aesthetic enjoyment in conjunction with the above activities.
- WARM waters support warm water ecosystems that may include, but are not limited to, preservation and enhancement of aquatic habitats, vegetation, fish, and wildlife (including invertebrates).
- COLD waters support cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife (including invertebrates).
- WILD waters support wildlife habitats that may include, but are not limited to, the preservation and enhancement of vegetation and prey species used by waterfowl and other wildlife

[a] Portions of the Permanent and Temporary impact boundaries overlap the "Additional Inundation Area". The overlap with the permanent impact is being excluded since the vegetation would no longer be present after implementation of the Project. However, the overlap with the temporary impact is not being excluded because it is assumed these areas will be revegetated following the Project and the Additional Inundation Area represents a long-term, periodic change in maximum lake level.

EXECUTIVE/MANAGEMENT SUMMARY

PURPOSE AND SCOPE

The purpose of this Historic Property Identification Report (Archaeological Resources) and Paleontological Resources Study (report) is to determine the potential for impacts to archaeological and paleontological resources within the proposed Santiago Creek Dam Outlet and Spillway Project (hereinafter referred to as "the Project"), located in Orange County, California. In addition to compliance with the California Environmental Quality Act (CEQA), the Project requires a technical study that will allow for federal funding by the State Water Board. Therefore, this report has been prepared for compliance with Section 15064.5 of the CEQA Guidelines and to satisfy Section 106 of the National Historic Preservation Act (NHPA), with respect to the identification and preservation of cultural resources (i.e., archaeological sites). According to the *Code of Federal Regulations* (CFR, Title 40, Section 1506.4, Combining documents), "Any environmental document in compliance with NEPA (National Environmental Policy Act) may be combined with any other agency documents to reduce duplication and paperwork". Therefore, the format of this report follows an amended version of the Office of Historic Preservation's *Archaeological Resource Management Reports (ARMR): Recommended Contents and Format* (Office of Historic Preservation 1990) to meet both CEQA and NEPA requirements.

DATES OF INVESTIGATION

Psomas requested the cultural resources literature and records search for the Project from the South-Central Coastal Information Center (SCCIC) at the California State University, Fullerton on September 11, 2020. On May 23, 2022, Psomas requested an additional records search, including spatial data (shapefiles) for all precontact (before arrival of Europeans) archaeological resources within a 1-mile search radius from the proposed Project Area of Potential Effects (APE).

On September11, 2020, Psomas requested that the Native American Heritage Commission (NAHC) conduct a search of its Sacred Lands File (SLF) to determine if cultural resources important to Native Americans have been recorded within the Project APE or in the immediate vicinity of the Project APE.

On October 15, 2020, Psomas requested that the Natural History Museum (NHM) of Los Angeles County conduct a search of its paleontology collection records for the locality and specimen data for the Project APE and surrounding area.

A pedestrian survey of the Project APE was conducted on October 20, 2020. This 1st draft report was completed in August 2023 and is based on the findings from the SCCIC, NAHC, Native American outreach and consultation, and the pedestrian survey of the Project APE. As a subconsultant to Psomas, South Environmental completed an architectural history and built environment study of the Santiago Dam under separate cover and is included as Attachment E. This technical report addresses only the archaeological and paleontological resources identified within the Project APE and the 1.6 km (1-mile) search radius surrounding the Project APE.

FINDINGS OF THE INVESTIGATION

Psomas conducted archaeological resources field investigations within the proposed Project APE on October 20, 2020. The main goal of the investigations was to gather and analyze information needed to determine if the Project would have a significant impact on properties eligible for the National Register of Historic Places (NRHP) and the California Register of Historic Places (CRHR) and to provide mitigation measures for those resources. The results of the 2021 SCCIC cultural resources records searches identified 18 previously recorded cultural resources within 1.6

kilometers (km) (1 mile) of the Project site. The previously recorded resources include two precontact isolates (ground stone), 12 precontact sites, three historic sites/built environments, and one multicomponent site. The precontact sites consist of rock shelters, lithic scatters (stone debris left over from making stone tools), hearths (roasting pits/remnants of campfires), cairns (rock features), bedrock milling features (ground stone technology), habitation debris (midden), and burials. The historic sites consist of roads/trails, single family residences, standing structures, wells/cisterns, water conveyance systems, and a standing engineering structure (dam). Of the 18 cultural resources, two (P-30-001012 and P-30176757) were identified within the Project APE. Cultural resource P-30-001012 is described as a precontact lithic scatter and cultural resource P-30-17657 is the Santiago Dam (see Attachment E). Furthermore, the NAHC SLF search was positive for sacred sites.

The NHM record search included a thorough search of the NHM paleontology collection records for the locality and specimen data for the Project APE and surrounding area. The records search identified fossil localities that lie directly within the proposed Project APE as well as numerous fossil localities nearby from the same sedimentary deposits that occur in the proposed Project area, either at the surface or at depth. One locality, LACM IP 26171, is located along the northwest shore of Santiago Reservoir, where unspecified invertebrates were collected from the Williams Formation during excavations for the spillway in 1969 (depth of fossils is not known). Additionally, eight localities were located nearby from the same sedimentary deposits that occurs in the Project site, either at the surface or at depth below the surface.

Fieldwork (archaeological and paleontological survey) relocated P-30-001012; however, none of the cultural resources recorded by W. H. Bryce 1982 were observed on the surface; though, MBA noted in 2004 the artifact assemblage and site boundary for P-30-001012 were not relocated due to the site being stripped for agricultural practices and scattered debris piled placed along a nearby small drainage. No new archaeological resources and/or paleontological resources were identified within the Project APE. Nevertheless, it should be noted that both the Project APE and the surrounding area should be considered highly sensitive for archaeological resources dating to both the precontact period and the historic era and paleontological resources.

DISPOSITION OF DATA

This report will be filed with the Psomas and the SCCIC. All field notes and other documentation related to the report are on file at Psomas.

1.0 INTRODUCTION

1.1 PROJECT LOCATION

The Project is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California. Santiago Creek Dam impounds Irvine Lake. It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. More specifically, the Project APE is located on the Blackstar 7.5-minute United States Geological Survey (USGS) topographic quadrangle within Township 04; 05 South, Range 08 West, and Sections 33, 34, 35, 02, 03, and 04 of the San Bernardino Base and Meridian (Exhibit 1 and Exhibit 2).

1.2 PROJECT BACKGROUND AND PROJECT DESCRIPTION

1.2.1 Project Background

Irvine Ranch Water District (IRWD) and Serrano Water District (SWD), jointly referred to as the Districts, operate Irvine Lake and the Santiago Creek Dam that serves as a critical water supply reservoir for significant portions of Villa Park in Orange County, California and impounds water for Irvine Lake on Santiago Creek, a tributary to the Santa Ana River. Santiago Creek Dam is a compacted earth-fill embankment completed in 1933 and certified by the State of California, Department of Water Resources (DWR), Division of Safety of Dams (DSOD), which identifies it as Dam No. 75-000.

The Districts have been working with the DSOD to evaluate different structural elements of the existing Santiago Creek Dam, including the evaluation of the existing outlet tower and an alternative analysis for seismic retrofits or replacements of the tower. DSOD requested the Districts perform a seismic evaluation of the outlet tower; evaluation of the results shows that the tower is inadequate under some failure modes in a maximum credible earthquake. The existing outlet tower could potentially fail during the design seismic event, which could block the existing outlet conduit with pieces of the concrete tower and/or with reservoir silt. In addition, DSOD also requested a spillway condition assessment be performed for the spillway at Santiago Creek Dam. The assessment found that the aging spillway is nearing the end of its useful life and the design did not meet current standards.

In light of the findings from the seismic evaluation for the existing outlet tower and comprehensive assessment of the existing spillway, the Districts have elected to develop designs for an inclined outlet structure that would be placed near the left abutment of the existing dam and replacement of the existing spillway with a side-channel spillway on the left abutment. The spillway crest would be raised by six feet to provide more operation capacity in the reservoir for the Districts. The existing outlet tower would be abandoned, and the new inclined outlet structure would connect to the existing outlet conduit within the reservoir.

The rehabilitation and replacement of the Santiago Creek Dam outlet works, and spillway facilities is necessary to address identified seismic safety concerns; to meet current DSOD regulatory requirements; to satisfy the Districts' operational requirements; to extend the useful life of the facilities; and to improve reliability.

Irvine Lake is held at varying levels depending on the time of year. In the wet winter months, water can be stored up to the 791.9-foot elevational contour. The height of the existing spillway with the flashboards installed is at the 795.9-foot elevation contour; this is the current maximum capacity of the reservoir and is only permitted in the summer months. Historically, the inflow into the reservoir during storm events is high enough to cause the water to flow over the spillway crest, located at the 791.9-foot elevation, approximately once every four to five years (1937 to 2019).

From October 2002 to September 2020, the reservoir has been filled to the spillway crest a total of four times and water has been high enough to flow over the spillway twice. The water levels in the lake during this period (2002 to 2020) fluctuated between approximately 736 feet elevation contour to 795 feet elevation contour. Between 2002 and 2020, the longest consecutive period that water was stored in the upper 2 feet of the reservoir (793.9 to 795.9 feet) was approximately 35 days.

1.2.2 Project Description

General elements of each portion of the Project are included below. A more detailed description of the proposed facilities is included in the Environmental Impact Report (EIR).

- The existing outlet tower would be demolished; the portion below the sediment would be filled with concrete and capped with a concrete plug. A new inclined outlet structure would be constructed on the left abutment. Each riser would include an intake fish screen.
- The inlet/outlet works would be configured to incorporate the new structure, including new valves and fittings. Water from the lake would enter the new inclined inlet/outlet structure and would convey lake water through an existing conduit under the dam. At the downstream toe of the dam, a new fitting would be installed to bifurcate the flow to the Irvine Lake Pipeline (ILP) or the emergency outlet pipeline. Water that enters the ILP would reach the Districts' distribution systems. Water that enters the emergency outlet pipeline would be released at the end of the new spillway.
- The ILP would be increased from 36 inches to 54 inches to match the pipeline coming from the inclined inlet/outlet structure, as well as to increase the capacity of the line to improve the hydraulic performance of the system.
- The existing spillway would be demolished and replaced with a new side-channel spillway in a rock cut on the left abutment.
- A new access road and ramp would be constructed to provide vehicle access to the new inlet/outlet structure. A new retaining wall would be needed to cut the roadway into the existing slope without affecting the existing landfill facility above.
- A new dam control building would be constructed to house the valve system at the end of the existing dam crest. The preliminary layout shows a fire-hardened building with dimensions 52 feet by 18 feet and a height of 12 feet.
- The dam crest would be widened from 10 feet to 12 feet with a retaining wall on the downstream side of the crest. The retaining wall would be 1,300 feet in length and would have a height of 10 feet.
- The dam crest would be raised with an approximately 1.5-foot-tall concrete parapet wall on the upstream side of the dam crest.
- A new emergency access walkway (5 feet wide) and stair system would be constructed along the left wall of the new spillway channel to reach the inlet/outlet structure and dam crest from the adjacent landfill during a spillway event. The walkway would connect to the new access road (described above).
- A new steel bridge structure would be included for vehicles across the new spillway.
- Existing structures would be demolished, including the existing outlet tower, portions of the existing spillway, portions of the upstream dam embankment concrete facing, storage building on the dam crest, portions of the outlet work, portions of the ILP, catwalk/stairs across Santiago Creek, and piezometers/monitoring wells.

- The existing Southern California Edison (SCE) overhead power lines and power poles in the vicinity would be relocated outside the construction limits. This relocation would be completed by SCE.
- When construction is occurring, the lake would be dewatered and an access road would be located along the edge of the dewatered lakebed to allow construction access between the staging area and the dam structure.

1.3 PROJECT PERSONNEL

The staff members for the proposed Project were selected based on their familiarity with the site's geographic location and understanding of the archaeology and paleontology discipline. The team includes experts with experience in California archaeology (precontact and historic era), paleontology, cultural resources management, project administration, and other appropriate skills including spatial analysis. Key personnel are Registered Professional Archaeologists (RPA) who meet or exceed the Secretary of the Interior's Professional Qualification Standards (NPS 1994) for archaeology. Project roles and responsibilities are summarized below.

1.3.1 Charles Cisneros, M.S., RPA

Charles Cisneros is a Registered Professional Archaeologist and served as the Project's Principal Investigator. Mr. Cisneros supervised all aspects of the archaeological Project, including the field survey and the preparation of this report.

1.3.2 Daniella Balassa, M.S.

Daniella Balassa was responsible for contributing to the geological and paleontological history and analysis section of this report.

2.0 REGULATORY SETTING

2.1 CULTURAL RESOURCES

Cultural resource laws, regulations, and guidelines set up the processes for defining what is or is not a significant cultural resource and include various agency procedures for managing these archaeological and historical resources and assessing the information from the cultural remains to determine their significance. Most importantly is whether these resources are eligible for inclusion in a national or State register (i.e., NRHP and CRHR). As defined by archaeologists Thomas Neumann and Robert Sanford (2001: 27), the laws and regulations serve to do the following:

- Set forth the criteria for assessing the relative importance of cultural remains;
- Outline the procedures for reviewing assessments;
- Delineate the responsible parties involved in making such assessments;
- Identify and then define the extent of jurisdiction and responsibility of each party in the evaluation process;
- Set forth the criteria for making a determination of significance, as well as indicating which party can or cannot make such determinations;
- Set forth the criteria for the archaeological and historic preservation work performed; and
- Set forth the criteria regarding who can perform the archaeological and historic preservation work.

A summary of both federal and State laws, regulations, and standards that govern cultural resource management within the Project's APE is provided below.

2.1.1 Federal Regulatory Setting

Section 106 of the National Historic Preservation Act

Section 106 of the NHPA of 1966, as amended, is required by the Advisory Council on Historic Preservation, with regulations contained in 36 CFR Part 800. Section 106 requires that federal agencies consider the effects of proposed projects on historic properties as part of the environmental assessment process, and it defines "historic properties" as follows (36 CFR Part 800, Protection of Historic Properties; Section 800.16[l][1], Definitions):

> Any Precontact or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria.

According to 36 CFR 60.4, a resource may be considered *historically significant* if it retains integrity and meets at least one of the following criteria. A property may be eligible for the NRHP if the resource:

A. is associated with events that have made a significant contribution to the broad patterns of our history;

B. is associated with the lives of persons significant in our past;

C. embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; or

D. has yielded, or may be likely to yield, information important in prehistory or history.

For a property to be listed in the NRHP, it must meet one or more of the criteria of significance, and it must also retain integrity. The National Park Service's (1995a) *How to Apply the National Register Criteria* recognizes seven aspects or qualities that, in various combinations, define integrity. The seven aspects of integrity are described below:

- **Location:** Location is the place where the historic property was constructed or the place where the historic event occurred.
- **Design:** Design is the combination of elements that create the form, plan, space, structure, and style of a property.
- **Setting:** Setting is the physical environment of a historic property.
- **Materials:** Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- **Workmanship:** Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- **Feeling:** Feeling is a property's expression of the aesthetic or historic sense of a particular period of time.
- **Association:** Association is the direct link between an important historic event or person and a historic property.

The steps in evaluating integrity are further described by the National Park Service (1995):

- Define the essential physical features that must be present for a property to represent its significance;
- Determine whether the essential physical features are visible enough to convey their significance;
- Determine whether the property needs to be compared with similar properties; and
- Determine, based on the significance and essential physical features, which aspects of integrity are particularly vital to the property being nominated and if they are present.

Native American Graves and Repatriation Act

The Native American Graves and Repatriation Act (NAGPRA) established a means for Native Americans, including Indian Tribes, to request the return of human remains and other sensitive cultural items held by federal agencies or federally assisted museums or institutions. NAGPRA also contains provisions regarding the intentional excavation and removal of, inadvertent discovery of, and illegal trafficking in Native American human remains and sensitive cultural items.

2.1.2 State Regulatory Setting

California Register of Historical Resources

The CEQA requires a lead agency to determine whether a project would have a significant effect on one or more historical resources. According to Section 15064.5(a) of the State CEQA

Guidelines, a "historical resource" is defined as a resource listed in or determined to be eligible for listing in the CRHR (*California Public Resources Code* [PRC] Section 21084.1); a resource included in a local register of historical resources (*California Code of Regulations* [CCR], Title 14, Section 15064.5[a][2]); or any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant (14 CCR 15064.5[a][3]).

Section 5024.1 of the PRC, Section 15064.5 of the State CEQA Guidelines (CCR, Title 14, Chapter 3, Sections 15000–15387), and Sections 21083.2 and 21084.1 of the CEQA (PRC, Sections 21000–21189) were used as the basic guidelines for the cultural resources study. PRC Section 5024.1 requires an evaluation of historical resources to determine their eligibility for listing in the CRHR. The purpose of the CRHR is to maintain listings of the State's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources in the CRHR, which were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP (per the criteria listed at 36 CFR 60.4), are stated below.

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and that:

(1) Are associated with events that have made a significant contribution to the broad patterns of our history; or

(2) Are associated with the lives of persons significant in our past; or

(3) Embody the distinctive characteristics of a type, period, or method of installation, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

(4) Have yielded, or may be likely to yield, information important in prehistory or history.

According to Section 15064.5(a)(3) (A–D) of the State CEQA Guidelines, a resource is considered historically significant if it meets the criteria for listing in the NRHP, as stated above, in addition to the CRHR. Impacts that affect those characteristics of the resource, that qualify it for the NRHP or that would adversely alter the significance of a resource listed in or eligible for listing in the CRHR, are considered to have a significant effect on the environment. Impacts to cultural resources from the proposed Project are thus considered significant if the Project: (1) physically destroys or damages all or part of a resource; (2) changes the character of the use of the resource or physical feature within the setting of the resource that contributes to its significance; or (3) introduces visual, atmospheric, or audible elements that diminish the integrity of significant features of the resource.

The purpose of a cultural resources' investigation is to evaluate whether any cultural resources remain exposed on the surface of a project site or can reasonably be expected to exist in the subsurface. If resources are discovered, management recommendations would be required for evaluation of the resources for CRHR eligibility.

Assembly Bill 52

Assembly Bill (AB) 52 (Chapter 532, Statutes of 2014), which became effective on July 1, 2015, requires lead agencies to provide notice to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project, if they have requested such notice in writing. Once Native American tribes receive a project notification, they have 30 days to respond as to whether

they wish to initiate consultation regarding the project, including subjects such as mitigation for any potential project impacts to tribal cultural resources (TCR). A TCR is defined as either a site, feature, place, or cultural landscape that is geographically defined in terms of size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is eligible for the CRHR or a local historic register. If a tribe requests consultation and the lead agency and the tribe ultimately agree on mitigation to address any potentially significant impacts to TCRs, the mitigation measures agreed upon during consultation must be recommended for inclusion in the environmental document.

2.1.3 Human Remains

Section 7050.5 of the *California Health and Safety Code* provides for the disposition of accidentally discovered human remains. Section 7050.5 states that, if human remains are found, no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains would occur until the County Coroner has determined the appropriate treatment and disposition of the human remains.

Section 5097.98 of the PRC states that, if remains are determined by the Coroner to be of Native American origin, the Coroner must notify the NAHC within 24 hours. The NAHC, in turn, must identify the person or persons it believes to be the most likely descendant of the deceased Native American. The descendant shall complete their inspection within 48 hours of being granted access to the site. The designated Native American representative would then determine, in consultation with the property owner, the disposition of the human remains.

2.1.4 Paleontological Resources

Paleontological resources are afforded protection by environmental legislation set forth under CEQA. Appendix G of the CEQA Guidelines provides guidance relative to significant impacts on paleontological resources, indicating that a project will have a significant impact on paleontological resources if it disturbs or destroys a unique paleontological resource or site or unique geological feature.

Under Guidelines for the Implementation of CEQA, as amended on March 29, 1999 (Title 14, Division 6, Chapter 3, California Code of Regulations: 15000 et seq.), procedures define types of activities, persons, and public agencies required to comply with CEQA and include as one of the questions to be answered in the Environmental Checklist: “Will the proposed project disturb paleontological resources?” (Appendix G, Section VII, Part f)

The California Public Resources Code Section 5097.5 states:

a) “No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or Precontact ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.

b) As used in this section, “public lands” means lands owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or any agency thereof.”

3.0 SETTING

3.1 CONTEMPORARY SETTING

The Project site is located on the USGS' Black Star Canyon 7.5-minute quadrangle. It is within the Santa Ana Watershed. The drainage area for the Project encompasses approximately 63.4 square miles. Irvine Lake (also called the Santiago Creek Reservoir) was originally constructed in 1933 to store water for the benefit of the surrounding communities.

3.1.1 Embankment Dam

The Santiago Creek Dam is a compacted earthfill embankment completed in 1933 that is under the jurisdiction of the State of California, DWR, and DSOD. Santiago Creek Dam allows IRWD to impound water within Irvine Lake, a critical water supply reservoir for IRWD and SWD. The reservoir provides flood control, water supply, fisheries enhancement, and recreational opportunities for the surrounding area. The existing silt level within the lake varies throughout the lake; however, it is estimated that the accumulated sediment occupies approximately 2,150 acre-feet of the lake to date.

3.1.2 Outlet Works

The outlet works for the dam consists of a tower, an outlet conduit, and downstream control house. A concrete-encased welded steel pipe outlet conduit is located at the base of the outlet tower and runs beneath the dam to the toe of the dam where a bifurcation splits the flow into a main pipe and diverter pipe. The main pipe supplies water to IRWD and SWD.

3.1.3 Spillway

The existing spillway is a reinforced concrete structure located on the left abutment of the dam and consists of an approach, control structure, chute, and flip bucket at the downstream end. The spillway has vertical reinforced concrete walls through the length and a bridge structure with piers at the spillway crest. The spillway crest elevation is located at elevation 791.9 feet. Historical records of spillway flows at Santiago Creek Dam indicate that the spillway has flowed 24 times between 1937 and 2019 (82 years). The downstream end of the spillway was extensively modified in 1969 and 1970 after sustaining significant damage during a February 1969 flood event. The damaged waste channel and spillway chute were removed, and a new flip bucket was constructed at the end of the existing spillway chute. Surrounding land uses primarily consist of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake. Residential development is located west of SR-241.

Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the Project area in the northwest, downstream of the Dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the Project area. Elevations in the Project area range from approximately 657 to 996 feet above mean sea level.

3.2 BASIN PHYSIOLOGY AND ENVIRONMENT

3.2.1 Basin Physiology

The Project APE is located on the western slope of the Santa Ana Mountains in southern California. Santiago Creek is within the APE and flows in a northwesterly direction for about 32 miles from its headwaters near Santiago Peak to its confluence with the Santa Ana River about 14.5 miles downstream of Santiago Creek Dam. Santiago Creek Dam drains about 63 square miles of the Santiago Creek watershed. The drainage basin upstream of the dam generally consists of steep and mountainous terrain, ranging in elevation from approximately 780 feet at the dam to 5,680 feet in the headwaters near Santiago Peak. Urban development and agricultural use within the watershed are limited, with much of the drainage basin located in the Cleveland National Forest. Vegetation within the basin generally consists of scrub/rangeland with areas of dense shrubs and trees. Most of the basin soils fall into Natural Resources Conservation Service (NRCS) hydrologic group D, indicating a poor infiltration rate and high runoff potential when thoroughly wet, though there are pockets of more well-drained soils.

The climate of the basin is characterized by hot, dry summers and mild, wet winters, with over 80 percent of annual precipitation falling between November and March. The Santiago Creek Dam watershed receives a 30-year mean annual precipitation of approximately 22 inches, ranging from approximately 14 inches at lower elevations to over 29 inches in the basin headwaters. Due to the basin's relatively low elevations and mild climate, precipitation within the basin generally falls as rain.

3.2.2 Environmental Setting

The Project APE is in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan. The following vegetation types occur in the Project APE: sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland, southern sycamore-coast live oak riparian woodland, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, and western sycamore, and vegetated fluctuating shoreline. Many of these vegetation types would have been utilized by the first Californians, the ancestors of today's local Native American communities.

Other landcover includes cliff, open water, fluctuating shoreline, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

3.3 REGIONAL GEOLOGY

Principal sources of existing information for this subsection included geologic maps and reports on the regional geology published by the U.S. Geological Survey (Schoellhamer et al. 1981; Morton and Miller 1981; Morton and Miller 2006) and unpublished reports, drawings, and photographs related to site-specific studies and construction of Santiago Creek Dam (Kempkey 1930; Marliave 1939). Review of these geologic publications and unpublished project reports provided a framework of the subsurface geologic conditions at the Project site, which served as the basis for preparation of the geotechnical investigation work plan and subsurface exploration program discussed in the Project's Environmental Impact Report (EIR) and this technical study.

As discussed above, Santiago Creek Dam is on Santiago Creek, which is a major north-flowing drainage in the Northern Santa Ana Mountains. Geologic mapping by Schoellhamer et al. (1981) and other subsequent geologic maps (e.g., Morton and Miller 1981; Morton and Miller 2006),

show the Project APE to be underlain by Cretaceous to Eocene sedimentary rock, which is locally overlain by Pleistocene to Holocene age alluvium. Bedrock in the vicinity of the outlet tower and spillway consists of marine sediments of the Williams Formation (Schoellhamer et al. 1981; WCC 1979). The Williams Formation is subdivided into the Schulz Ranch Sandstone Member and the Pleasants Sandstone Member. The Schulz Ranch Member, which is the stratigraphically lower member of the Williams Formation, is typically a brownish yellow to gray, massive coarse-grained sandstone, and conglomerate. Schoellhamer et al. (1981) also reported that portions of the Schulz Ranch Member consist of interbedded conglomeratic sandstone with siltstone beds that are about 12 to 30 feet thick. Schoellhamer et al. (1981) described the Pleasants Sandstone Member as a light brown to gray, fine-grained sandstone (Schoelhammer et al. 1981). The contact between the two members is mapped in the vicinity of the spillway.

Although the published literature (Schoellhamer 1954, 1981) describes the Williams Formation as predominantly consisting of sandstone, Marliave (1939) and WCC (1979) mapped much of the Williams Formation in the left abutment and spillway area as shale. Marliave (1939) mapped much of the spillway excavation and the entire length of the trench for the outlet pipe, and his mapping indicates a predominance of shale. Shale also was encountered in a diamond drill hole (Drill Hole No. 9) about 50 feet south of the outlet tower that was done as part of the original dam explorations (Kempkey 1930). The log of the borehole suggests that the top of the brown shale bedrock was at an elevation of approximately 672 feet. Based on the mapping and outlet trench log by Marliave (1939), the orientation of the bedrock in the vicinity of the spillway and outlet tower typically strikes northwest and dips approximately 50 to 75 degrees toward the southwest.

3.4 PRECONTACT SETTING

Southern California has a long history of human occupation, with dates of the earliest evidence of human occupation during the late Pleistocene, circa (ca.) 11,000 years B.C. (Glassow et al. 2007: 191). Precontact material culture in the State's southern region has been categorized according to periods or patterns that define technological, economic, social, and ideological elements. Within these periods, archaeologists have defined cultural patterns or complexes specific to prehistory within the State's southern region, including the Project site.

The following text and table (Table 1) illustrates the chronological framework developed for Southern California. This framework is divided into four major periods: Paleoindian period (ca. 11,000–7000 B.C.), Milling Stone period (7000 B.C.–3000 B.C.), Intermediate period (3000 B.C.–A.D. 500), and Late Precontact period (A.D. 500–Historic Contact). Within these broad temporal periods are variations in the timing and nomenclature of cultural complexes for the region. The timescales referenced in the following discussion are presented as calendar dates (years B.C.–A.D.).

TABLE 1
CULTURAL CHRONOLOGY FOR SOUTHERN CALIFORNIA

Period	Cultural Traits	Years (B.C.–A.D.)
Paleoindian	Clovis and Folsom Fluted Projectile Points	11,000 B.C.–7000 B.C.
Milling Stone	Ground Stone Implements; Large Leaf-Shaped Projectile Points	7000 B.C.–3000 B.C.
Intermediate	Large Side-Notched, Stemmed, and Leaf-Shaped Projectile Points; Mortar and Pestle	3000 B.C.–A.D. 500
Late Precontact	Smaller Projectile Points with Convex or Concave Bases, Bow and Arrow; Increased Population Size	A.D. 500 –1769

3.4.1 Paleoindian Period (11,000–7000 B.C.)

Recent data from coastal and inland sites during this period indicate that the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas and on Pleistocene lakeshores (Moratto 1984:90–92). Although few Clovis-like or Folsom-like fluted points have been found in Southern California, it is widely thought that there was a greater emphasis on hunting at near-coastal and inland sites during the Paleoindian Period than in later periods (e.g., Dillon 2002; Erlandson et al. 1987). Subsistence patterns shifted around 6000 B.C., concurrent with the gradual desiccation associated with the onset of the Altithermal, a warm and dry period that lasted for about 3,000 years. As the climate changed, a greater emphasis was placed on plant foods and small animals.

3.4.2 Milling Stone Period (7000–3000 B.C.)

The Milling Stone Period (Wallace 1955, 1978) is the earliest well-established period of occupation in Southern California (Glassow et al. 2007: 192). This period is characterized by an ecological adaptation to collecting, accompanied by a dependence on ground stone implements associated with the horizontal motion of grinding small seeds: milling stones (metates, slabs) and hand stones (manos, mullers). Milling stones are found in large numbers for the first time and become more numerous toward the end of this period. As evidenced by their tool kits and shell middens in coastal sites, people during this period practiced a mixed food-procurement strategy. Subsistence patterns became more specialized as groups became better adapted to their regional or local environments. Projectile points from the period are relatively rare, but are large and generally leaf-shaped, and were probably employed with darts or spears thrown with atlatls. Bone tools, such as awls, and items made from shell, including beads, pendants, and abalone dishes, are also quite uncommon. Evidence of weaving or basketry is present at a few sites. The mortar and pestle, associated with the vertical motion of pounding foods such as acorns, were introduced during the Milling Stone Period but do not become common until the Intermediate Period.

3.4.3 Intermediate Period (3000 B.C.–A.D. 500)

The Intermediate Period is characterized by a shift toward a hunting and maritime subsistence strategy, along with a wider use of plant foods. During this period, a pronounced trend toward greater adaptation to regional or local resources can be observed. For example, the remains of fish, land mammals, and marine mammals are increasingly abundant and diverse in sites along the Southern California coast. Chipped stone tools suitable for hunting are more common and both stylistically and technologically varied. Projectile points include large side-notched, stemmed, and lanceolate or leaf-shaped forms. Larger knives, a variety of stone flake scrapers, and drill-like implements are also common during this period. Shell fishhooks become an integral part of the tool kit. Bone tools, including awls, are more numerous than in the preceding period; and the use of asphaltum adhesive becomes more common.

3.4.4 Late Precontact Period (A.D. 500–1769)

During the Late Precontact Period, use of plant food resources increased in conjunction with land and marine mammal hunting. The variety and complexity of material culture also increased during this period, demonstrated by more diverse classes of artifacts. The recovery of many small, finely chipped projectile points, usually stemless with convex or concave bases, suggests an increased utilization of the bow and arrow for hunting rather than the atlatl and dart.

During this period, an increase in population size is accompanied by the advent of larger, more permanent villages with greater numbers of inhabitants (Wallace 1955:223). Some coastal and near coastal settlements were occupied by as many as 1,500 people. Many of these larger

settlements were permanent villages where at least some people resided year-round. The populations of these villages may have also increased seasonally.

3.5 POST CONTACT HISTORY

Prior to European exploration and colonization efforts in the 18th century, Orange County and the Santiago Canyon was home to Juaneño and Gabrielino Native American communities. The earliest European colonizers traveled through Orange County as part of Don Gaspar de Portolá's overland expedition into Alta California. The Portola expedition camped in what is now Santiago Canyon in July of 1769 and again in January of 1770 when missionary Juan Crespi noted the location of the Santiago Creek and that the missionaries had named it Santiago after the patron Saint of Spain. In 1797, Father Junipero Serra founded Mission San Gabriel in present day Los Angeles and Mission San Juan Capistrano in 1776. Between these two missions, the majority of Orange County was under mission control and used primarily as grazing lands. In 1821, Mexico gained independence from Spain and in 1833 the Mexican government moved to secularize former mission lands and granted them to Mexican citizens. Teodocio Yorba, the youngest son of Jose Antonio Yorba who was one of the largest landowners in orange County, received the Rancho Lomas de Santiago land grant in 1846. Teodocio established his ranch headquarters at the present site of Irvine Lake.

With the signing of the Treaty of Guadalupe Hidalgo in 1848, Alta California was ceded to the United States and California became a U.S. Territory. The Congressional Act of 1851 forced landholders to reapply to the Board of Land Commissioners to get valid title to their ranchos. Yorba was able to retain his claim to Rancho Lomas de Santiago and sold the rancho to William Wolfskill in 1860. After suffering financial misfortune as a result of the drought of 1863–1864, Wolfskill sold the rancho to Llewellyn Bixby, Thomas and Benjamin Flint, and James Irvine in 1866. Bixby, the Flints, and Irvine had also purchased other large sections of rancho land, but the acquisition of Rancho Lomas de Santiago was important to securing water rights in the region. In 1877, James Irvine acquired his partner's shares in the various ranchos they had purchased together becoming sole owner of over 110,000 acres of land that stretched 23 miles from the Pacific Ocean to the Santa Ana River.

3.5.1 Santiago Dam

Unless otherwise noted, the following information regarding the Santiago Dam was excerpted from the DPR 523 Series Forms for P-30-176757 (Santiago Dam) prepared by Cary D. Cotterman of Chambers Group, Inc.

For most of the late 19th and early 20th centuries, the land around the present site of Santiago Dam was used for cattle and sheep grazing, as well as recreation. The Serrano Irrigation District (known today as the SWD) provided water for the earliest citrus groves in the Orange and Villa Park areas, beginning in 1876. By the late 1920's, the demand for irrigation water had increased to the point that a large storage reservoir was needed. In response to this demand, the Serrano Irrigation District and the John T. Carpenter Water Company of Villa Park undertook a joint project in 1930, selling bond issues worth $400,000 to finance half of the dam's construction. The Irvine Company, which owned the land, matched that amount, for a total of $800,000. By October of 1930, engineer A. Kempkey of San Francisco, assisted by Irvine Company engineer Roy Browning, was making exploratory drillings into the bedrock at the proposed dam site on Santiago Creek prior to drawing the construction blueprints. Santiago Dam was constructed, creating Santiago Reservoir (now called Irvine Lake), during 1931. Although the dam was designed by Kempkey, the on-site supervising engineer was Wess Albert, and the construction contractor was R.G. Tourneau. The dam was completed in December 1931, and the reservoir was first completely filled, with water running over the spillway at its west end, in 1937. In 1934, a dam keeper's residence was constructed on a hillside overlooking the east end of the dam. The water

provided by the creation of the dam and reservoir contributed significantly to the early and mid-20th century development of the citrus industry in Orange County, one of the leading citrus-producing regions of the U.S. at that time. The facility was originally intended only for irrigation water storage but was opened for recreational use in 1941. Today, the IRWD still distributes untreated water from the reservoir for irrigation, while the SWD supplies treated drinking water to Villa Park and portions of Orange and operates Irvine Lake's recreational concessions.

4.0 METHODS

4.1 CULTURAL RESOURCES

4.1.1 Cultural Resource Records Search and Literature Review

An archaeological resources records search was conducted by Psomas at the South-Central Coastal Information Center (SCCIC) at California State University, Fullerton on September 21, 2021, and provided to PaleoWest. The SCCIC is the designated branch of the California Historical Resources Information System (CHRIS) for the Project area and houses records concerning archaeological and historic resources in Los Angeles, Ventura, San Bernardino, and Orange Counties. The review consisted of an examination of the USGS Black Star Canyon 7.5-minute quadrangle to evaluate the Project area for any sites recorded or cultural resources studies conducted on the parcel and within a one-mile radius. Data sources consulted at the SCCIC include the Historic Property Data File maintained by the California Office of Historic Preservation, archaeological records, Archaeological Determinations of Eligibility, Historical Landmarks, and historic maps. The records were reviewed to accomplish the following:

- Identify cultural resources (e.g., archaeological sites) in the Project site and surrounding areas;
- Identify and determine the adequacy of previous cultural resources studies in the Project site;
- Develop management recommendations for cultural resources within or adjacent to the Project site; and
- Assess what additional cultural resources studies would need to be undertaken for the proposed Project.

The results of the records searches are presented below in Subsection 5.1.

4.1.2 Native American Sacred Lands File Review

An inquiry was made of the NAHC on September 11, 2020, to request a review of the Sacred Lands File (SLF) database regarding the possibility of Native American cultural resources and/or sacred places in the Project vicinity that are not documented on other databases. The results of the SLF Review are presented below in Subsection 5.2.

4.1.3 Natural History Museum of Los Angeles County

Psomas requested a paleontological literature and records search from the Natural History Museum of Los Angeles County (NHM) on October 20, 2020. The results of the NHM search are presented below in Subsection 5.3.

4.1.4 Archaeological and Paleontological Field Survey

Psomas surveyed the Project site on October 20, 2020. The entire Project site (Figure 1) was surveyed by walking evenly spaced transects spaced no more than 10 meters (32 feet) apart. The archaeologist examined all areas considered highly sensitive for cultural resources and the ground surface for the presence of the following:

- Precontact artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools);
- Historic artifacts (e.g., metal, glass, ceramics);

- Sediment discoloration that might indicate the presence of a cultural midden;
- Depressions and other features indicative of the former presence of structures or buildings (e.g., post holes, foundations); and
- Fossil Localities.

Psomas maintained transect accuracy in the Project site using a Garmin global positioning system (GPS) receiver and Project field maps. A field notebook and a digital camera were used to record the survey conditions and findings. The results of the archaeological field survey are presented below in Subsection 5.4.

FIGURE 1: OVERVIEW OF PROJECT SITE

5.0 REPORT OF FINDINGS

5.1 SOUTH CENTRAL COASTAL INFORMATION CENTER

The SCCIC record search identified 28 prior technical cultural resources studies and academic overviews within 1.6 kilometer (km) (i.e., 1 mile) of the Project APE. Of the 28 previous investigations, 14 of these studies occurred or overlapped within the Project APE (Table 2). The studies crossed the current Project site as early as 1979 and as recently as 2007. The types of studies include academic overviews, cultural resource surveys and assessments, mitigation monitoring, and testing and evaluations. The academic overview studies are a testament to the archaeological sensitivity of region, including the Project site. The records search results summary letter from SCCIC is presented as Attachment A.

The SCCIC records searches identified 18 previously recorded cultural resources within 1.6 km (1 mile) of the Project site (Table 3). The previously recorded resources include two precontact isolates (ground stone), 12 precontact sites, three historic sites/built environments and one multicomponent site. The precontact sites consist of rock shelters, lithic scatters (stone debris left over from making stone tools), hearths (roasting pits/remnants of campfires), cairns (rock features), bedrock milling features (ground stone technology), habitation debris (midden), and burials. The historic sites consist of roads/trails, single family residences, standing structures, wells/cisterns, water conveyance systems and a standing engineering structure (dam). Of the 18 cultural resources, two (P-30-001012 and P-30176757) were identified within the Project APE. Cultural resource P-30-001012 is described as a precontact lithic scatter and cultural resource P-30-17657 is the Santiago Dam.

P-30-001012 (CA-ORA-1012)

This archaeological site was originally recorded by W. H. Bryce in 1982 as a precontact lithic scatter measuring 70 x 95 meters and consisting of debitage (debris from manufacturing stone tools) and groundstone (stone that has been pecked or ground into a specific shape). The debitage includes 16 pieces of secondary debitage comprising of 12 white chert secondary flakes and four chalcedony flakes, all described as small to medium in size. The groundstone assembly includes one piece (fragment) of a basin metate and one piece (fragment) of a shallow bowl. The metate fragment measured 19 x 19 x 7 centimeters (cm) and the stone bowl fragment measured 21 x 14 x 26 cm.

In 2004, Michael Brandman and Associates (MBA) relocated the archaeological site. None of the cultural resources (artifacts discussed above) identified by Bryce in 1982 were visible on the ground surface. However, it should be noted disturbance from agricultural activities may have displaced these resources after 1982.

Using the previous archaeological site record prepared by Bryce in 1982, MBA placed a backhoe trench 30 meters north of Santiago Canyon Road to determine if cultural resources and/or a cultural midden is located below the surface. The trench was placed northwest of the intersection of Santiago Canyon Road and Blue Diamond Road and was excavated to a depth of 2.5 meters below the surface. No cultural resources (i.e., groundstone, projectile points) were recovered from the excavations. Furthermore, no stratigraphic evidence for cultural middens (habitation debris) was observed in the trench. MBA also described the first 80 cm below the surface as a plow zone (top layer of soil through which a plow penetrates).

MBA evaluated the archaeological site in accordance with CEQA, using criteria outlined for the CRHR eligibility. MBA's conclusion was the site does not qualify for the CRHR and is not a unique archaeological resource for the purposes of CEQA. MBA also concluded it is unlikely that any of the characteristics from the site described by Bryce will be impacted should modifications to the road be necessary at a future date; however, MBA also concluded that should modifications take place within the site boundary beyond the area tested, additional subsurface investigations should be considered.

P-30-176757 (Santiago Dam)

As a cultural resource, Santiago Dam (Figure 2) was first documented by Cary D. Cotterman of Chambers Group, Inc in 2003. Cotterman prepared a DPR 523 Series Form documenting the dam was built in 1931 as an earthen and concrete structure containing 1,100,000 cubic yards of clay, porous soil, and rock. Cotterman notes the dam is 1,425 feet (0.27 mile) long as it's crest, which rises 136 feet above the surrounding ground at its highest point. Cotterman recommended the dam as eligible for listing on the NRHP under Criterion A (see Subsection 2.1.1 for eligibility criteria).

FIGURE 2: VIEW OF SANTIAGO DAM

5.2 NATIVE AMERICAN SACRED LANDS FILE REVIEW RESULTS

On September 11, 2020, Psomas requested that the NAHC conduct a search of its SLF to determine if cultural resources important to Native Americans have been recorded in the Project site or in the immediate vicinity. The results of the NAHC SLF search were received on October 9, 2020, and were positive for sacred lands in the vicinity of the Project APE. The NAHC recommended contacting the Juaneño Band of Mission Indians Acjachemen Nation – Belardes for more information.

The results letter also included a list of tribes affiliated with the Project APE (see Table 4). Consultation pursuit to AB 52 was conducted by the Districts. The results of the AB 52 consultation between the Districts and local Native American representatives will be documented as part of the CEQA review prepared for the Project. The SLF search results summary letter from the NAHC is presented as Attachment C.

TABLE 4
NAHC TRIBAL REPRESENTATIVES CONTACT LIST

Tribal Organization	Indigenous Affiliation	Contact(s)
Campo Band of Diegueno Mission Indians	Diegueno	Ralph Goff
Ewiiaapaayp Band of Kumeyaay Indians	Diegueno	Robert Pinto; Michael Garcia
Cabazon Band of Mission Indians	Cahuilla	Daniel Salgada
Gabrieleno Band of Mission Indians – Kizh Nation	Gabrieleno	Andrew Salas
Gabrieleno/Tongva San Gabriel Band of Mission Indians	Gabrieleno	Anthony Morales
Gabrielino/Tongva Nation	Gabrielino	Sandonne Goad
Gabrielino Tongva Indians of California Tribal Council	Gabrielino	Robert Dorame
Gabrielino-Tongva Tribe	Gabrielino	Charles Alvarez
Juaneño Band of Mission Indians Acjachemen - Belardes	Juaneño	Matias Belardes
La Posta Band of Diegueno Mission Indians	Diegueno	Gwendolyn Parada; Javaugh Miller
Pala Band of Mission Indians	Cupeno; Luiseno	Shasta Gaughen
Manzanita Band of Kumeyaay Nation	Diegueno	Angela Elliott
Mesa Grande Band of Diegueno Mission Indians	Diegueno	Michael Linton
Pala Band of Mission Indians	Cupeno; Luiseno	Shasta Gaughen
Santa Rosa Band of Cahuilla Indians	Cahuilla	Lovina Redner
Soboba Band of Luiseno Indians	Cahuilla; Luiseno	Isaiah Vivanco

5.2.1 Paleontological Record Search Results

The paleontological records search was completed on October 16, 2020. The record search included a thorough search of the NHM paleontology collection records for the locality and specimen data for the Project APE and surrounding area. The records search identified fossil localities that lie directly within the proposed Project APE as well as numerous fossil localities nearby from the same sedimentary deposits that occur in the proposed Project area, either at the surface or at depth. One locality, LACM IP 26171, is located along the northwest shore of Santiago Reservoir, where unspecified invertebrates were collected from the Williams Formation during excavations for the spillway in 1969 (depth of fossils is not known). Additionally, eight localities were located nearby from the same sedimentary deposits that occurs in the Project site, either at

the surface or at depth. As indicated above, the Project site is generally underlain by Pleistocene to Holocene age alluvium, which could contain unknown fossils.

5.3 ARCHAEOLOGICAL AND PALEONTOLOGICAL FIELD SURVEY RESULTS

As indicated above, a Psomas cross-trained archaeologist/paleontologist surveyed the Project APE on October 20, 2020. The Psomas archaeologist did not identify new archaeological and/or paleontological resources within the Project APE; however, it should be noted the ground visibility was obscured by several species of native and non-native vegetation. Additionally, Psomas relocated archaeological site P-30-001012 (Figure 3). None of the cultural resources recorded by W. H. Bryce 1982 were observed on the surface; however, as MBA noted in 2004 the artifact assemblage and site boundary were not observed due to the site being stripped for agricultural practices along with scattered debris piled and placed along a nearby small drainage (see Attachment D for updated record).

Additionally, the Santiago Dam is located within the Project APE. As noted in the Executive and Management Summary above, a separate historic built environment assessment of the structures and technical report has been prepared by South Environmental.

FIGURE 3: OVERVIEW OF P-30-001012 (CA-ORA-1012)

6.0 DISCUSSION AND IMPACT ANALYSIS

6.1 DISCUSSION

Psomas conducted archaeological resources field investigations within the proposed Project APE on October 20, 2020. The main goal of the investigations was to gather and analyze information needed to determine if the Project would have a significant impact on properties eligible for the NRHP and the CRHR and to provide mitigation measures for those resources. The results of the 2021 SCCIC cultural resources records searches identified 18 previously recorded cultural resources within 1.6 km (1 mile) of the Project site. The previously recorded resources include two precontact isolates (ground stone), 12 precontact sites, three historic sites/built environments and one multicomponent site. The precontact sites consist of rock shelters, lithic scatters (stone debris left over from making stone tools), hearths (roasting pits/remnants of campfires), cairns (rock features), bedrock milling features (ground stone technology), habitation debris (midden), and burials. The historic sites consist of roads/trails, single family residences, standing structures, wells/cisterns, water conveyance systems and a standing engineering structure (dam). Of the 18 cultural resources, two (P-30-001012 and P-30176757) were identified within the Project APE. Cultural resource P-30-001012 is described as a precontact lithic scatter and cultural resource P-30-17657 is the Santiago Dam. Furthermore, the NAHC SLF search was positive for sacred sites. Consultation with tribal representatives was initiated by the Districts.

Fieldwork (archaeological and paleontological survey) relocated P-30-001012; however, none of the cultural resources recorded by W. H. Bryce 1982 were observed on the surface; though, MBA noted in 2004 the artifact assemblage and site boundary for P-30-001012 were not relocated due to the site being stripped for agricultural practices and scattered debris piled placed along a nearby small drainage. No new archaeological resources and/or cultural resources were identified within the Project APE. Nevertheless, it should be noted both the Project APE and the surrounding area should be considered highly sensitive for archaeological resources dating to both the precontact period and the historic era.

Additionally, no new paleontological resources (fossil localities and/or unique geologic units) were identified during the field survey. As noted above, LACM IP 26171, located along the northwest shore of Santiago Reservoir, was collected from the Williams Formation during excavations for the spillway in 1969.

Moreover, the Santiago Dam is located within the Project APE. As noted in the Executive and Management Summary above, a separate historic built environment assessment of the structures and technical report has been prepared by South Environmental.

6.2 FINDINGS OF NO EFFECT/SIGNIFICANT IMPACT

This analysis is provided to assist the Lead Agencies in fulfilling their compliance responsibilities under NEPA and CEQA. The results of the 2021 field study did not identify new archaeological and/or cultural resources. Additionally, the archaeological resource, P-30-001012 was relocated; however, the artifact assemblage and original site boundary for P-30-001012 were not relocated due to the site being stripped for agricultural practices and scattered debris piled placed along a nearby small drainage. Furthermore, MBA evaluated the archaeological site in accordance with CEQA, using criteria outlined for the CRHR eligibility. MBA's conclusion was the site does not qualify for the CRHR and is not a unique archaeological resource for the purposes of CEQA. MBA also concluded it is unlikely that any of the characteristics from the site described by Bryce will be impacted should modifications to the road be necessary at a future date; however, MBA also concluded that should modifications take place within the site boundary beyond the area tested, additional subsurface investigations should be considered.

Moreover, no new fossil localities were identified during the field survey; therefore, all data considered, the proposed Project will not have a significant impact or adverse effect on eligible archaeological resources or known fossil localities and/or unique geological units within the Project APE.

7.0 RECOMMNENDED MITIGATION MEASURES

While no significant and/eligible archaeological and/or TCRs were identified in the Project site, several cultural resources from both the precontact and historic periods of California history have been documented within 1-mile of the Project APE.

Furthermore, no significant paleontological resources were identified in the Project site; however, the results from the NHM identified the Project APE and the surrounding area as highly sensitive for marine fossil localities and unique geologic units.

Therefore, Psomas recommends the following mitigation measures in the event of an accidental discovery of archaeological and/or paleontological resources and adherence to existing regulations and protocols for the discovery of human remains. Furthermore, additional mitigation measures may be requested during the AB 52 tribal consultation process.

7.1 MITIGATION MEASURES

MM CUL-1 Prior to the issuance of the grading permit, the applicant shall provide written evidence to the Districts that the applicant has retained an Orange County-certified archaeologist to observe grading activities within previously undisturbed soils, including geotechnical excavations, and to salvage and catalogue archaeological resources as necessary. The archaeologist shall be present at the pre-grade conference, shall establish procedures for archaeological resource surveillance within previously undisturbed soils, and shall establish, in cooperation with the applicant, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts as appropriate. If archaeological resources are inadvertently unearthed during excavation activities (within disturbed or undisturbed soils), the contractor shall immediately cease all earth-disturbing activities within a 100-foot radius of the area of discovery and the archaeologist and Districts shall be notified immediately. If the archaeological resources are found to be significant, the archeologist, in consultation with the Districts and tribal representatives, shall determine appropriate actions for exploration and salvage. After the find has been appropriately avoided or mitigated, work in the area may resume.

MM GEO 1 Prior to the issuance of the grading permit, the applicant shall provide written evidence to the Districts that the applicant has retained an Orange County-certified paleontologist to observe grading activities within previously undisturbed soils, including geotechnical excavations, and to salvage and catalogue paleontological resources as necessary. The paleontologist shall be present at the pre-grade conference, shall establish procedures for paleontological resource surveillance within previously undisturbed soils, and shall establish, in cooperation with the applicant, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the fossils/unique geological units as appropriate. In the event that paleontological resources are inadvertently unearthed during excavation activities, the contractor shall immediately cease all earth-disturbing activities within a 100-foot radius of the area of discovery and the contractor shall contact the Districts immediately. If the paleontological resources are found to be significant, the paleontologist, in consultation with the District, shall determine appropriate actions for exploration and salvage. After the find has been appropriately avoided or mitigated, work in the area may resume.

7.2 EXISTING REGULATORY REQUIREMENTS

RR CUL-1 If human remains are found during ground-disturbing activities, no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains shall occur, in accordance with Section 7050.5 of the California Health and Safety Code. The County Coroner shall be notified of the discovery immediately. If the County Coroner determines that the remains are or believed to be Native American, s/he shall notify the NAHC in Sacramento within 24 hours of the discovery. In accordance with Section 5097.98 of the California Public Resources Code, the NAHC must immediately notify those persons it believes to be the most likely descended from the deceased Native American. The descendants shall complete their inspection within 48 hours of being granted access to the site by the Districts. The Districts would meet and confer with the most likely descendant regarding their recommendations prior to disturbing the site by further construction activity.

8.0 CERTIFICATION

I hereby certify that the statements furnished above in this draft report and in the attached exhibits present the data and information required for this Historic Property Identification Report (Archaeological Resources) and Paleontological Resources Study, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

DATE: February 9, 2024 SIGNED: 
Charles Cisneros, M.S., RPA
Senior Archaeologist

Re: Native American Tribal Consultation, Pursuant to the Assembly Bill 52 (AB 52), Amendments to the California Environmental Quality Act (CEQA) (Chapter 532, Statutes of 2014), Public Resources Code Sections 5097.94 (m), 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2 and 21084.3, Santiago Dam Project, Orange County

Dear Mr. Cisneros:

Pursuant to Public Resources Code section 21080.3.1 (c), attached is a consultation list of tribes that are traditionally and culturally affiliated with the geographic area of the above-listed project. Please note that the intent of the AB 52 amendments to CEQA is to avoid and/or mitigate impacts to tribal cultural resources, (Pub. Resources Code §21084.3 (a)) ("Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.")

Public Resources Code sections 21080.3.1 and 21084.3(c) require CEQA lead agencies to consult with California Native American tribes that have requested notice from such agencies of proposed projects in the geographic area that are traditionally and culturally affiliated with the tribes on projects for which a Notice of Preparation or Notice of Negative Declaration or Mitigated Negative Declaration has been filed on or after July 1, 2015. Specifically, Public Resources Code section 21080.3.1 (d) provides:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.

The AB 52 amendments to CEQA law does not preclude initiating consultation with the tribes that are culturally and traditionally affiliated within your jurisdiction prior to receiving requests for notification of projects in the tribe's areas of traditional and cultural affiliation. The Native American Heritage Commission (NAHC) recommends, but does not require, early consultation as a best practice to ensure that lead agencies receive sufficient information about cultural resources in a project area to avoid damaging effects to tribal cultural resources.

The NAHC also recommends, but does not require that agencies should also include with their notification letters, information regarding any cultural resources assessment that has been completed on the area of potential effect (APE), such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

- A listing of any and all known cultural resources that have already been recorded on or adjacent to the APE, such as known archaeological sites;
- Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
- Whether the records search indicates a low, moderate, or high probability that unrecorded cultural resources are located in the APE; and
- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

    - Any report that may contain site forms, site significance, and suggested mitigation measures.

      All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code section 6254.10.

3. The result of any Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was positive. Please contact the Juaneno Band of Mission Indians Acjachemen Nation - Belardes on the attached list for more information.

4. Any ethnographic studies conducted for any area including all or part of the APE; and

5. Any geotechnical reports regarding all or part of the APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS are not exhaustive and a negative response to these searches does not preclude the existence of a tribal cultural resource. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the event that they do, having the information beforehand will help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our consultation list remains current.

If you have any questions, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Executive Summary

South Environmental was retained by Psomas to complete a Historic Property Inventory Report (HPIR) for the Santiago Creek Dam Outlet Tower and Spillway Improvements Project (proposed project) located in Orange County, California. This report includes the results of an intensive-level pedestrian survey of all built environmental resources over 45 years old within the project's Area of Potential Effect (APE); building development and archival research; recordation and evaluation of the Santiago Creek Dam Complex (P-30-176757) and the Southern California Edison (SCE) Taiwan 12 kilovolt (kV) overhead distribution line for historical significance in consideration of federal, state, and local designation criteria and integrity requirements; and an assessment of project-related effects on historic properties/historical resources.

The report was prepared in conformance with Section 106 of the National Historic Preservation Act (NHPA) and its implementing regulation Title 36 Code of Federal Regulations (CFR) Part 800, the California Environmental Quality Act (CEQA) Section 15064.5 for historical resources, and in consideration of all applicable local guidelines and regulations concerning cultural resources.

One historic property/historical resource was identified within the project APE: the Santiago Dam Complex (P-30-176757), which currently has a status code of 2S2, indicating it has been determined eligible for the NRHP and is listed in the CRHR. The updated evaluation completed as part of the current study found that the Dam remains eligible for the NRHP/CRHR under Criterion A/1. The Dam is eligible for its important historical associations with water resources development in Orange County, as well as with the citrus agriculture industry.

Although specific aspects of the Dam will be modified, it will remain recognizable as an earthen embankment dam and will continue to perform the historic function for which it is eligible. The character-defining features of the Dam necessary for it to continue to convey its historical significance under Criterion A/1 include its ongoing function as an earthen embankment dam on Santiago Creek, maintaining the same general massing and scale. Therefore, the proposed project will result in no adverse effects to historic properties under Section 106 of the NHPA, and no significant impacts to historical resources under CEQA.

1 Introduction

South Environmental was retained by Psomas to complete a Historic Property Inventory Report (HPIR) for the Santiago Creek Dam Outlet Tower and Spillway Improvements Project (proposed project) located in Orange County, California. This report includes the results of an intensive-level pedestrian survey of all built environmental resources over 45 years old within the project's Area of Potential Effect (APE); building development and archival research; recordation and evaluation of the Santiago Creek Dam Complex (P-30-176757) and the Southern California Edison (SCE) Taiwan 12 kilovolt (kV) overhead distribution line for historical significance in consideration of federal, state, and local designation criteria and integrity requirements; and an assessment of project-related effects on historic properties/historical resources.

The report was prepared in conformance with Section 106 of the National Historic Preservation Act (NHPA) and its implementing regulation Title 36 Code of Federal Regulations (CFR) Part 800, the California Environmental Quality Act (CEQA) Section 15064.5 for historical resources, and in consideration of all applicable local guidelines and regulations concerning cultural resources.

This report was prepared by South Environmental Senior Architectural Historian Laura Carias, MA and Cultural Resources Director Samantha Murray, MA. All project personnel meet the Secretary of the Interior's Professional Qualifications Standards for Architectural History and History (Appendix B).

1.1 Project Location and Description

1.1.1 Project Location

The project is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Figure 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Existing structures include the dam, outlet tower in Irvine Lake, spillway channel, flashboard storage shed, control house/outlet works, energy dissipater structure, dam keeper's house, Irvine Lake pipeline, and dam access road (Figure 2). The project site is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle within the Santa Ana Watershed. The drainage area for the project encompasses approximately 63.4 square miles.

SOUTH ENVIRONMENTAL

1.1.2 Project Description

Project Objectives

The primary objective of the proposed Project is the rehabilitation and replacement of the Santiago Creek Dam outlet tower and spillway facilities. In implementing the proposed Project, the Districts would:

- Ensure the new facilities meet or exceed the current seismic, safety and design requirements established by the California DWR DSOD, which is the governing state agency associated with this Project;
- Satisfy IRWD and SWD's operational requirements;
- Extend the useful life of the facilities;
- Improve water supply reliability; and
- Minimize impacts to local environmental resources and surrounding property owners.

Project Description

General elements of each portion of the Project are included below. A more detailed description of the proposed facilities is included in the Environmental Impact Report (EIR).

- The existing outlet tower would be demolished; the portion below the sediment would be filled with concrete and capped with a concrete plug. A new inclined outlet structure would be constructed on the left abutment. Each riser would include an intake fish screen.
- The inlet/outlet works would be configured to incorporate the new structure, including new valves and fittings. Water from the lake would enter into the new inclined inlet/outlet structure and would convey lake water through an existing conduit under the dam. At the downstream toe of the dam, a new fitting would be installed to bifurcate the flow to the Irvine Lake Pipeline (ILP) or the emergency outlet pipeline. Water that enters the ILP would reach the Districts' distribution systems. Water that enters the emergency outlet pipeline would be released at the end of the new spillway.
- The ILP would be increased from 36 inches to 54 inches to match the pipeline coming from the inclined inlet/outlet structure, as well as to increase the capacity of the line to improve the hydraulic performance of the system.
- The existing spillway would be demolished and replaced with a new side-channel spillway in a rock cut on the left abutment.
- A new access road and ramp would be constructed to provide vehicle access to the new inlet/outlet structure. A new retaining wall would be needed to cut the roadway into the existing slope without affecting the existing landfill facility above.

- A new dam control building would be constructed to house the valve system at the end of the existing dam crest. The preliminary layout shows a fire-hardened building with dimensions 52 feet by 18 feet and a height of 12 feet.
- The dam crest would be widened from 10 feet to 12 feet with a retaining wall on the downstream side of the crest. The retaining wall would be 1,300 feet in length and would have a height of 10 feet.
- The dam crest would be raised with an approximately 1.5-foot-tall concrete parapet wall on the upstream side of the dam crest.
- A new emergency access walkway (5 feet wide) and stair system would be constructed along the left wall of the new spillway channel to reach the inlet/outlet structure and dam crest from the adjacent landfill during a spillway event. The walkway would connect to the new access road (described above).
- A new steel bridge structure would be included for vehicles across the new spillway.
- Existing structures would be demolished, including the existing outlet tower, portions of the existing spillway, portions of the upstream dam embankment concrete facing, storage building on the dam crest, portions of the outlet works, portions of the ILP, catwalk/stairs across Santiago Creek, and piezometers/monitoring wells.
- The existing Southern California Edison (SCE) overhead power lines and power poles in the vicinity would be relocated outside the construction limits. This relocation would be completed by SCE.
- When construction is occurring, the lake would be dewatered and an access road would be located along the edge of the dewatered lakebed to allow construction access between the staging area and the dam structure.

1.1.3 Area of Potential Effect

The APE is the geographic area or areas within which an undertaking may directly or indirectly cause changes in the character or use of historic properties if any such properties exist. Determination of the APE is influenced by a project's setting, the scale and nature of the undertaking, and the different kinds of effects that may result from the undertaking (36 CFR 800.16(d)).

The project APE for built environment resources includes the entirety of the Santiago Dam Complex, which includes Irvine Lake and the Santiago Dam and its associated infrastructure to the north where project-related impacts will occur. The APE Map (Figure 2) identifies all the existing built environment within the APE.

2 Regulatory Framework

2.1 Federal

2.1.1 The National Historic Preservation Act

Section 106 of the NHPA (16 United States Code 470f) requires federal agencies to account for the effects of their undertakings on historic properties, and to afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on such undertakings. Historic properties are defined as buildings, structures, districts, sites, or objects which are included in or eligible for inclusion in the NRHP. Section 106 is implemented through 36 Code of Federal Regulations (CFR) Part 800, which outlines the process for historic preservation review, including participants, identification efforts, and the assessment and resolution of adverse effects. Per 36 CFR 800.16(y), a federal undertaking is defined as any project requiring or receiving a federal permit, license, approval, or funding. Federal agencies must take steps to determine if the undertaking would result in adverse effect to historic properties and take measures to avoid or resolve those effects as feasible.

2.1.2 National Register of Historic Places

The NRHP is the United States' official list of districts, sites, buildings, structures, and objects worthy of preservation. Overseen by the National Park Service, under the U.S. Department of the Interior, the NRHP was authorized under the National Historic Preservation Act, as amended. Its listings encompass all National Historic Landmarks and historic areas administered by the National Park Service (NPS).

NRHP guidelines for the evaluation of historic significance were developed to be flexible and to recognize the accomplishments of all who have made significant contributions to the nation's history and heritage. Its criteria are designed to guide federal agencies, state and local governments, and others in evaluating potential entries in the NRHP. For a property to be listed in or determined eligible for listing, it must be demonstrated to possess integrity and to meet at least one of the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent

a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.

Integrity is defined in NRHP guidance, How to Apply the National Register Criteria for Evaluation, as "the ability of a property to convey its significance. To be listed in the NRHP, a property must not only be shown to be significant under the NRHP criteria, but it also must have integrity" (NPS 1990). NRHP guidance further asserts that properties be completed at least 50 years ago to be considered for eligibility. Properties completed fewer than 50 years before evaluation must be proven to be "exceptionally important" (criteria consideration G) to be considered for listing.

2.2 State

2.2.1 California Register of Historical Resources

In California, the term "historical resource" includes but is not limited to "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (California PRC Section 5020.1(j)). In 1992, the California legislature established the California Register of Historical Resources (CRHR) "to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (California PRC Section 5024.1(a)). The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, enumerated below. According to California PRC Section 5024.1(c)(1–4), a resource is considered historically significant if it (i) retains "substantial integrity," and (ii) meets at least one of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

(2) Is associated with the lives of persons important in our past.

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

(4) Has yielded, or may be likely to yield, information important in prehistory or history.

In order to understand the historic importance of a resource, sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource. A resource less than 50 years old may be considered for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance (see 14 CCR 4852(d)(2)).

The CRHR protects cultural resources by requiring evaluations of the significance of prehistoric and historic resources. The criteria for the CRHR are nearly identical to those for the NRHP, and properties listed or formally designated as eligible for listing in the NRHP are automatically listed in the CRHR, as are the state landmarks and points of interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

2.2.2 California Environmental Quality Act

As described further below, the following CEQA statutes and CEQA Guidelines are of relevance to the analysis of archaeological, historic, and tribal cultural resources:

- California PRC Section 21083.2(g) defines "unique archaeological resource."
- California PRC Section 21084.1 and CEQA Guidelines Section 15064.5(a) define "historical resources." In addition, CEQA Guidelines Section 15064.5(b) defines the phrase "substantial adverse change in the significance of an historical resource." It also defines the circumstances when a project would materially impair the significance of an historical resource.
- California PRC Section 21074(a) defines "tribal cultural resources."
- California PRC Section 5097.98 and CEQA Guidelines Section 15064.5(e) set forth standards and steps to be employed following the accidental discovery of human remains in any location other than a dedicated ceremony.
- California PRC Sections 21083.2(b)-(c) and CEQA Guidelines Section 15126.4 provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures; preservation-in-place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

More specifically, under CEQA, a project may have a significant effect on the environment if it may cause "a substantial adverse change in the significance of an historical resource" (California PRC Section 21084.1; CEQA Guidelines Section 15064.5(b).) If a site is either listed or eligible for listing in the CRHR, or if it is included in a local register of historic resources or identified as significant in a historical resources survey (meeting the requirements of California PRC Section 5024.1(q)), it is a "historical resource" and is presumed to be historically or culturally significant for purposes of CEQA (California PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)). The lead agency is not precluded from determining that a resource is a historical resource even if it does not fall within this presumption (California PRC Section 21084.1; CEQA Guidelines Section 15064.5(a)).

A "substantial adverse change in the significance of an historical resource" reflecting a significant effect under CEQA means "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1); California PRC Section 5020.1(q)). In turn, CEQA Guidelines section 15064.5(b)(2) states the significance of an historical resource is materially impaired when a project:

1. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or
2. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the PRC or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
3. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

Pursuant to these sections, the CEQA inquiry begins with evaluating whether a project site contains any "historical resources," then evaluates whether that project will cause a substantial adverse change in the significance of a historical resource such that the resource's historical significance is materially impaired.

2.3 Local

2.3.1 Orange County General Plan

Chapter VI. Resources Element; Cultural-Historic Resources

Preservation of Orange County's significant archaeological, paleontological and historical resources in a manner that both preserves the site and is compatible with development is desirable. The County encourages early identification of significant resources in order that cultural resources can be given major consideration in land use planning.

Goals, Objectives, and Policies: Cultural-Historic Resources

Goal 1. To raise the awareness and appreciation of Orange County's cultural and historic heritage.

Objectives

1.1 Facilitate and participate in activities that inform people about the social, cultural, economic, and scientific values of Orange County's heritage.

1.2 Work through the Orange County Historical Commission in the areas of history, paleontology, archaeology, and historical preservation.

Policies

1.1 To stimulate and encourage financial support for projects in the public and private sector.

1.2 To coordinate countywide programs and be the liaison for local organizations.

1.3 To advise and aid the public and private sectors in meeting museum needs and finding funding sources for same.

1.4 To stimulate and encourage research, writing, and publication of articles on Orange County subjects.

1.5 To develop and maintain a County archive for historically valuable records.

1.6 To encourage and facilitate cooperation among local historical societies.

Goal 2. To encourage through a resource management effort the preservation of the county's cultural and historic heritage.

Objectives

2.1 Promote the preservation and use of buildings, sites, structures, objects, and districts of importance in Orange County through the administration of planning, environmental, and resource management programs.

2.2 Take all reasonable and proper steps to achieve the preservation of archaeological and paleontological remains, or their recovery and analysis to preserve cultural, scientific, and educational values.

2.3 Take all reasonable and proper steps to achieve the preservation and use of significant historic resources including properties of historic, historic architectural, historic archaeological, and/or historic preservation value.

2.4 Provide assistance to County agencies in evaluating the cultural environmental impact of proposed projects and reviewing EIRs.

2.5 Provide incentives to encourage greater private sector participation in historic preservation.

Policies

The following policies addressing archaeological, paleontological, and historical resources shall be implemented at appropriate stage(s) of planning, coordinated with the processing of a project application, as follows:

- Identification of resources shall be completed at the earliest stage of project planning and review such as general plan amendment or zone change.
- Evaluation of resources shall be completed at intermediate stages of project planning and review such as site plan review, subdivision map approval, or at an earlier stage of project review.
- Final preservation actions shall be completed at final stages of project planning and review such as grading, demolition, or at an earlier stage of project review.

Historic Resources Policies

1. To identify historic resources through literature and records research and/or on-site surveys.

2. To evaluate historic resources through comparative analysis or through subsurface or materials testing.

3. To preserve significant historic resources by one or a combination of the following alternatives, as agreed upon by RDMD and the project sponsor:

a) Adaptive reuse of historic resource.

b) Maintaining the historic resource in an undisturbed condition.

c) Moving the historic resource and arranging for its treatment.

d) Salvage and conservation of significant elements of the historic resources.

e) Documentation (i.e., research narrative, graphics, photography) of the historic resource prior to destruction.

Goal 3. To preserve and enhance buildings structures, objects, sites, and districts of cultural and historic significance.

Objectives

3.1 Undertake actions to identify, preserve, and develop unique and significant cultural and historic resources.

3.2 Develop and maintain a County archive for historically valuable records, thereby promoting knowledge and understanding of the origins, programs, and goals of the County of Orange.

Policies

3.1 To pursue grants and innovative funding strategies for acquisition or development of significant properties.

3.2 To develop, utilize, and promote effective technical conservation and restoration strategies.

3.3 To appraise, collect, organize, describe, preserve, and make available County of Orange records of permanent, historical value.

3.4 To serve as a research center for the study of County history

2.3.2 Orange County Municipal Code

Sec. 7-9-42.2. - Definitions

Historic structure. Any structure that is:

(1) Listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;

(2) Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district;

(3) Individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of Interior; or

(4) Individually listed on a local inventory of historic places in communities with historic preservation programs that have been certified either by an approved state program as determined by the Secretary of the Interior or directly by the Secretary of the Interior in states without approved programs.

3 Survey and Research Methods

3.1 Built Environment Survey

A survey of all built environment within the APE was completed by Psomas on July 17, 2023. The survey included documenting all built environment with notes and photographs, as well as the immediate setting.

3.2 Background Research

3.2.1 Previous Evaluations of the Santiago Dam (30-176757)

The Santiago Dam is listed in the Office of Historic Preservation's (OHP's) Built Environment Resources Directory (BERD) with a status code of 2S2, indicating it was determined eligible for the NRHP by consensus through the Section 106 process and is listed in the CRHR.

The Santiago Dam was first recorded and evaluated for historical significance by Carey D. Cotterman of Chambers Group, Inc. in 2003, who found the dam eligible under NRHP Criterion A for its important historical associations (Cotterman 2003:3, see Appendix A, DPR Forms):

> The water provided by the creation of Santiago Dam and Reservoir contributed significantly to the early and mid-20th century development of the citrus industry in Orange County, which was a leading supplier of oranges, lemons, and grapefruit to the entire nation at that time. Therefore, given its strong association with the history of water resources development in Orange County, as well as with the citrus agriculture industry on not only a regional but on a state and national level, the dam is recommended eligible for listing on the NRHP under Criterion A. Because the dam has undergone little modifications since its construction, it retains good integrity of location, design, materials, workmanship, and association.

In 2021, PaleoWest LLC prepared a Continuation Sheet update to Cotterman's 2003 evaluation stating they "found no evidence to indicate that the historic integrity of the Santiago Dam has been compromised subsequent to its initial recordation in 2003. Therefore, PaleoWest, LLC concurs with the 2003 recommendation that the Santiago Dam is eligible for listing on the NRHP under Criterion A at the local, state, and national level and retains sufficient integrity to convey that historical significance" (PaleoWest LLC 2021:1 see Appendix A, DPR Forms).

Neither of these studies appear to have addressed the eligibility of other aspects of the Dam Complex, such as the Dam Keeper's Residence, Dam Keeper's Garage, Second Garage, Storage Shed, Orange County Waster & Recycling (OCWR) Landfill Flare Facility, or Control Building and Valve Vault.

3.2.2 Psomas-Provided Materials

South Environmental reviewed all background materials provided by Psomas regarding the dam. These materials included previously conducted built environment studies, historic photographs and current architectural and engineering plans.

3.2.3 Historical Newspaper Search

South Environmental reviewed all available historical newspapers covering the APE in an effort to understand the development of the project APE and surrounding areas and to review relevant articles pertaining to Santiago Dam development and other structures within the project APE.

3.2.4 Sanborn Fire Insurance Maps

South Environmental reviewed Sanborn Fire Insurance Company maps, available on the Los Angeles Public Library website, to understand the development of properties in and around the project APE. No Sanborn maps were available for the location of the project APE.

3.2.5 Historical Aerial Photographs

South Environmental reviewed all available historic topographic maps and aerial imagery to understand the development history of the project APE. Historic topographic maps of the APE were available from USGS topoView for various years for the Black Star Canyon (1949, 1950, 1967, 1974, 1997, 2012, 2015, 2018, 2022) Quadrangle. Historic aerial photographs of the APE were available from Nationwide Environmental Title Research LLC (NETR) for the years 1946, 1948, 1952, 1963, 1966, 1967, 1972, 1980, 1981, 1985, 1987, 1988, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2002, 2003, 2004, 2005, 2009, 2010, 2012, 2014, 2016, 2018, and 2020 and from the University of California, Santa Barbara, FrameFinder Maps for the years 1931, 1938, 1947, 1952, 1960, 1969, 1977, 1983, 1989, 2002, and 2007 (NETR var., UCSB var.).

4 Historic Context: Santiago Dam

The following historic context is adapted from Donovan-Boyd, Kaiser, and Murray 2021.

4.1 Rancho Lomas de Santiago

Extensive land grants or ranchos were established in the interior during the Mexican period (1822-1848), in part to increase the population inland from the more settled coastal areas where the Spanish first concentrated their colonization efforts. The APE is located in Ranchos Lomas de Santiago, originally owned by José Antonio Yorba's youngest son, Teodocio Yorba. Yorba was granted Rancho Lomas de Santiago (Ranch of the Hills of St. James) in 1846, just before California was annexed to the United States at the end of the Mexican American War. The Yorba family was one of the most successful landowners in Southern California during the Mexican Period. Beginning in the 1840s and 1850s, the Yorba family had acquired six adjoining ranchos (Nelson 2009:2). Yorba filed a United States claim for the Rancho Lomas de Santiago in 1852.

Teodosio Yorba sold Rancho Lomas de Santiago to William Wolfskill in 1860 for $7,000 and Joseph E. Pleasants took charge of Wolfskill's new cattle operations. Already overgrazed, and largely unfarmable due to its steep, hilly terrain, the Santa Ana range could not sustain large cattle herds. In 1866, Benjamin and Thomas Flint, Llewellyn Bixby and James Irvine acquired the rancho from Wolfskill, and it eventually became part of the Irvine Ranch (Irvine Historical Society 2020).

4.2 Development of the Irvine Ranch

The APE is located in the northern portion of what would become known as the Irvine Ranch, one of the largest, most prosperous agricultural operations in Orange County. William Wolfskill purchased the land that would become the Irvine Ranch from Teodocio Yorba in c. 1860 with plans to use the land for grazing sheep (Nelson 2009:2). Wolfskill was a California pioneer, and a prolific landowner, businessman, and rancher. He is also credited with being one of California's first Valencia orange ranchers (OCHC 1983: Section 8). In 1866, Wolfskill sold the 47,000-acre property to Benjamin and Thomas Flint, Llewellyn Bixby, and James Irvine (Irvine Historical Society 2020). Flint and Bixby were also sheep men, who were expanding their land holdings to increase their annual production of wool (Nelson 2009:2).

James Irvine, a pioneer of California agriculture and prosperous San Francisco merchant, purchased the Flint and Bixby shares of the Rancho Lomas Santiago in 1876 for $150,000 dollars. This gave Irvine control of approximately 110,000 acres of land in and around the Santa Ana Canyon (Nelson 2009:3). Irvine, an Irishman, came to America in 1846, and lived for a time in New York City. He came to California in 1849, to find his fortunes in the California Gold Rush. After working in the mines for several years, Irvine began selling merchandise to miners, and eventually established a successful market in San Francisco (The San Francisco Examiner 1886:3). James Irvine died in 1886, leaving his estate to his

son, James Irvine Jr. George Irvine, James Irvine Sr.'s brother, managed the property until Irvine Jr. came into possession of the estate at the age of 25 (Nelson 2009:2; The Mail 1886:2).

When James Irvine Jr. took over the estate in 1892, he converted the ranch into an "increasingly modern, productive enterprise of field crops, grain and irrigated orchards," which was achieved by digging wells, building reservoirs, and laying pipeline to irrigate the crops (Nelson 2009:3). In 1893, Irvine Jr. began to divert water from Santiago Creek to an area known as "The Flats" where the property's new ranch house was located. Also, in the 1880s, Irvine Jr. began to lease land to tenant farmers. These farmers grew grain and bean crops that required minimal rainfall and little to no irrigation. Historic aerials from 1946 suggest the Project site was never brought under agricultural use during the Irvine ownership. While the Project site does not appear to have been cultivated, the road through Santiago Canyon, along the Santiago Creek, that eventually becomes Santiago Canyon Road, is visible on the 1901 topographic map of the area in generally the same orientation as it found today.

4.2.1 The Irvine Company

In 1894, James Irvine Jr. incorporated the Ranch as the Irvine Company and became the company's first president (Brower 2013: xxi). One of James Irvine Jr's first acts as president was to donate 160 acres of land, that had long been a popular pioneer picnic spot, to the State Board of Supervisors. This donation, land northeast of Irvine Lake, became the Irvine Ranch Historic Park, which is now the oldest park in Orange County (OCHC 1983: section 8). Around this same time, in 1889, Orange County formed out of parts of Los Angeles County (Figure 3). When Orange County was formed, the Irvine Company owned almost one-fifth of the County's acreage.

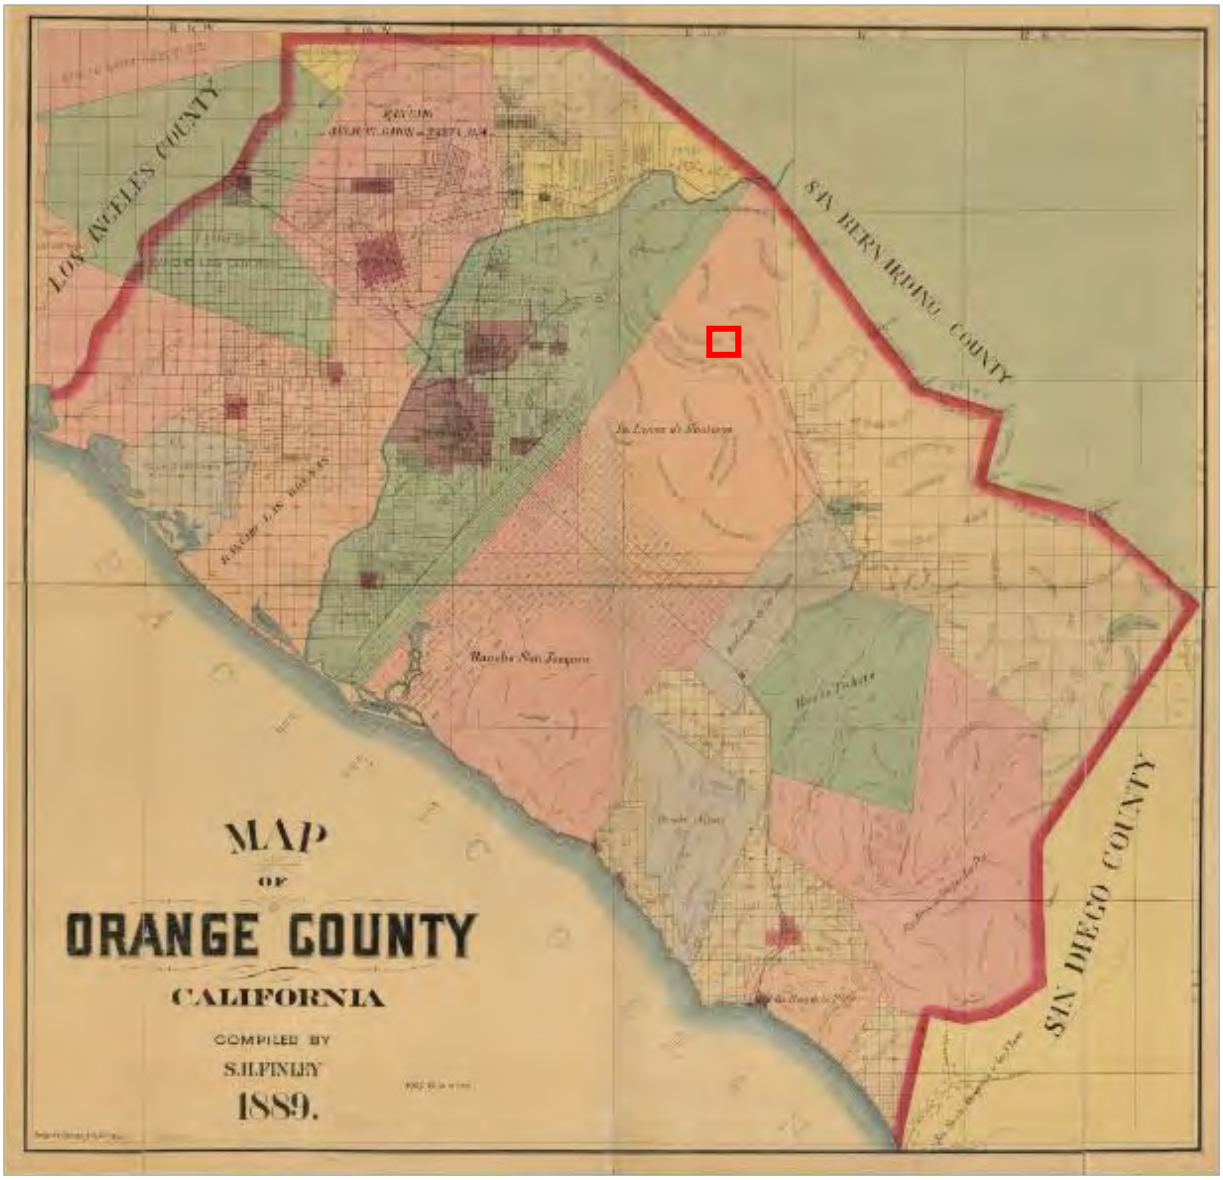

Figure 3. Orange County California Map, 1889. Shows the Ranchos and the growing population areas of Orange County. Compiled by S.H. Finley. Approximate Project Location in red (Library of Congress, Geography and Map Division) (Finley 1889).

Irvine Ranch quickly became one of the most productive tracts in California, known for the growing of lima beans, black-eyed peas, barley, oats, sugar beets, olives, walnuts, lemons, and oranges (Santa Ana Daily Register 1915:8). As the tenants on the Irvine Ranch increased, James Irvine Jr. developed an extensive system of wells to irrigate the land (Nelson 2009:7). By 1920, it is estimated that nearly 1,200 wells had been drilled on his acreage and many were running with electric pumps. By 1930, the Irvine Ranch had 31,000 acres of lima beans under cultivation, which was often described as the "largest lima bean field in the world" (Nelson 2009:7).

In 1935, James Irvine III (known as Jase), Irvine Jr.'s oldest son, tragically died of tuberculosis. Jase was on track to be the president of the Irvine Company and his death left James Irvine Jr. distraught and without sound leadership for the future of the company (Brower 2013: xxi). Several years later, in 1937, James Irvine Jr. established the James Irvine Foundation with 51% of the company's stock to be held by the foundation and the other 49% to be distributed to family (Brower 2013: xxii).

4.2.2 Irvine Ranch Water Management Facilities

Ongoing water quality problems and water scarcity made it clear that further work was necessary to irrigate crops at Irvine Ranch. The water conveyance facilities on the Ranch became one of the largest water management systems in Orange County. The first distribution irrigation feature on the Irvine Ranch property was the Irvine Ditch, constructed in 1893 from the Santiago Canyon to the Peters "Flats" (near the present-day location of the Peters Canyon Dam, which is approximately 2 miles to the west of the Project site). Wells were the primary source of water at the turn of the century, with 1,200 wells constructed in the area, most equipped with electric pumps. These wells allowed for large citrus orchards to be planted starting in 1906 (Nelson 2009: 17).

Irvine began to construct a series of winter water conservation features on the Ranch starting in the 1920s. Water runoff and irrigation rights were a constant struggle between the Irvine, Carpenter, and Serrano Irrigation Districts and the conservation projects were an effort to offset the marked decline in his groundwater system. P. R. Browning was the principal designer of all the Ranch's water conservation facilities except for the Santiago Dam which was designed by Augustus Kempkey (Nelson 2009:7). The dispute between the competing irrigation districts was eventually settled in 1928, with an agreement between the three litigants that led to the construction of the Santiago Dam and Outlet Tower (Nelson 2009:8). This period also saw the establishment of a massive irrigation system on the site (Brower 2013: xxi). In 1950, there were 4,550 irrigated acres and 33,430 dry farming acreage. Just ten years later, the Irvine company had increased the irrigated acreage to 7,417 acres and dry farming acres accounted for only 16,853 acres (Nelson 2009: 18).

County-wide flood control bonds failed to gather appropriate support in 1929 and 1931, leaving James Irvine Jr. to complete some large-scale water management projects without government support. Flood control created both land security and pooled runoff water for domestic and agricultural uses. Irvine was increasingly worried about water rights, and in 1932 he filed suit against upper basin users to protect the rights to the Santa Ana River (OCWD 2015: 24). The following water conservation projects were completed on the Irvine Ranch Site between 1929 and 1959: Lambert Reservoir (1929); Santiago Dam (1931); Irvine Conservation Dam (1932); Peters Canyon Dam (1931); the High Line Canal (1930s); Laguna Reservoir (1937-38); Bonita Reservoir (1937-38); Little Peters Reservoir (1940); Sand Canyon Reservoir (1942); Syphon (sometimes spelled Siphon) Canyon Dam (1948-49); and the Rattlesnake Canyon Reservoir (1959) (Nelson 2009:8). In 1970, the construction of the Irvine Lake Pipeline brought water from the Colorado River to the Rattlesnake Canyon Reservoir.

4.3 Consolidation of Orange County Water Districts

While the Irvine Ranch was creating a sophisticated water system for Ranch operations, the rest of Orange County was using a patchwork method of establishing water rights. Early water conveyance developments in Orange County generally organized as groups of property owners that banded together to provide water services through groundwater wells, these co-ops were called "mutuals." The mutuals sold shares of water to landowners based on the number of acres held by each property owner. As metropolitan areas grew it became clear that the current system, collections of property owners, would not be sufficient for the rapidly growing population in Orange County (MWDOC 2017).

In 1928, several southern Orange County cities banded together to form the Metropolitan Water District of Southern California (MWD) with the lofty goal of importing water from the Colorado River. The MWD succeeded in the planning and construction of the Colorado River Aqueduct, which, starting in 1939, brought water from the Colorado River near the Arizona border to the east side of the Santa Ana Mountains. This ongoing consolidation of the cooperative system became a necessity as water became Southern California's most precious resource. In 1957, there were an estimated 151 of these mutual water groups remaining in Orange County. By 1963, it was estimated that by 1965, no more than 25 would remain. Postwar population growth further encouraged the consolidation of mutuals and districts and in other areas, growth brought city services within reach of previously rural areas (LAT 1963c:2).

The success of the MWD, and the continued need for more water lead to the formation of several other large districts who hoped to tap into Colorado River water as well as Northern California water from the State Water Project. Developments continued into the 1960s and 1970s to move water through areas in eastern Orange County. The Santiago lateral, completed in 1961, and the East Orange County Feeder Line No, 2, both extended water into the southeast section of the County (LAT 1961a: E:2; LAT 1961b: 52).

4.3.1 Irvine Ranch Water District

The IRWD was formed by the Irvine Company in 1961 as a California Special District with headquarters in Irvine. Orange County approved the boundaries of the District in December of 1960, with the District being bound on the west by Newport Avenue, the south by the Santa Ana Marine Corps Air Facility, the east by the Rancho Canada De Los Alisos, and the north by the Coastal Municipal Water District (LAT 1960: R-28cia). The District's boundaries initially included approximately 60 square miles (IRWD 2021: Liquid News). Initially, the IRWD served mainly agricultural customers, but the quickly growing Orange County population included many residential customers in need of water. The IRWD grew through annexations in the 1960s and 1970s and by 1991, the District provided water to one-sixth of Orange County (LAT 1991: A3).

As water districts became more established, growth continued through consolidation of districts. Between 1997 and 2008, the IRWD consolidated with five other water districts, including the South

Coast Water District in 2006. Other districts that joined the IRWD include: Orange Park Acres Mutual Water Company (2008), Los Alisos Water District (2001), Carpenter Irrigation District (2000), and the Santa Ana Height Mutual Water Company in (1997) (IRWD 2021: Consolidations). Today the IRWD serves more than 425,000 residential customers and spans 181 square miles (IRWD 2021: Liquid News).

4.3.2 Serrano Irrigation District

The Serrano Irrigation District, now known as the Serrano Water District (SWD), was developed in 1876 by a consolidation of several water companies and associations privately-owned by ranchers and farmers in Villa Park. The Serrano Water Association, the John T. Carpenter Water District, and the Irvine Company came together in 1927 to form the Serrano Irrigation District as a public corporation under the Irrigation Districts Act of the State of California. "This enabled the district to hold elections to establish the bonds to finance their share of the construction of the Santiago Dam." (OAC n.d.). The Serrano Irrigation District was responsible for issuing bonds and borrowing money for the construction of the Santiago Dam and The Irvine Company provided the land (Serrano Irrigation District n.d.).

In the early 1960s, the decrease in need for agricultural water led the district to build a water filtration plant and then later reservoirs at Sycamore and Taft to use water from the Irvine Lake for residential use (Serrano Irrigation District n.d.). Today, the district has 43 miles of pipe, three wells, two reservoirs, and one treatment plant. The district owns fifty percent of Irvine Lake and is the managing district for Irvine Lake (Serrano Water District 2023).

4.3.3 Post St. Francis Dam Disaster Development (1928-1947)

In 1928 the St. Francis Dam, located in the Santa Clara Valley just outside Los Angeles, failed, killing 430 people, destroying 1,250 buildings and 7,900 acres of farmland, to become one of the greatest dam failure disasters of the 20th century. Between 1929 and 1931, the State engineer examined 827 dams and found near one third of them to require significant repairs according to new safety guidelines.

In 1929, the State of California also required any person that practices civil engineering or any of its branches to be registered with the state. This also included any person that acted in the position of an "assistant engineer" or higher. The state also created a board which developed standards for applicants that wanted to register with the state as an engineer. Some standards included: must be over 25 years of age, demonstrate no less than six years of professional experience, work references, and an application fee (Rogers n.d.).

4.4 Property Types

The following discussion of property types is adapted from Murray et al 2020:

Reservoir complexes, like Irvine Lake, are usually comprised of several elements including the water-retaining structure (dam), a water-retention area (reservoir), a water-releasing structure (spillway), a water-conveying structure (conduits and outlet tower), and other essential elements including water treatment plants (Zhang et al 2016). Each of these portions of the reservoir provides an essential function that ensures water will be retained and released safely.

4.4.1 Dams

The purpose of a dam is to store water and facilitate flood control for human and livestock water supply, irrigation, energy generation, recreation, and pollution control. Typically, dams fulfill a combination of these functions. Manmade dams are classified according to their type of construction, materials, slope, seepage control method, and resistance to the forces of water pressure. The materials used to construct modern dams included earth, rocks, concrete, masonry, steel, timber, rubber, and sometimes a combination of these materials. Dams can be classified into five basic types including embankment, concrete, gravity, buttress, and arch (ASDSO 2020).

Embankment Dams

Embankment dams are a type of massive dam that is built with natural materials, either rock or earth instead of concrete, leading to the sub-classification of earth-filled embankment dams and rock-filled embankment dams. The basic elements of embankment dams consist of a core, an earth- or rock-filled embankment on both sides, and protection on the upstream face. Embankment dams are trapezoidal in shape and resist the flow of water by both their strength and weight. Embankment dams can retain water because they have a low permeability throughout the structure or a layer of low-permeability material (Billington et al. 2005; TCEQ 2018).

Earth-filled Embankment Dams

Earth-filled embankment dams were the first type of dam to be constructed by humans and were first documented in approximately 3,000 BC in the Middle East. In fact, earth-filled embankment dams are still the most prevalent dam-type, and a 2005 report on large federal dams estimated that of the 70,000 dams present in the United States, 85% were earth-filled embankment dams. Many of the dams in the United States were built in the early twentieth century prior to the advent of technology that would have facilitated the construction of structural dams. However, the report goes on to say that throughout the twentieth century, even with the advent of new technology, 65% of the dams built were earth-filled embankment dams. Earth-filled dams are the most prevalent type of dam because they can be built from locally available materials that require minimal processing, saving money on the construction process. The main detraction from earth-filled dams is that they are subject to the erosive

action of water if a sufficient spillway is not provided as part of the dam design (Billington et al. 2005; Bureau of Reclamation 1987). Examples of other earth-filled embankment dams in Orange County include:

- Peters Canyon Dam (1929)
- Villa Park Dam (1963)
- Seven Oaks Dam (1993)

4.4.2 Reservoirs

A reservoir is typically formed by the construction of a dam across a linear water source, such as a river or creek, to create an artificial lake where water is stored. The adjacent dam is responsible for the amount of water that flows out of the reservoir, therefore controlling its water level. The amount of water in a reservoir can also be controlled by natural elements including rainfall, snowfall, and droughts. In conjunction with storing water, reservoirs often become recreation centers for boating and fishing. The water in a reservoir is very still causing sediment to sink to the bottom which over time can reduce the total amount of water in the reservoir (NG 2020).

4.4.3 Spillways

A spillway is a structure used for the control of flood flows and diverting surplus water from a reservoir after it has been filled. The primary purpose of a spillway is to ensure water does not overtop the dam and destroy it. A controlled spillway manages flood water through the use of gates, where an uncontrolled spillway only utilizes the elevation of the spillway crest to control the water. The gates allow small amounts of water to be released to prevent a sudden large discharge of water which could cause the dam to fail. There are seven types of spillways including straight drop, ogee, shaft, chute, side channel, siphon, and labyrinth (PE 2019).

4.4.4 Outlet Towers

The outlet tower is a vertical structure located within the reservoir used for capturing water and conveying it to a hydroelectric or water-treatment plant. The tower sits above an outlet tunnel or pipe used to transport the water out of the reservoir which is controlled by the opening and closing of valves or gates. The value controls are usually located in a room at the top of the outlet tower (BDS 2020).

4.4.5 Secondary Property Types

Unlike the primary property types discussed above, secondary property types are not necessarily vital to keeping the reservoir complex running. Although secondary property types range greatly in their design and function, they are frequently associated with dam and reservoir sites. Examples of

secondary property types include Dam Keeper's houses, cisterns and water tanks, pumping stations, wells, vaults, and any other components the larger water system built to support the reservoir complex.

- Dam Keeper's House: a small purpose-built cottage constructed to house the dam's keeper who moderated water levels in response to drought and heavy rain
- Cistern and Water Tank: an artificial reservoir, tank, or container used for the storing or holding of water on a dam site
- Pumping Station: Building(s) of this type can vary in size, their function is to house machinery that transport water from one site to another.
- Well: An excavation or structure created by digging, driving, or drilling to access water underground

5 Historic Context: Southern California Edison

SCE's Historic-Era Electrical Infrastructure Management Program (HEIMP) requires examination of electrical infrastructure in consideration of three major themes: 1) association with SCE's organizational history; 2) association with SCE's construction and implementation campaigns or the established period of significance for 66kV, 220kV, and 500kV systems; and 3) association and embodiment of SCE's architectural programming and aesthetic ideology at SCE Substations (Tinsley Becker et al 2017). The following historic context examines relevant portions of these major themes in consideration of the types of SCE resources identified within the APE (see Section 6, Identified Resources), referencing information from the HEIMP and other relevant sources throughout.

5.1 Organizational History

The West Side Lighting Company was formed by a syndicate of businessmen from Los Angeles in 1896. One year later, the company merged with General Electric to become the new Edison Electric Company of Los Angeles. Soon after, the newly formed Edison Electric Company began to look for additional power supplies in Downtown Los Angeles and purchased the Southern California Power Company in 1898. Over the next few years, Edison merged with other electric lighting and power companies, expanding its footprint beyond Los Angeles to areas as far as Santa Barbara and Redlands. By 1909, the Edison Electrical Company provided service to over 600,000 customers across five counties. "To reflect this expanded presence, the company was reincorporated as the Southern California Edison Company (SCE)." (Williams et al 2016).

In the early part of the twentieth century, SCE continued to expand its service territory throughout Southern California, beginning construction of the Long Beach Steam Plant in 1910 and new 66kV steel tower transmission lines to upgrade the old 33kV network of wood poles. After successfully merging with Henry Huntington's Pacific Light and Power Company (PLPC) in 1916, SCE added 69 additional communities to its service territory. SCE then focused its efforts on expanding the existing 150kV Big Creek Hydroelectric System, upgrading it to 220kV in 1923. In the 1920s SCE undertook a massive building campaign which included "dams and reservoirs, building of powerhouses, rail lines, and tunnels, as well as support camps replete with food and housing for workers, recreation and entertainment offerings, medical facilities, and administrative offices." (Williams et al 2016)

In 1930, SCE contracted with the U.S. Department of the Interior to generate power for construction of the Hoover Dam. Similar contracts were established between the U.S. federal government and the City of Los Angeles and Southern Sierras Power Company (SSP) in order to pay for project costs over a 50-year period. Initially constructed for the purpose of powering construction of the Hoover Dam, the SSP Boulder Dam to San Bernardino Transmission line went into service in 1931. Upon completion of the dam, the line carried electricity to San Bernardino. This line was acquired by SCE as part of the 1964 Calectric merger (Tinsley Becker et al 2017).

Calectric and SCE had overlapping service territories from approximately 1917 until 1964 throughout the Los Angeles Basin and Inland Empire. In order to improve costs, Calectric was acquired by SCE in 1964. This was last major merger/change in the company's organizational history (Tinsley Becker et al 2017).

5.2 Transmission Lines

In the first part of the twentieth century, SCE was continuing to expand in response to a growing Southern California region. "By 1904 the common voltage capacity of transmission lines was reported to be 66,000 volts (66kV), which was considered the minimum voltage necessary for lighting plants in major United States cities." (Tinsley 2017). The earliest identified steel lattice towers within the existing SCE System were installed for the Kern River-Los Angeles Transmission Line in 1907. Shortly thereafter, SCE implemented additional all-steel lattice tower lines throughout its 66kV system. In 1910, SCE began construction of its Long Beach Steam Plant and implemented a new 66kV transmission line system to replace the old 33kV wooden pole lines that had been installed at the end of the 19th century. By 1912, double-circuit 66kV towers were widely used, coinciding with the completion of the Long Beach Steam Plant between 1910 and 1914 (Tinsley Becker et al 2017).

The SCE Big Creek Hydroelectric System East-West Transmission Line was put into service in 1912-1913 to carry 150kV from the Big Creek Hydroelectric System in the Sierra National Forest northeast of Fresno to the Eagle Rock Substation in Los Angeles. The purpose of the 241-mile transmission line was to convey electricity from the powerhouses at Big Creek to Los Angeles for distribution to SCE service territories (Tinsley Becker et al 2012). The East and West lines were upgraded in 1922-1923 to carry 220kV, doubling the capacity of the lines (Pomona Progress 1922). In May 1923, the last span of the 241-mile 220kV transmission line was tied in, touted as being "the world's greatest achievement in long distance, high voltage transmission." (The Bulletin 1923). SCE continued to develop the Big Creek Hydroelectric System into the 1920s with the construction of dams, reservoirs, powerhouses, rail lines, and tunnels. Additionally, updates were made to the existing East and West Transmission Lines, with new lines installed to convey electricity between Big Creek and Los Angeles.

"By 1930 the backbone of SCE's 66kv and 220kV system was fully developed and included the use of 220kV double-circuit towers and 66kV multi-circuit towers ranging from 4 to 14 circuits." (Tinsley Becker et al 2017). SCE continued to develop new tower types for its 220kV system into the 1930s, creating larger single- and double-circuit towers inspired by old designs. These designs became standard, 'off the shelf' tower types by the 1940s.

The identified period of significance for 66kV and below transmission lines is 1907-1930, which includes the construction of the Kern River-Los Angeles Transmission Line in 1907 through completion of the 66kV system by 1930 (Tinsley Becker et al 2017).

5.3 Wooden Distribution Lines

The use of wood pole support structures for electrical transmission or distribution lines represents borrowed technology from the telegraph transmission system, and the technology itself has changed little over time. Wood poles carry the electrical wires (with voltages 33kV and below) on cross arms or via a connection to their insulators. Given this lack of change in technology and appearance over time, it is difficult for a wooden distribution line to convey a particular period of significance in electrical infrastructure history, and by extension, to any significant themes and associations (Tinsley Becker et al. 2017, Williams 2023).

> The "typical" life of a wood pole transmission or distribution line structure is 50 years, although some last longer and others deteriorate much sooner. Wood pole supported transmission or distribution lines over 50 years of age usually lack original integrity of materials despite substantially retaining the look and feel of the original wood-pole transmission or distribution line. Replacement wood-poles or hardware parts, therefore, can continue the utilitarian historic fabric representative of the original potentially historic transmission or distribution line structures because of the lack of any distinct engineering or architectural attributes. The common and indistinctive nature of wood-pole transmission or distribution line structures disqualify them as potentially National Register eligible. They are purely functional and utilitarian in use and common in appearance (Tinsley Becker et al. 2017:64).

6 Identified Resources

6.1 Santiago Dam Complex (P-30-176757)

6.1.1 Property Description

The Santiago Dam Complex consists of the various dam components (i.e., the dam, spillway, outlet tower), reservoir, and associated structures, including the Dam Keeper's Residence and Garage, Storage Shed, Second Garage, Control Building and Valve Vault, Boat Dock, and the OCWR Landfill Flare Facility which sits above the dam on a ridge to the west. All of these elements are numbered on the APE Map and referenced throughout the discussion below (Figure 2).

Dam Components

The Santiago Dam is an earthen and concrete structure constructed in 1931 (Exhibit 1) (APE Map #1). It contains 1.1 million cubic yards of clay, porous clay and rock that was moved in for its construction. The upstream portion of the dam was filled with clay material to prevent water seepage and has a 2.5 to 1 slope and is capped with concrete blocks that measure six feet by 6 inches thick (Exhibit 2). The Irvine Lake (also called the Santiago Creek Reservoir) has a storage capacity of approximately 25,000-acre feet of water. The Dam's footprint features a gentle "S" curve, with a concrete spillway at its west end (APE Map #2). Eight narrow pylons support a 12-foot-wide concrete catwalk that extends over the spillway (Exhibit 3). Safety railings for the catwalk are provided by 4-foot-high concrete parapets (Exhibit 4). An outlet tower is located southwest of the spillway (Castells 2021)(APE Map #3).

Exhibit 1: South elevation of Santiago Dam and view of Irvine Lake, view north (Psomas 2023)

Exhibit 2: South elevation of Santiago Dam, view west (Psomas 2023)

Exhibit 3: North elevation of Santiago Dam and outlet tower, view southwest (Psomas 2023)

Exhibit 4: View of Santiago Dam concrete spillway, view north (PaleoWest 2021)

Exhibit 5: View of Santiago Dam concrete spillway, view north (Psomas 2023)

Associated Buildings and Structures

Dam Keeper Residence and Garage

The Dam Keeper Residence and Garage were constructed in 1931 and are visible in the 1938 historic aerial photograph (APE Map #7, #8). The Dam Keeper Residence is a one-story, single-family residence located on a hill east of the dam with a front gabled roof clad in composition shingles (Exhibit 6). The residence is clad in vertical clapboard siding. The primary elevation faces south and features a covered porch located under a secondary front gabled roof (Exhibit 7). There are three replaced single-hung windows at the primary elevation. The west elevation consists of a screened porch that extends almost the entire width of the building. The porch cantilevers over the hill and provides a full view of the dam (Exhibit 8).

Directly south of the residence, across the asphalt paved driveway, is a two-car garage with a front facing gable clad with composition shingles (APE Map #9). The building features narrow, horizontal wood siding and north facing primary elevation. The garage does not have a door, rather the interior has been modified and sectioned off, now featuring a smaller room within the garage. Single hung windows are visible on the east, west, and south elevations (Exhibit 9).

Alterations to the Dam Keeper Residence include replacement of all original windows and siding. The siding may have been replaced in the 1980s, but the windows were likely replaced more recently.

Exhibit 6. Dam Keeper Residence and Garage, view north (Psomas 2023)

Exhibit 7. Dam Keeper Residence, primary south elevation, view north (Provided by Psomas: Moeder 2023)

Exhibit 8. Dam Keeper Residence, west elevation, view northeast (Psomas 2023)

Exhibit 9. Dam Keeper Garage, north elevation, view south (Psomas 2023)

Second Garage

A second garage is located approximately 190 feet south of the Dam Keeper Residence and Garage along an asphalt and gravel driveway (APE Map #9). Although it appears that other garages with smaller footprints were once located in the same vicinity, the current Second Garage first appears in a 2002 historic aerial. The garage is located at the base of hill. It has a rectangular floor plan and a front gabled roof clad in composition shingles. The Second Garage is clad in vertical clapboard siding and the main entrance is located on the north elevation. The garage door is a modern sectional door (Exhibit 10).

Exhibit 10. Second Garage, north elevation, view south (Psomas 2023)

Storage Shed

The Storage Shed is located above the dam spillway, approximately 55 feet to the east (APE Map #4). It appears in historic aerial photographs as early as 1947. It has a rectangular floor plan and a front gabled roof clad in composition shingles. The building is clad with vertical clapboard siding and features a contemporary sectional garage door (Exhibit 11).

Exhibit 11. Storage Shed, north elevation, view south (Psomas 2023)

OCWR Landfill Flare Facility

The OCWR Landfill Flare Facility is an industrial structure located approximately 266 feet southwest of the concrete catwalk, on the northwesternmost hillside adjacent to the reservoir (APE Map #6). It consists of three squared metal towers with metal catwalks that surround each tower on three elevations. The facility is made up of other industrial components such as tanks and pipes (Exhibit 12). It can be accessed via a private road stemming from Santiago Canyon Road.

Exhibit 12. OCWR Landfill Flare Facility, view southwest.

Control Building and Valve Vault

The Control Building and Valve Vault is located northeast of the spillway. It is located at the base of a hill and features a single-story building with a rectangular floor plan and front gabled roof (APE Map #5). The roof is clad with composition shingles and the building is clad with vertical wood siding. A single door is located on the east elevation and a sectional garage door is located on the south elevation. A chain linked fence is located east of the building surrounding a small shed building (Exhibit 13). The building is isolated and there is a road to its east that extends east before it travels north connecting to State Road 241.

Exhibit 13. Control Building and Valve Vault, south and east elevations, view northwest (Psomas 2023)

Boat Dock

The boat dock is not permanently attached or anchored to the lakeshore. It currently sits on the southwest end of the lake and is a rectangular dock with a shed (APE Map #10). The dock measures approximately 193 feet long and 18 feet wide.

6.1.2 Construction History

The land surrounding the current site of the Santiago Dam Complex was used during the 19th and early 20th century for cattle and sheep grazing. Beginning in 1876, the Serrano Irrigation District provided water for citrus groves in the Orange and Villa Park areas. By the late 1920s, the demand for irrigation water intensified and required the construction of a reservoir (Serrano Irrigation District n.d.).

At the request of the Serrano and Irvine Irrigation Districts, bids for a contractor for the new construction of the Santiago Dam began in early 1931. The lowest bidder, R.G. Letourneau Company Inc., won the contract at the value of $507,721.50 which was well below the engineer's estimate of $725,000 (LAT 1931). Augustus Kempkey was the consulting engineer on the project. The dam was a "earth fill" type which was constructed to be 125 feet high above the Santiago Creek bed, 600 feet through the base and narrowing to 10 feet at the top. The dam was 1,400 feet long and could accommodate approximately 25,000-acre feet of water. The Wheatland Construction Company placed

all the steel and concrete on the dam including 400 tons of steel and 7,000 cubic yards of concrete; the spillway required an additional 400 tons of reinforcing steel and 5,000 yards of concrete (Whittier News 1931). The dam was completed in 1931 and its reservoir, Irvine Lake, was filled by 1933. The lake opened to the public in 1941 (Orange County Grand Jury 2018-2019). A dam keeper residence was added in 1931 and was located on the east end of the dam (Santa Ana Register 1932).

Exhibit 14: Base of outlet tower circa 1931 (Courtesy of IRWD)

Exhibit 15: Outlet tower under construction circa 1931 (Courtesy of IRWD)

Exhibit 16: Spillway crest and chute under construction circa 1931 (Courtesy of IRWD)

Exhibit 17: Santiago Dam and outlet tower under construction circa 1931 (Courtesy of IRWD)

Review of historic aerial photographs indicates that the dam has always been located in a mountainous, undeveloped area. In the earliest photograph dating from 1931, Santiago Creek was visible but the dam was not yet in place (UCSB 1931). The Dam, Dam Keeper's Residence, and Dam Keeper's Garage were visible in the 1938 historic aerial as well as the Storage Shed. By 1947, the boat dock was visible at the south end of Irvine Lake for recreational purposes (UCSB 1938, 1947). The Control Building and Valve Vault appears in the 1960 aerial approximately 400 feet northeast of the spillway. By 1977, a parking lot has been added near the dock, presumably for those making use of recreational activities at the lake (UCSB 1977). Grading of the hills west of the dam appears to begin circa 1969, expands in 1977, and is visibly larger by 1989 (UCSB 1989). The location of the parking lot and dock appear to move several times throughout the years. Aerial photographs show water levels were low between 2016 and 2020 and the dock was moved further north along the western bank presumably to deeper water. the OWCR Landfill Flare Facility first appears in the 2002 historic aerial, located west of the dam, and is still present today (UCSB 2002).

Review of historic architectural drawings show that in 1956 a pipeline connecting Metropolitan Water District and Santiago Dam was constructed (Santiago Creek Dam Drawings 1956). A spillway overflow recorder was added in 1957 by Boyle Engineering (Santiago Creek Dam Drawings 1957). In 1969 Leeds, Hill, and Jewett Inc. were the consulting engineers on record that designed a series of updates on the dam including embankment construction, spillway reconstruction and reinforcement, and outlet works

reconstruction (Santiago Creek Dam Drawings 1959). An extension of the water tower was completed in 2001 by Cho Design Associates, Inc. The drawing set consists of three sheets and does not indicate the level of work proposed. The drawing set included cover sheet, sheet index, and as-built information (Santiago Creek Dam Drawings 2001). In 2003, Verizon added a cellphone tower near the dam (Santiago Creek Dam Drawings 2003).

6.1.3 Engineer: Augustus Kempkey (c. 1885-1975)

Augustus Kempkey was a native of Oakland and graduated from the University of California in 1902. Upon graduation, he worked as assistant engineer for the Berkeley branch of the Contra Costa Water Works (Oakland Tribune 1902). He belonged to a number of Masonic bodies and was the grand commander of California Knights of Templar in 1938. He worked as a consulting civil engineer (Sacramento Bee 1975). Through archival research Kempkey appeared to work as a consultant very early in his career for various agencies. He worked on projects such as the Patterson irrigation system, Turlock irrigation project, Modesto irrigation project, and Brentwood irrigation project. Most of his work was on at advisory level. Other dams he worked on include Conn Dam and Lake Hodges Dam.

6.2 Taiwan 12kV Overhead Distribution Line

The Taiwan 12kV wooden overhead distribution line was first energized in c. 1952 (Communication with SCE). SCE has no original drawings or other information pertaining to the line's construction.

The Taiwan 12kV line runs as far north as the Windy Ridge Toll Plaza on State Road 241 (Eastern Transportation Toll Road); as far east as the intersection of Blackstar Canyon Road and State Spur Road; as far south as intersection of Black Star Canyon Road, Silverado Canyon Road, and Santiago Canyon Road; and as far west as East Chapman Avenue, just west of South Rancho Santiago Road. The line is mostly concentrated in a housing development bounded by East Chapman Avenue and Canyon View Avenue to the west, east Chapman Avenue to the north, Jamboree Road to the east, and Canyon View Avenue to the south.

The Taiwan line interests the project boundary at the northern and southern borders. To the north, the line runs east to west from the spillway to the Dam Keeper's Residence and is located just north of the spillway. To the south, the line intersects the project boundary at three different points running north to south.

Exhibit 18. Taiwan 12kV Overhead Distribution Line, view north (Psomas 2023)

7 Significance Evaluation

7.1 Santiago Dam Complex (P-30-176757)

7.1.1 NRHP, CRHR, and County Designation Criteria

The Santiago Dam appears to remain eligible for the NRHP, CRHR, and local landmark designation based on the following application of designation criteria and integrity requirements.

NRHP Criterion A. That are associated with events that have made a significant contribution to the broad patterns of our history.

CRHR Criterion 1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

Santiago Dam is directly associated with events that made significant contributions to the development of the citrus industry in Orange County in the late 19th and early 20th century with a period of significance of 1931, when the dam was built. The subject property was constructed by the Serrano Irrigation District, John T. Carpenter Water Company, and the Irvine Company. Prior to construction on the dam, farmers dug wells, built reservoirs, and laid pipelines to irrigate their crops. Water quality and water scarcity prompted a change in water distribution and the installation of wells. Water runoff and irrigation rights were a constant struggle between the Irvine, Carpenter, and Serrano Irrigation Districts. The dispute between the three districts was resolved when they came together to construct the Santiago Dam. The Dam provided water for domestic and agricultural uses and is directly related to the development of the citrus industry in Orange County during the late 19th and early 20th century.

The Santiago Dam, including the dam, outlet tower, spillway, and reservoir, is directly associated with the historical and current function of the Dam. Although the Dam Keeper's Residence and Garage appear to have been constructed around the same time as the Dam, their significantly altered appearance makes them unrecognizable from the period of significance of the Dam. The remaining features within the Dam complex such as the Storage Shed, Second Garage, Control Building and Valve Vault, Boat Dock, and OCWR Landfill Flare Facility are non-contributing features constructed outside the period of significance of the Dam.

Therefore, the Santiago Dam Complex is eligible under NRHP Criterion A and CRHR Criterion 1 for its important contributions to local water and agricultural history.

NRHP Criterion B. That are associated with the lives of persons significant in our past.

CRHR Criterion 2. Is associated with the lives of persons important in our past.

The subject property is a dam constructed by the John T. Carpenter Water Company, Serrano Irrigation District, and the Irvine Company. Review of local publications and newspaper articles failed to indicate that the subject property has any important associations with significant persons in regional history. Therefore, the subject property is not eligible under NRHP Criterion B or CRHR Criterion 2.

NRHP Criterion C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

CRHR Criterion 3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

The Santiago Dam is an earthen and concrete structure constructed in 1931. Although Augustus Kempkey appears to have consulted on numerous water projects throughout California, he does not appear to have been a master engineer when considered among others in his field. Further, the Santiago Dam is an earthen embankment dam, the most common type of dam in the United States; they can be built from locally available materials that require minimal processing, saving money on the construction process. The Dam does not possess high artistic value or innovative engineering features. Therefore, the Santiago Dam is not eligible under NRHP Criterion C or CRHR Criterion 3.

NRHP Criterion D. That have yielded, or may be likely to yield, information important in prehistory or history.

CRHR Criterion 4. Has yielded, or may be likely to yield, information important in prehistory or history.

The subject property is not significant as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials or technologies. Therefore, the subject property is not eligible under NRHP Criterion D or CRHR Criterion 4.

7.1.2 Integrity

Location: The subject property retains integrity of location as it remains in its current location.

Design: The subject property has integrity of design. Although there have been a few alterations, the design of the Dam remains relatively unchanged.

Setting: The subject property has integrity of setting. The Dam is still located in an undeveloped rural setting.

Materials: The subject property retains integrity of materials as the dam and spillway retain original materials.

Workmanship: The subject property retains integrity of workmanship as evidence of the original craftsmanship is present.

Feeling: The subject property retains integrity of feeling as the area remains undeveloped and rural.

Association: The subject property continues to be associated with the distribution of water for agricultural and domestic use.

The Santiago Dam is eligible for listing under NRHP and CRHR under Criterion A/1.

7.2 Taiwan 12kV Overhead Distribution Line

The Taiwan 12kV Overhead Distribution Line is not eligible for the NRHP, CRHR, and local landmark designation based on the following application of designation criteria and integrity requirements.

NRHP Criterion A. That are associated with events that have made a significant contribution to the broad patterns of our history.

CRHR Criterion 1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

Guidance provided in Tinsley Becker et al. 2015 states that subtransmission lines and their associated infrastructure should be evaluated under two important themes, which are most appropriately examined below under Criteria A/1/2:

(1) An association with and representation of SCE's organizational history as evidence of key expansion periods that contributed to or served as the genesis of settlement or marked growth in community services by SCE.

The Taiwan 12kV Overhead Distribution line was energized c. 1952. Information regarding the construction of the line is limited. The design for distribution lines was borrowed from telegraph transmission technology and uses infrastructure that is found state-wide. The principles of the design of distribution systems is rudimentary with minor changes since its inception and is unable to reflect significance from the period from which they were constructed

(2) An association with SCE's original construction and implementation campaigns or the established period of significance for the company's 66kV, 220kV, and 500kV systems.

The Taiwan 12kV Overhead Distribution line is not associated with SCE's early construction and implementation campaigns, nor does it fall within the period of significance for either SCE's 66kV, 220kV, or 500kV systems.

For the reasons demonstrated above, the subject property is not eligible under NRHP Criterion A or CRHR Criterion 1,

NRHP Criterion B. That are associated with the lives of persons significant in our past.

CRHR Criterion 2. Is associated with the lives of persons important in our past.

The subject property is a transmission line that is not associated with any specific owners. Its only owners have been SCE. Review of local publications and newspaper articles failed to indicate that the subject property has any important associations with significant persons in regional or SCE history. Therefore, the subject property is not eligible under NRHP Criterion B, CRHR Criterion 2, or County Criterion 3.

NRHP Criterion C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

CRHR Criterion 3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

The Taiwan 12kV Overhead Distribution Line does not serve as an important example of electrical infrastructure on SCE's system. Under this criterion, wood poles are considered ubiquitous and indistinctive utilitarian structures that are purely functional and do not exhibit any important construction methods or technologies. Further, the line is not an early example of electrical voltage or transmission technology and does not represent an innovation in engineering design or for construction material technology. Therefore, the subject line is not eligible under NRHP Criterion C or CRHR Criterion 3.

NRHP Criterion D. That have yielded, or may be likely to yield, information important in prehistory or history.

CRHR Criterion 4. Has yielded, or may be likely to yield, information important in prehistory or history.

The subject property is not significant as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials, or technologies. Therefore, the property is not eligible under NRHP Criterion D or CRHR Criterion 4.

7.2.1 Integrity

Location: The subject property retains integrity of location as it remains in its current location.

Design: The subject property has integrity of design. Although there have been a few alterations, the design of the dam and spillway remain unchanged.

Setting: The subject property has integrity of setting. The line continues to be located in an undeveloped rural setting.

Materials: The subject property appears to retain integrity of materials as they do not appear to have been replaced.

Workmanship: The subject property retains integrity of workmanship as evidence of the original craftsmanship is present.

Feeling: The subject property retains integrity of feeling as the presence of wood poles help it retain a circa 1952 feeling.

Association: The subject property has no important associations with any patterns of regional development or SCE organization history and falls outside the period of significance for 66kV electrical transmission.

The Taiwan 12kV Overhead Distribution line is not eligible for listing under NRHP and CRHR under any designation criteria.

8 Project Effects/Impacts Assessment

8.1 Historic Properties Identified

One historic property/historical resource was identified within the project APE: the Santiago Dam Complex (P-30-176757), which currently has a status code of 2S2, indicating it has been determined eligible for the NRHP and is listed in the CRHR. The updated evaluation completed as part of the current study found that the Dam remains eligible for the NRHP/CRHR under Criterion A/1. The Dam is eligible for its important historical associations with water resources development in Orange County, as well as with the citrus agriculture industry. Therefore, it is necessary to consider the proposed project's potential to adversely affect this historic property/historical resource.

8.2 Application of the Criteria of Adverse Effect

As stated in 36 CFR 800.5(a)(1), Criteria of adverse effect:

> An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the NRHP in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the NRHP. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative.

Examples of adverse effects on historic properties include, but are not limited to (36 CFR 800.5(a)(2)):

(i) Physical destruction of or damage to all or part of the property;

(ii) Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary's standards for the treatment of historic properties (36 CFR part 68) and applicable guidelines;

(iii) Removal of the property from its historic location;

(iv) Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;

(v) Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features;

(vi) Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization; and

(vii) Transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

8.3 Physical Effects of the Proposed Project

The following project-related physical effects were identified for the Santiago Dam Complex (P-30-176757):

- Demolition of the existing outlet tower, spillway, and portions of the upstream Dam embankment concrete facing
- Construction of a new spillway
- Widening and raising of the Dam crest
- Construction of a new 1.5-foot-tall concrete parapet wall on the upstream side of the Dam
- Construction of a 10-foot-tall, 1,300-foot-long retaining wall on the downstream face of the Dam
- Construction of a new emergency access walkway and stair system
- Construction of a new steel bridge structure

8.4 Analysis of Potential Adverse Effects

The major components of the Santiago Dam Complex include the dam, spillway, outlet tower, and reservoir, as these elements are directly associated with the historical and current function of the resource. However, the Dam is not eligible for its engineering or construction techniques, and it is not the specifics of the Dam's design or individual elements that make it eligible for the NRHP/CRHR under Criterion A/1. Rather, it is the Dam's ongoing function and location that conveys its historical associations with Orange County water development and the citrus industry. Although the proposed project will result in the loss of some original historic materials, design, and workmanship associated with the spillway and outlet tower, the loss of these elements will not prevent the Dam from conveying its important historical associations. The same is true for proposed alterations to the Dam crest. Although specific aspects of the Dam will be modified, it will remain recognizable as an earthen embankment dam and will continue to perform the historic function for which it is eligible. The character-defining features of the Dam necessary for it to continue to convey its historical significance under Criterion A/1 include its ongoing function as an earthen embankment dam on Santiago Creek, maintaining the same general massing and scale. Therefore, the proposed project will result in no adverse effects to historic properties under Section 106 of the NHPA, and no significant impacts to historical resources under CEQA.

9 Findings

One historic property/historical resource was identified within the project APE: the Santiago Dam Complex (P-30-176757), which currently has a status code of 2S2, indicating it has been determined eligible for the NRHP and is listed in the CRHR. The updated evaluation completed as part of the current study found that the Dam remains eligible for the NRHP/CRHR under Criterion A/1. The Dam is eligible for its important historical associations with water resources development in Orange County, as well as with the citrus agriculture industry.

Although specific aspects of the Dam will be modified, it will remain recognizable as an earthen embankment dam and will continue to perform the historic function for which it is eligible. The character-defining features of the Dam necessary for it to continue to convey its historical significance under Criterion A/1 include its ongoing function as an earthen embankment dam on Santiago Creek, maintaining the same general massing and scale. Therefore, the proposed project will result in no adverse effects to historic properties under Section 106 of the NHPA, and no significant impacts to historical resources under CEQA.

***P3a. Description (Continued):**

Dam Components

The Santiago Dam is an earthen and concrete structure constructed in 1931 (Exhibit 1) (APE Map #1). It contains 1.1 million cubic yards of clay, porous clay and rock that was moved in for its construction. The upstream portion of the dam was filled with clay material to prevent water seepage and has a 2.5 to 1 slope and is capped with concrete blocks that measure six feet by 6 inches thick (Exhibit 2). The Irvine Lake (also called the Santiago Creek Reservoir) has a storage capacity of approximately 25,000-acre feet of water. The Dam's footprint features a gentle "S" curve, with a concrete spillway at its west end (APE Map #2). Eight narrow pylons support a 12-foot-wide concrete catwalk that extends over the spillway (Exhibit 3). Safety railings for the catwalk are provided by 4-foot-high concrete parapets (Exhibit 4). An outlet tower is located southwest of the spillway (Castells 2021)(APE Map #3).

Exhibit 5: View of Santiago Dam concrete spillway, view north (Psomas 2023)

Associated Buildings and Structures

Dam Keeper Residence and Garage

The Dam Keeper Residence and Garage were constructed in 1931 and are visible in the 1938 historic aerial photograph (APE Map #7, #8). The Dam Keeper Residence is a one-story, single-family

residence located on a hill east of the dam with a front gabled roof clad in composition shingles (Exhibit 6). The residence is clad in vertical clapboard siding. The primary elevation faces south and features a covered porch located under a secondary front gabled roof (Exhibit 7). There are three replaced single-hung windows at the primary elevation. The west elevation consists of a screened porch that extends almost the entire width of the building. The porch cantilevers over the hill and provides a full view of the dam (Exhibit 8).

Directly south of the residence, across the asphalt paved driveway, is a two-car garage with a front facing gable clad with composition shingles (APE Map #9). The building features narrow, horizontal wood siding and north facing primary elevation. The garage does not have a door, rather the interior has been modified and sectioned off, now featuring a smaller room within the garage. Single hung windows are visible on the east, west, and south elevations (Exhibit 9).

Alterations to the Dam Keeper Residence include replacement of all original windows and siding. The siding may have been replaced in the 1980s, but the windows were likely replaced more recently.

Exhibit 6. Dam Keeper Residence and Garage, view north (Psomas 2023)

Exhibit 7. Dam Keeper Residence, primary south elevation, view north (Provided by Psomas: Moeder 2023)

Exhibit 8. Dam Keeper Residence, west elevation, view northeast (Psomas 2023)

Exhibit 9. Dam Keeper Garage, north elevation, view south (Psomas 2023)

Second Garage

A second garage is located approximately 190 feet south of the Dam Keeper Residence and Garage along an asphalt and gravel driveway (APE Map #9). Although it appears that other garages with smaller footprints were once located in the same vicinity, the current Second Garage first appears in a 2002 historic aerial. The garage is located at the base of hill. It has a rectangular floor plan and a front gabled roof clad in composition shingles. The Second Garage is clad in vertical clapboard siding and the main entrance is located on the north elevation. The garage door is a modern sectional door (Exhibit 10).

Exhibit 10. Second Garage, north elevation, view south (Psomas 2023)

Storage Shed

The Storage Shed is located above the dam spillway, approximately 55 feet to the east (APE Map #4). It appears in historic aerial photographs as early as 1947. It has a rectangular floor plan and a front gabled roof clad in composition shingles. The building is clad with vertical clapboard siding and features a contemporary sectional garage door (Exhibit 11).

Exhibit 11. Storage Shed, north elevation, view south (Psomas 2023)

OCWR Landfill Flare Facility

The OCWR Landfill Flare Facility is an industrial structure located approximately 266 feet southwest of the concrete catwalk, on the northwesternmost hillside adjacent to the reservoir (APE Map #6). It consists of three squared metal towers with metal catwalks that surround each tower on three elevations. The facility is made up of other industrial components such as tanks and pipes

(Exhibit 12). It can be accessed via a private road stemming from Santiago Canyon Road.

Exhibit 12. OCWR Landfill Flare Facility, view southwest.

Control Building and Valve Vault

The Control Building and Valve Vault is located northeast of the spillway. It is located at the base of a hill and features a single-story building with a rectangular floor plan and front gabled roof (APE Map #5). The roof is clad with composition shingles and the building is clad with vertical wood siding. A single door is located on the east elevation and a sectional garage door is located on the south elevation. A chain linked fence is located east of the building surrounding a small shed building (Exhibit 13). The building is isolated and there is a road to its east that extends east before it travels north connecting to State Road 241.

Exhibit 13. Control Building and Valve Vault, south and east elevations, view northwest (Psomas 2023)

Boat Dock

The boat dock is not permanently attached or anchored to the lakeshore. It currently sits on the southwest end of the lake and is a rectangular dock with a shed (APE Map #10). The dock measures approximately 193 feet long and 18 feet wide.

Construction History

The land surrounding the current site of the Santiago Dam Complex was used during the 19th and early 20th century for cattle and sheep grazing. Beginning in 1876, the Serrano Irrigation District provided water for citrus groves in the Orange and Villa Park areas. By the late 1920s, the demand for irrigation water intensified and required the construction of a reservoir (Serrano Irrigation District n.d.).

At the request of the Serrano and Irvine Irrigation Districts, bids for a contractor for the new construction of the Santiago Dam began in early 1931. The lowest bidder, R.G. Letourneau Company Inc., won the contract at the value of $507,721.50 which was well below the engineer's estimate of $725,000 (LAT 1931). Augustus Kempkey was the consulting engineer on the project. The dam was a "earth fill" type which was constructed to be 125 feet high above the Santiago Creek bed, 600 feet through the base and narrowing to 10 feet at the top. The dam was 1,400 feet long and could accommodate approximately 25,000-acre feet of water. The Wheatland Construction Company placed all the steel and concrete on the dam including 400 tons of steel and 7,000 cubic yards of concrete; the spillway required an additional 400 tons of reinforcing steel and 5,000 yards of concrete (Whittier News 1931). The dam was completed in 1931 and its reservoir, Irvine Lake, was filled by 1933. The lake opened to the public in 1941 (Orange County Grand Jury 2018-2019). A dam keeper residence was added in 1931 and was located on the east end of the dam (Santa Ana Register 1932).

Exhibit 14: Base of outlet tower circa 1931 (Courtesy of IRWD)

Exhibit 15: Outlet tower under construction circa 1931 (Courtesy of IRWD)

Exhibit 16: Spillway crest and chute under construction circa 1931 (Courtesy of IRWD)

Exhibit 17: Santiago Dam and outlet tower under construction circa 1931 (Courtesy of IRWD)

Review of historic aerial photographs indicates that the dam has always been located in a mountainous, undeveloped area. In the earliest photograph dating from 1931, Santiago Creek was visible but the dam was not yet in place (UCSB 1931). The Dam, Dam Keeper's Residence, and Dam Keeper's Garage were visible in the 1938 historic aerial as well as the Storage Shed. By 1947, the boat dock was visible at the south end of Irvine Lake for recreational purposes (UCSB 1938, 1947). The Control Building and Valve Vault appears in the 1960 aerial approximately 400 feet northeast of the spillway. By 1977, a parking lot has been added near the dock, presumably for those making use of recreational activities at the lake (UCSB 1977). Grading of the hills west of the dam appears to begin circa 1969, expands in 1977, and is visibly larger by 1989 (UCSB 1989). The location of the parking lot and dock appear to move several times throughout the years. Aerial photographs show water levels were low between 2016 and 2020 and the dock was moved further north along the western bank presumably to deeper water. the OWCR Landfill Flare Facility first appears in the 2002 historic aerial, located west of the dam, and is still present today (UCSB 2002).

Review of historic architectural drawings show that in 1956 a pipeline connecting Metropolitan Water District and Santiago Dam was constructed (Santiago Creek Dam Drawings 1956). A spillway overflow recorder was added in 1957 by Boyle Engineering (Santiago Creek Dam Drawings 1957). In 1969 Leeds, Hill, and Jewett Inc. were the consulting engineers on record that designed a series of updates on the dam including embankment construction, spillway reconstruction and reinforcement, and outlet works reconstruction (Santiago Creek Dam Drawings 1959). An extension of the water tower was completed in 2001 by Cho Design Associates, Inc. The drawing set consists of three sheets and does not indicate the level of work proposed. The drawing set included cover sheet, sheet index, and as-built information (Santiago Creek Dam Drawings 2001). In 2003, Verizon added a cellphone tower near the dam (Santiago Creek Dam Drawings 2003).

Engineer: Augustus Kempkey (c. 1885-1975)

Augustus Kempkey was a native of Oakland and graduated from the University of California in 1902. Upon graduation, he worked as assistant engineer for the Berkeley branch of the Contra Costa Water Works (Oakland Tribune 1902). He belonged to a number of Masonic bodies and was the grand commander

of California Knights of Templar in 1938. He worked as a consulting civil engineer (Sacramento Bee 1975). Through archival research Kempkey appeared to work as a consultant very early in his career for various agencies. He worked on projects such as the Patterson irrigation system, Turlock irrigation project, Modesto irrigation project, and Brentwood irrigation project. Most of his work was on at advisory level. Other dams he worked on include Conn Dam and Lake Hodges Dam.

***B10. Significance (Continued):**

Historic Context

The following historic context is adapted from Donovan-Boyd, Kaiser, and Murray 2021.

Rancho Lomas de Santiago

Extensive land grants or ranchos were established in the interior during the Mexican period (1822-1848), in part to increase the population inland from the more settled coastal areas where the Spanish first concentrated their colonization efforts. The APE is located in Ranchos Lomas de Santiago, originally owned by José Antonio Yorba's youngest son, Teodocio Yorba. Yorba was granted Rancho Lomas de Santiago (Ranch of the Hills of St. James) in 1846, just before California was annexed to the United States at the end of the Mexican American War. The Yorba family was one of the most successful landowners in Southern California during the Mexican Period. Beginning in the 1840s and 1850s, the Yorba family had acquired six adjoining ranchos (Nelson 2009:2). Yorba filed a United States claim for the Rancho Lomas de Santiago in 1852.

Teodosio Yorba sold Rancho Lomas de Santiago to William Wolfskill in 1860 for $7,000 and Joseph E. Pleasants took charge of Wolfskill's new cattle operations. Already overgrazed, and largely unfarmable due to its steep, hilly terrain, the Santa Ana range could not sustain large cattle herds. In 1866, Benjamin and Thomas Flint, Llewellyn Bixby and James Irvine acquired the rancho from Wolfskill, and it eventually became part of the Irvine Ranch (Irvine Historical Society 2020).

Development of the Irvine Ranch

The APE is located in the northern portion of what would become known as the Irvine Ranch, one of the largest, most prosperous agricultural operations in Orange County. William Wolfskill purchased the land that would become the Irvine Ranch from Teodocio Yorba in c. 1860 with plans to use the land for grazing sheep (Nelson 2009:2). Wolfskill was a California pioneer, and a prolific landowner, businessman, and rancher. He is also credited with being one of California's first Valencia orange ranchers (OCHC 1983: Section 8). In 1866, Wolfskill sold the 47,000-acre property to Benjamin and Thomas Flint, Llewellyn Bixby, and James Irvine (Irvine Historical Society 2020). Flint and Bixby were also sheep men, who were expanding their land holdings to increase their annual production of wool (Nelson 2009:2).

James Irvine, a pioneer of California agriculture and prosperous San Francisco merchant, purchased the Flint and Bixby shares of the Rancho Lomas Santiago in 1876 for $150,000 dollars. This gave Irvine control of approximately 110,000 acres of land in and around the Santa Ana Canyon (Nelson 2009:3). Irvine, an Irishman, came to America in 1846, and lived for a time in New York City. He came to California in 1849, to find his fortunes in the California Gold Rush. After working in the mines for several years, Irvine began selling merchandise to miners, and eventually established a successful market in San Francisco (The San Francisco Examiner 1886:3). James Irvine died in 1886, leaving his estate to his son, James Irvine Jr. George Irvine, James Irvine Sr.'s brother, managed the property until Irvine Jr. came into possession of the estate at the age of 25 (Nelson 2009:2; The Mail 1886:2).

When James Irvine Jr. took over the estate in 1892, he converted the ranch into an "increasingly modern, productive enterprise of field crops, grain and irrigated orchards," which was achieved by digging wells, building reservoirs, and laying pipeline to irrigate the crops (Nelson 2009:3). In 1893, Irvine Jr. began to divert water from Santiago Creek to an area known as "The Flats" where the property's new ranch house was located. Also, in the 1880s, Irvine Jr. began to lease land to tenant farmers. These farmers grew grain and bean crops that required minimal rainfall and little to no irrigation. Historic aerials from 1946 suggest the Project site was never brought under

agricultural use during the Irvine ownership. While the Project site does not appear to have been cultivated, the road through Santiago Canyon, along the Santiago Creek, that eventually becomes Santiago Canyon Road, is visible on the 1901 topographic map of the area in generally the same orientation as it found today.

The Irvine Company

In 1894, James Irvine Jr. incorporated the Ranch as the Irvine Company and became the company's first president (Brower 2013: xxi). One of James Irvine Jr's first acts as president was to donate 160 acres of land, that had long been a popular pioneer picnic spot, to the State Board of Supervisors. This donation, land northeast of Irvine Lake, became the Irvine Ranch Historic Park, which is now the oldest park in Orange County (OCHC 1983: section 8). Around this same time, in 1889, Orange County formed out of parts of Los Angeles County (Figure 3). When Orange County was formed, the Irvine Company owned almost one-fifth of the County's acreage.

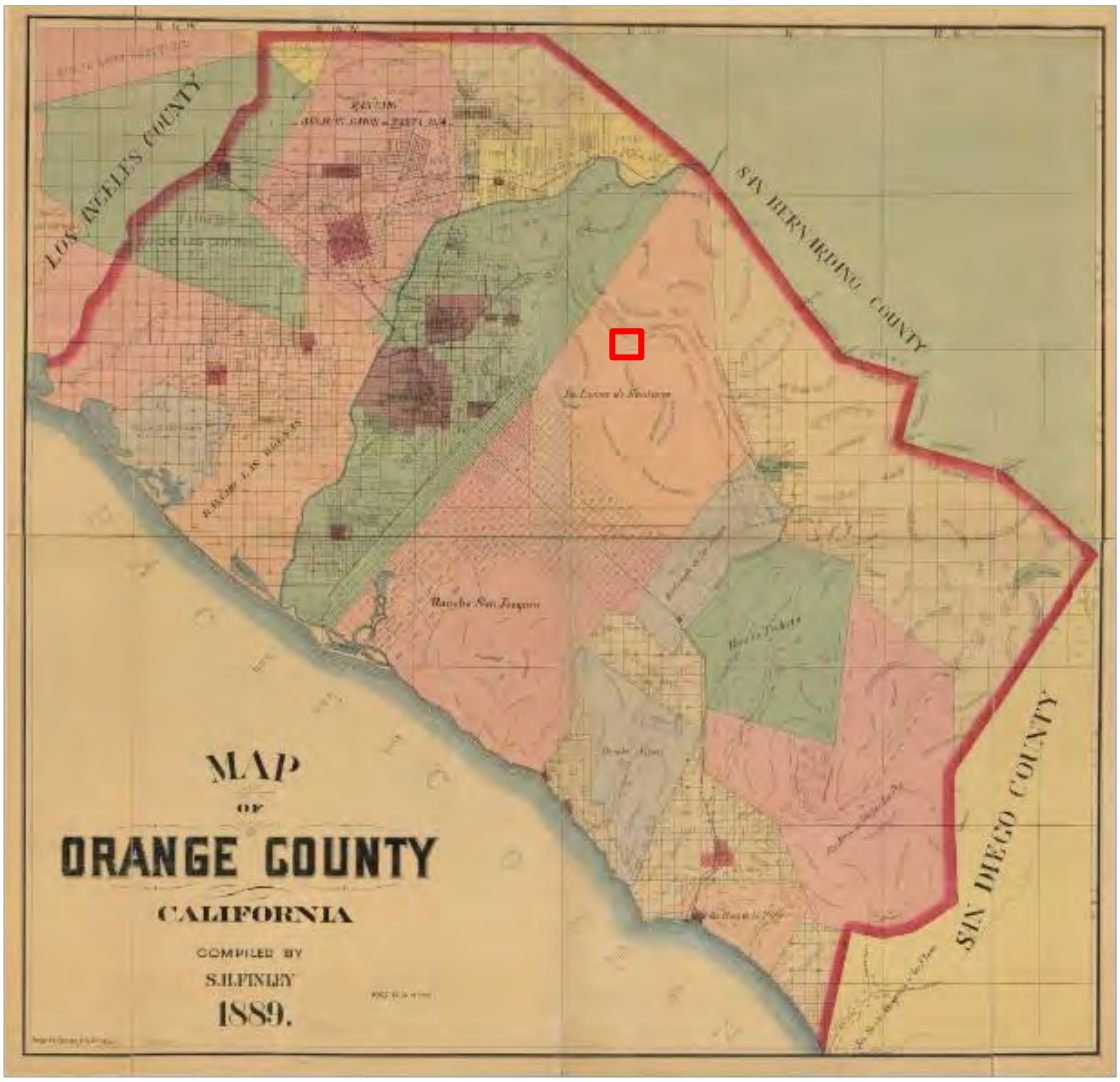

Figure 1. Orange County California Map, 1889. Shows the Ranchos and the growing population areas of Orange County. Compiled by S.H. Finley. Approximate Project Location in red (Library of Congress, Geography and Map Division) (Finley 1889).

Irvine Ranch quickly became one of the most productive tracts in California, known for the growing of lima beans, black-eyed peas, barley, oats, sugar beets, olives, walnuts, lemons, and oranges (Santa Ana Daily Register 1915:8). As the tenants on the Irvine Ranch increased, James Irvine Jr. developed an extensive system of wells to irrigate the land (Nelson 2009:7). By 1920, it is estimated that nearly 1,200 wells had been drilled on his acreage and many were running with electric pumps. By 1930, the Irvine Ranch had 31,000 acres of lima beans under cultivation, which was often described as the "largest lima bean field in the world" (Nelson 2009:7).
In 1935, James Irvine III (known as Jase), Irvine Jr.'s oldest son, tragically died of tuberculosis. Jase was on track to be the president of the Irvine Company and his death left James Irvine Jr. distraught and without sound leadership for the future of the company (Brower 2013: xxi). Several years later, in 1937, James Irvine Jr. established the James Irvine Foundation with 51% of the company's stock to be held by the foundation and the other 49% to be distributed to family (Brower 2013: xxii).

Irvine Ranch Water Management Facilities

Ongoing water quality problems and water scarcity made it clear that further work was necessary to irrigate crops at Irvine Ranch. The water conveyance facilities on the Ranch became one of the largest water management systems in Orange County. The first distribution irrigation feature on the Irvine Ranch property was the Irvine Ditch, constructed in 1893 from the Santiago Canyon to the Peters "Flats" (near the present-day location of the Peters Canyon Dam, which is approximately 2 miles to the west of the Project site). Wells were the primary source of water at the turn of the century, with 1,200 wells constructed in the area, most equipped with electric pumps. These wells allowed for large citrus orchards to be planted starting in 1906 (Nelson 2009: 17).

Irvine began to construct a series of winter water conservation features on the Ranch starting in the 1920s. Water runoff and irrigation rights were a constant struggle between the Irvine, Carpenter, and Serrano Irrigation Districts and the conservation projects were an effort to offset the marked decline in his groundwater system. P. R. Browning was the principal designer of all the Ranch's water conservation facilities except for the Santiago Dam which was designed by Augustus Kempkey (Nelson 2009:7). The dispute between the competing irrigation districts was eventually settled in 1928, with an agreement between the three litigants that led to the construction of the Santiago Dam and Outlet Tower (Nelson 2009:8). This period also saw the establishment of a massive irrigation system on the site (Brower 2013: xxi). In 1950, there were 4,550 irrigated acres and 33,430 dry farming acreage. Just ten years later, the Irvine company had increased the irrigated acreage to 7,417 acres and dry farming acres accounted for only 16,853 acres (Nelson 2009: 18).

County-wide flood control bonds failed to gather appropriate support in 1929 and 1931, leaving James Irvine Jr. to complete some large-scale water management projects without government support. Flood control created both land security and pooled runoff water for domestic and agricultural uses. Irvine was increasingly worried about water rights, and in 1932 he filed suit against upper basin users to protect the rights to the Santa Ana River (OCWD 2015: 24). The following water conservation projects were completed on the Irvine Ranch Site between 1929 and 1959: Lambert Reservoir (1929); Santiago Dam (1931); Irvine Conservation Dam (1932); Peters Canyon Dam (1931); the High Line Canal (1930s); Laguna Reservoir (1937-38); Bonita Reservoir (1937-38); Little Peters Reservoir (1940); Sand Canyon Reservoir (1942); Syphon (sometimes spelled Siphon) Canyon Dam (1948-49); and the Rattlesnake Canyon Reservoir (1959) (Nelson 2009:8). In 1970, the construction of the Irvine Lake Pipeline brought water from the Colorado River to the Rattlesnake Canyon Reservoir.

Consolidation of Orange County Water Districts

While the Irvine Ranch was creating a sophisticated water system for Ranch operations, the rest of Orange County was using a patchwork method of establishing water rights. Early water conveyance developments in Orange County generally organized as groups of property owners that banded together to provide water services through groundwater wells, these co-ops were called "mutuals." The mutuals sold shares of water to landowners based on the number of acres held by each property owner. As metropolitan areas grew it became clear that the current system, collections of property owners, would not be sufficient for the rapidly growing population in Orange County (MWDOC 2017).

In 1928, several southern Orange County cities banded together to form the Metropolitan Water District of Southern California (MWD) with the lofty goal of importing water from the Colorado River. The MWD succeeded in the planning and construction of the Colorado River Aqueduct, which, starting in 1939, brought water from the Colorado River near the Arizona border to the east side of the Santa Ana Mountains. This ongoing consolidation of the cooperative system became a necessity as water became Southern California's most precious resource. In 1957, there were an estimated 151 of these mutual water groups remaining in Orange County. By 1963, it was estimated that by 1965, no more than 25 would remain. Postwar population growth further encouraged the consolidation of mutuals and districts and in other areas, growth brought city services within reach of previously rural areas (LAT 1963c:2).

The success of the MWD, and the continued need for more water lead to the formation of several other large districts who hoped to tap into Colorado River water as well as Northern California water from the State Water Project. Developments continued into the 1960s and 1970s to move water through areas in eastern Orange County. The Santiago lateral, completed in 1961, and the East Orange County Feeder Line No, 2, both extended water into the southeast section of the County (LAT 1961a: E:2; LAT 1961b: 52).

Irvine Ranch Water District

The IRWD was formed by the Irvine Company in 1961 as a California Special District with headquarters in Irvine. Orange County approved the boundaries of the District in December of 1960, with the District being bound on the west by Newport Avenue, the south by the Santa Ana Marine Corps Air Facility, the east by the Rancho Canada De Los Alisos, and the north by the Coastal Municipal Water District (LAT 1960: R-28cia). The District's boundaries initially included approximately 60 square miles (IRWD 2021: Liquid News). Initially, the IRWD served mainly agricultural customers, but the quickly growing Orange County population included many residential customers in need of water. The IRWD grew through annexations in the 1960s and 1970s and by 1991, the District provided water to one-sixth of Orange County (LAT 1991: A3).

As water districts became more established, growth continued through consolidation of districts. Between 1997 and 2008, the IRWD consolidated with five other water districts, including the South Coast Water District in 2006. Other districts that joined the IRWD include: Orange Park Acres Mutual Water Company (2008), Los Alisos Water District (2001), Carpenter Irrigation District (2000), and the Santa Ana Height Mutual Water Company in (1997) (IRWD 2021: Consolidations). Today the IRWD serves more than 425,000 residential customers and spans 181 square miles (IRWD 2021: Liquid News).

Serrano Irrigation District

The Serrano Irrigation District, now known as the Serrano Water District (SWD), was developed in 1876 by a consolidation of several water companies and associations privately-owned by ranchers and farmers in Villa Park. The Serrano Water Association, the John T. Carpenter Water District, and the Irvine Company came together in 1927 to form the Serrano Irrigation District as a public corporation under the Irrigation Districts Act of the State of California. "This enabled the district to hold elections to establish the bonds to finance their share of the construction of the Santiago Dam." (OAC n.d.). The Serrano Irrigation District was responsible for issuing bonds and borrowing money for the construction of the Santiago Dam and The Irvine Company provided the land (Serrano Irrigation District, Appendix A, n.d.).

In the early 1960s, the decrease in need for agricultural water led the district to build a water filtration plant and then later reservoirs at Sycamore and Taft to use water from the Irvine Lake for residential use (Serrano Irrigation District n.d.). Today, the district has 43 miles of pipe, three wells, two reservoirs, and one treatment plant. The district owns fifty percent of Irvine Lake and is the managing district for Irvine Lake (Serrano Water District 2023).

Post St. Francis Dam Disaster Development (1928-1947)

In 1928 the St. Francis Dam, located in the Santa Clara Valley just outside Los Angeles, failed, killing 430 people, destroying 1,250 buildings and 7,900 acres of farmland, to become one of the greatest dam failure disasters of the 20th century. Between 1929 and 1931, the State engineer

examined 827 dams and found near one third of them to require significant repairs according to new safety guidelines.

In 1929, the State of California also required any person that practices civil engineering or any of its branches to be registered with the state. This also included any person that acted in the position of an "assistant engineer" or higher. The state also created a board which developed standards for applicants that wanted to register with the state as an engineer. Some standards included: must be over 25 years of age, demonstrate no less than six years of professional experience, work references, and an application fee (Rogers n.d.).

Property Types

The following discussion of property types is adapted from Murray et al 2020:

Reservoir complexes, like Irvine Lake, are usually comprised of several elements including the water-retaining structure (dam), a water-retention area (reservoir), a water-releasing structure (spillway), a water-conveying structure (conduits and outlet tower), and other essential elements including water treatment plants (Zhang et al 2016). Each of these portions of the reservoir provides an essential function that ensures water will be retained and released safely.

Dams

The purpose of a dam is to store water and facilitate flood control for human and livestock water supply, irrigation, energy generation, recreation, and pollution control. Typically, dams fulfill a combination of these functions. Manmade dams are classified according to their type of construction, materials, slope, seepage control method, and resistance to the forces of water pressure. The materials used to construct modern dams included earth, rocks, concrete, masonry, steel, timber, rubber, and sometimes a combination of these materials. Dams can be classified into five basic types including embankment, concrete, gravity, buttress, and arch (ASDSO 2020).

Embankment Dams

Embankment dams are a type of massive dam that is built with natural materials, either rock or earth instead of concrete, leading to the sub-classification of earth-filled embankment dams and rock-filled embankment dams. The basic elements of embankment dams consist of a core, an earth- or rock-filled embankment on both sides, and protection on the upstream face. Embankment dams are trapezoidal in shape and resist the flow of water by both their strength and weight. Embankment dams can retain water because they have a low permeability throughout the structure or a layer of low-permeability material (Billington et al. 2005; TCEQ 2018).

Earth-filled Embankment Dams

Earth-filled embankment dams were the first type of dam to be constructed by humans and were first documented in approximately 3,000 BC in the Middle East. In fact, earth-filled embankment dams are still the most prevalent dam-type, and a 2005 report on large federal dams estimated that of the 70,000 dams present in the United States, 85% were earth-filled embankment dams. Many of the dams in the United States were built in the early twentieth century prior to the advent of technology that would have facilitated the construction of structural dams. However, the report goes on to say that throughout the twentieth century, even with the advent of new technology, 65% of the dams built were earth-filled embankment dams. Earth-filled dams are the most prevalent type of dam because they can be built from locally available materials that require minimal processing, saving money on the construction process. The main detraction from earth-filled dams is that they are subject to the erosive action of water if a sufficient spillway is not provided as part of the dam design (Billington et al. 2005; Bureau of Reclamation 1987). Examples of other earth-filled embankment dams in Orange County include:

- Peters Canyon Dam (1929)
- Villa Park Dam (1963)
- Seven Oaks Dam (1993)

Reservoirs
A reservoir is typically formed by the construction of a dam across a linear water source, such as a river or creek, to create an artificial lake where water is stored. The adjacent dam is responsible for the amount of water that flows out of the reservoir, therefore controlling its water level. The amount of water in a reservoir can also be controlled by natural elements including rainfall, snowfall, and droughts. In conjunction with storing water, reservoirs often become recreation centers for boating and fishing. The water in a reservoir is very still causing sediment to sink to the bottom which over time can reduce the total amount of water in the reservoir (NG 2020).

Spillways
A spillway is a structure used for the control of flood flows and diverting surplus water from a reservoir after it has been filled. The primary purpose of a spillway is to ensure water does not overtop the dam and destroy it. A controlled spillway manages flood water through the use of gates, where an uncontrolled spillway only utilizes the elevation of the spillway crest to control the water. The gates allow small amounts of water to be released to prevent a sudden large discharge of water which could cause the dam to fail. There are seven types of spillways including straight drop, ogee, shaft, chute, side channel, siphon, and labyrinth (PE 2019).

Outlet Towers
The outlet tower is a vertical structure located within the reservoir used for capturing water and conveying it to a hydroelectric or water-treatment plant. The tower sits above an outlet tunnel or pipe used to transport the water out of the reservoir which is controlled by the opening and closing of valves or gates. The value controls are usually located in a room at the top of the outlet tower (BDS 2020).

Secondary Property Types
Unlike the primary property types discussed above, secondary property types are not necessarily vital to keeping the reservoir complex running. Although secondary property types range greatly in their design and function, they are frequently associated with dam and reservoir sites. Examples of secondary property types include Dam Keeper's houses, cisterns and water tanks, pumping stations, wells, vaults, and any other components the larger water system built to support the reservoir complex.

- Dam Keeper's House: a small purpose-built cottage constructed to house the dam's keeper who moderated water levels in response to drought and heavy rain
- Cistern and Water Tank: an artificial reservoir, tank, or container used for the storing or holding of water on a dam site
- Pumping Station: Building(s) of this type can vary in size, their function is to house machinery that transport water from one site to another.
- Well: An excavation or structure created by digging, driving, or drilling to access water underground

Significance Evaluation
The following presents an evaluation of the subject property in consideration of NRH and CRHR designation criteria. Because of the similarities in the criteria of these programs, they have been addressed together to avoid duplicative text.

The Santiago Dam appears to remain eligible for the NRHP, CRHR, and local landmark designation based on the following application of designation criteria and integrity requirements.

NRHP Criterion A. That are associated with events that have made a significant contribution to the broad patterns of our history.

CRHR Criterion 1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

Santiago Dam is directly associated with events that made significant contributions to the development of the citrus industry in Orange County in the late 19th and early 20th century with a period of significance of 1931, when the dam was built. The subject property was constructed by the Serrano Irrigation District, John T. Carpenter Water Company, and the Irvine Company. Prior to construction on the dam, farmers dug wells, built reservoirs, and laid pipelines to irrigate their crops. Water quality and water scarcity prompted a change in water distribution and the installation of wells. Water runoff and irrigation rights were a constant struggle between the Irvine, Carpenter, and Serrano Irrigation Districts. The dispute between the three districts was resolved when they came together to construct the Santiago Dam. The Dam provided water for domestic and agricultural uses and is directly related to the development of the citrus industry in Orange County during the late 19th and early 20th century.

The Santiago Dam, including the dam, outlet tower, spillway, and reservoir, is directly associated with the historical and current function of the Dam. Although the Dam Keeper's Residence and Garage appear to have been constructed around the same time as the Dam, their significantly altered appearance makes them unrecognizable from the period of significance of the Dam. The remaining features within the Dam complex such as the Storage Shed, Second Garage, Control Building and Valve Vault, Boat Dock, and OCWR Landfill Flare Facility are non-contributing features constructed outside the period of significance of the Dam.

Therefore, the Santiago Dam Complex is eligible under NRHP Criterion A and CRHR Criterion 1 for its important contributions to local water and agricultural history.

NRHP Criterion B. That are associated with the lives of persons significant in our past.

CRHR Criterion 2. Is associated with the lives of persons important in our past.

The subject property is a dam constructed by the John T. Carpenter Water Company, Serrano Irrigation District, and the Irvine Company. Review of local publications and newspaper articles failed to indicate that the subject property has any important associations with significant persons in regional history. Therefore, the subject property is not eligible under NRHP Criterion B or CRHR Criterion 2.

NRHP Criterion C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

CRHR Criterion 3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

The Santiago Dam is an earthen and concrete structure constructed in 1931. Although Augustus Kempkey appears to have consulted on numerous water projects throughout California, he does not appear to have been a master engineer when considered among others in his field. Further, the Santiago Dam is an earthen embankment dam, the most common type of dam in the United States; they can be built from locally available materials that require minimal processing, saving money on the construction process. The Dam does not possess high artistic value or innovative engineering features. Therefore, the Santiago Dam is not eligible under NRHP Criterion C or CRHR Criterion 3.

NRHP Criterion D. That have yielded, or may be likely to yield, information important in prehistory or history.

CRHR Criterion 4. Has yielded, or may be likely to yield, information important in prehistory or history.

The subject property is not significant as a source, or likely source, of important historical

information nor does it appear likely to yield important information about historic construction methods, materials or technologies. Therefore, the subject property is not eligible under NRHP Criterion D or CRHR Criterion 4.

Integrity

Location: The subject property retains integrity of location as it remains in its current location.

Design: The subject property has integrity of design. Although there have been a few alterations, the design of the Dam remains relatively unchanged.

Setting: The subject property has integrity of setting. The Dam is still located in an undeveloped rural setting.

Materials: The subject property retains integrity of materials as the dam and spillway retain original materials.

Workmanship: The subject property retains integrity of workmanship as evidence of the original craftsmanship is present.

Feeling: The subject property retains integrity of feeling as the area remains undeveloped and rural.

Association: The subject property continues to be associated with the distribution of water for agricultural and domestic use.

The Santiago Dam is eligible for listing under NRHP and CRHR under Criterion A/1.

The Santiago Dam (P-30-176757) was constructed in 1933 and was initially recorded and evaluated for historical significance in 2003 by Cary D. Cotterman of Chambers Group, Inc. Cotterman recommended that that the Santiago Dam was eligible for listing on the NRHP under Criterion A at the local, state, and national level due to its "strong association with the history of water resources development in Orange County, as well as with the entire citrus agriculture industry" (Cotterman 2003). Further, Cotterman found that the dam retains good integrity of location, design, materials, workmanship, and association.

PaleoWest, LLC revisited the property on January 27, 2021. Based on field observations, PaleoWest found no evidence to indicate that the historic integrity of the Santiago Dam has been compromised subsequent to its initial recordation in 2003. Therefore, PaleoWest, LLC concurs with the 2003 recommendation that the Santiago Dam is eligible for listing on the NRHP under Criterion A at the local, state, and national level and retains sufficient integrity to convey that historical significance.

e. Other Locational Data (e.g., parcel #, directions to resource, elevation, etc., when appropriate: Santiago Dam is located at the north end of Irvine Lake (Santiago Reservoir) in the Santa Ana Mountains, approximately 7.0 miles east of downtown Orange. A paved road leads from Irvine Regional Park, through a locked gate, approximately 1.25 miles east, then southeast, to the dam.

*P3a. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries):
Santiago Dam is an earthen and concrete structure containing 1,100,000 cubic yards of clay, porous soil, and rock . The dam is 1,425 feet (0.27 mile) long at its crest, which rises 136 feet above the surrounding ground at its highest point. The reservoir created by the dam covers an area of 650 to 700 acres, depending on the surface level, and has a storage capacity of approximately 25,000 acre-feet of water. The south face of the dam, which holds back the reservoir, is filled with clay to prevent water penetration, and is faced with concrete slabs that are 6 inches thick and 6 feet square. The downstream portion of the dam is filled with earth, gravel, and rocks (Irvine Ranch Water District 2003; Compton et al. 2000; Serrano Irrigation District ca. 1959; University of California, Berkeley 2003). In plan view, the dam forms a gentle "S" curve, with a concrete spillway at its west end. A narrow gravel road runs along the crest of the dam from the east end to the spillway. Eight narrow concrete pylons support a 12-foot-wide concrete catwalk that extends over the spillway. Safety railings for the catwalk are provided by 4-foot-high concrete parapets.

B9b. Builder: On-site Engineer: Wess Albert
Contractor: R.G. Tourneau

*B10. Significance: Theme: 20th Century Water Resources Management/Citrus Industry Area: Orange County, California
Period of Significance: 1931-present Property Type: Dam Applicable Criteria: A
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

For most of the late 19th and early 20th centuries, the land around the present site of Santiago Dam was used for cattle and sheep grazing, as well as recreation. The Serrano Irrigation District (known today as the Serrano Water District) provided water for the earliest citrus groves in the Orange and Villa Park areas, beginning in 1876. By the late 1920s, the demand for irrigation water had increased to the point that a large storage reservoir was needed. In response to this demand, the Serrano Irrigation District and the John T. Carpenter Water Company of Villa Park undertook a joint project in 1930, selling bond issues worth $400,000 to finance half of the dam's construction. The Irvine Company, which owned the land, matched that amount, for a total of $800,000. By October of 1930, engineer A. Kempkey of San Francisco, assisted by Irvine Company engineer Roy Browning, was making exploratory drillings into the bedrock at the proposed dam site on Santiago Creek prior to drawing the construction blueprints. Santiago Dam was constructed, creating Santiago Reservoir (now called Irvine Lake), during 1931. Although the dam was designed by Kempkey, the on-site supervising engineer was Wess Albert, and the construction contractor was R.G. Tourneau. The dam was completed in December, 1931, and the reservoir was first completely filled, with water running over the spillway at its west end, in 1937. In 1934, a dam keeper's residence was constructed on a hillside overlooking the east end of the dam (Brigandi and Turnbull 2003; Genterra Consultants, Inc. 2003; Irvine Ranch Water District 2003; Orange City News 1930a, 1930b; Serrano Irrigation District n.d., 1959, 1967; Staub 2003). The water provided by the creation of the dam and reservoir contributed significantly to the early and mid 20th century development of the citrus industry in Orange County, one of the leading citrus-producing regions of the U.S. at that time. (See Continuation Sheet)

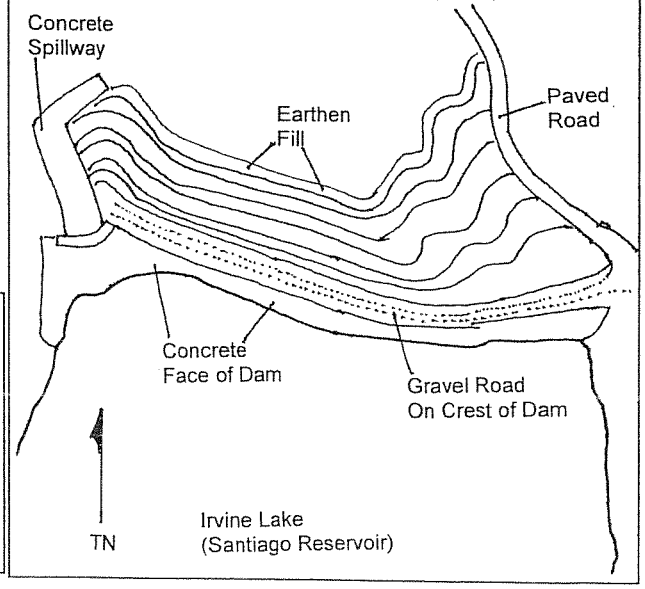
*Date of Evaluation: 5/28/2003

(This space reserved official comments.)

(Sketch Map with north arrow required.)



B10. Significance (continued from Building, Structure, and Object Record):

The facility was originally intended only for irrigation water storage, but was opened for recreational use in 1941. Today, the Irvine Ranch Water District still distributes untreated water from the reservoir for irrigation, while the Serrano Water District supplies treated drinking water to Villa Park and portions of Orange, and operates Irvine Lake's recreational concessions (Irvine Ranch Water District 2003; Compton et al. 2000; University of California, Berkeley 2003).

The water provided by the creation of Santiago Dam and Reservoir contributed significantly to the early and mid 20th century development of the citrus industry in Orange County, which was a leading supplier of oranges, lemons, and grapefruit to the entire nation at that time. Therefore, given its strong association with the history of water resources development in Orange County, as well as with the citrus agriculture industry on not only a regional but on a state and national level, the dam is recommended eligible for listing on the NRHP under Criterion A. Because the dam has undergone little modifications since its construction, it retains good integrity of location, design, materials, workmanship, and association.

***P3a. Description (Continued):**

The Taiwan 12kV line runs as far north as the Windy Ridge Toll Plaza on State Road 241 (Eastern Transportation Toll Road); as far east as the intersection of Blackstar Canyon Road and State Spur Road; as far south as intersection of Black Star Canyon Road, Silverado Canyon Road, and Santiago Canyon Road; and as far west as East Chapman Avenue, just west of South Rancho Santiago Road. The line is mostly concentrated in a housing development bounded by East Chapman Avenue and Canyon View Avenue to the west, east Chapman Avenue to the north, Jamboree Road to the east, and Canyon View Avenue to the south.

The Taiwan line interests the project boundary at the northern and southern borders. To the north, the line runs east to west from the spillway to the Dam Keeper's Residence and is located just north of the spillway. To the south, the line intersects the project boundary at three different points running north to south.

Exhibit 1: Taiwan 12kV Overhead Distribution Line, view north (Psomas 2023)

***B10. Significance (Continued):**

Historic Context

SCE's Historic-Era Electrical Infrastructure Management Program (HEIMP) requires examination of electrical infrastructure in consideration of three major themes: 1) association with SCE's organizational history; 2) association with SCE's construction and implementation campaigns or the established period of significance for 66kV, 220kV, and 500kV systems; and 3) association and embodiment of SCE's architectural programming and aesthetic ideology at SCE Substations (Tinsley Becker et al 2017). The following historic context examines relevant portions of these major themes in consideration of the types of SCE resources identified within the APE (see Section 6, Identified Resources), referencing information from the HEIMP and other relevant sources throughout.

Organizational History

The West Side Lighting Company was formed by a syndicate of businessmen from Los Angeles in 1896. One year later, the company merged with General Electric to become the new Edison Electric Company of Los Angeles. Soon after, the newly formed Edison Electric Company began to look for additional power supplies in Downtown Los Angeles and purchased the Southern California Power Company in 1898. Over the next few years, Edison merged with other electric lighting and power companies, expanding its footprint beyond Los Angeles to areas as far as Santa Barbara and Redlands. By 1909, the Edison Electrical Company provided service to over 600,000 customers across five counties. "To reflect this expanded presence, the company was reincorporated as the Southern California Edison Company (SCE)." (Williams et al 2016).

In the early part of the twentieth century, SCE continued to expand its service territory throughout Southern California, beginning construction of the Long Beach Steam Plant in 1910 and new 66kV steel tower transmission lines to upgrade the old 33kV network of wood poles. After successfully merging with Henry Huntington's Pacific Light and Power Company (PLPC) in 1916, SCE added 69 additional communities to its service territory. SCE then focused its efforts on expanding the existing 150kV Big Creek Hydroelectric System, upgrading it to 220kV in 1923. In the 1920s SCE undertook a massive building campaign which included "dams and reservoirs, building of powerhouses, rail lines, and tunnels, as well as support camps replete with food and housing for workers, recreation and entertainment offerings, medical facilities, and administrative offices." (Williams et al 2016)

In 1930, SCE contracted with the U.S. Department of the Interior to generate power for construction of the Hoover Dam. Similar contracts were established between the U.S. federal government and the City of Los Angeles and Southern Sierras Power Company (SSP) in order to pay for project costs over a 50-year period. Initially constructed for the purpose of powering construction of the Hoover Dam, the SSP Boulder Dam to San Bernardino Transmission line went into service in 1931. Upon completion of the dam, the line carried electricity to San Bernardino. This line was acquired by SCE as part of the 1964 Calectric merger (Tinsley Becker et al 2017).

Calectric and SCE had overlapping service territories from approximately 1917 until 1964 throughout the Los Angeles Basin and Inland Empire. In order to improve costs, Calectric was acquired by SCE in 1964. This was last major merger/change in the company's organizational history (Tinsley Becker et al 2017).

Transmission Lines

In the first part of the twentieth century, SCE was continuing to expand in response to a growing Southern California region. "By 1904 the common voltage capacity of transmission lines was reported to be 66,000 volts (66kV), which was considered the minimum voltage necessary for lighting plants in major United States cities." (Tinsley 2017). The earliest identified steel lattice towers within the existing SCE System were installed for the Kern River-Los Angeles Transmission Line in 1907. Shortly thereafter, SCE implemented additional all-steel lattice tower lines throughout its 66kV system. In 1910, SCE began construction of its Long Beach Steam Plant and implemented a new 66kV transmission line system to replace the old 33kV wooden pole lines that had been installed at the end of the 19th century. By 1912, double-circuit 66kV towers were widely used, coinciding with the completion of the Long Beach Steam Plant between 1910 and 1914 (Tinsley Becker et al 2017).

The SCE Big Creek Hydroelectric System East-West Transmission Line was put into service in 1912-

1913 to carry 150kV from the Big Creek Hydroelectric System in the Sierra National Forest northeast of Fresno to the Eagle Rock Substation in Los Angeles. The purpose of the 241-mile transmission line was to convey electricity from the powerhouses at Big Creek to Los Angeles for distribution to SCE service territories (Tinsley Becker et al 2012). The East and West lines were upgraded in 1922-1923 to carry 220kV, doubling the capacity of the lines (Pomona Progress 1922). In May 1923, the last span of the 241-mile 220kV transmission line was tied in, touted as being "the world's greatest achievement in long distance, high voltage transmission." (The Bulletin 1923). SCE continued to develop the Big Creek Hydroelectric System into the 1920s with the construction of dams, reservoirs, powerhouses, rail lines, and tunnels. Additionally, updates were made to the existing East and West Transmission Lines, with new lines installed to convey electricity between Big Creek and Los Angeles.

"By 1930 the backbone of SCE's 66kv and 220kV system was fully developed and included the use of 220kV double-circuit towers and 66kV multi-circuit towers ranging from 4 to 14 circuits." (Tinsley Becker et al 2017). SCE continued to develop new tower types for its 220kV system into the 1930s, creating larger single- and double-circuit towers inspired by old designs. These designs became standard, 'off the shelf' tower types by the 1940s.

The identified period of significance for 66kV and below transmission lines is 1907-1930, which includes the construction of the Kern River-Los Angeles Transmission Line in 1907 through completion of the 66kV system by 1930 (Tinsley Becker et al 2017).

Wooden Distribution Lines

The use of wood pole support structures for electrical transmission or distribution lines represents borrowed technology from the telegraph transmission system, and the technology itself has changed little over time. Wood poles carry the electrical wires (with voltages 33kV and below) on cross arms or via a connection to their insulators. Given this lack of change in technology and appearance over time, it is difficult for a wooden distribution line to convey a particular period of significance in electrical infrastructure history, and by extension, to any significant themes and associations (Tinsley Becker et al. 2017, Williams 2023).

> The "typical" life of a wood pole transmission or distribution line structure is 50 years, although some last longer and others deteriorate much sooner. Wood pole supported transmission or distribution lines over 50 years of age usually lack original integrity of materials despite substantially retaining the look and feel of the original wood-pole transmission or distribution line. Replacement wood-poles or hardware parts, therefore, can continue the utilitarian historic fabric representative of the original potentially historic transmission or distribution line structures because of the lack of any distinct engineering or architectural attributes. The common and indistinctive nature of wood-pole transmission or distribution line structures disqualify them as potentially National Register eligible. They are purely functional and utilitarian in use and common in appearance (Tinsley Becker et al. 2017:64).

Significance Evaluation

The Taiwan 12kV Overhead Distribution Line is not eligible for the NRHP, CRHR, and local landmark designation based on the following application of designation criteria and integrity requirements.

NRHP Criterion A. That are associated with events that have made a significant contribution to the broad patterns of our history.

CRHR Criterion 1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

Guidance provided in Tinsley Becker et al. 2015 states that subtransmission lines and their associated infrastructure should be evaluated under two important themes, which are most appropriately examined below under Criteria A/1/2:

(1) An association with and representation of SCE's organizational history as evidence of key expansion periods that contributed to or served as the genesis of settlement or marked growth in community services by SCE.

The Taiwan 12kV Overhead Distribution line was energized c. 1952. Information regarding the construction of the line is limited. The design for distribution lines was borrowed from telegraph transmission technology and uses infrastructure that is found state-wide. The principles of the design of distribution systems is rudimentary with minor changes since its inception and is unable to reflect significance from the period from which they were constructed

(2) An association with SCE's original construction and implementation campaigns or the established period of significance for the company's 66kV, 220kV, and 500kV systems.

The Taiwan 12kV Overhead Distribution line is not associated with SCE's early construction and implementation campaigns, nor does it fall within the period of significance for either SCE's 66kV, 220kV, or 500kV systems.

For the reasons demonstrated above, the subject property is not eligible under NRHP Criterion A or CRHR Criterion 1,

NRHP Criterion B. That are associated with the lives of persons significant in our past.

CRHR Criterion 2. Is associated with the lives of persons important in our past.

The subject property is a transmission line that is not associated with any specific owners. Its only owners have been SCE. Review of local publications and newspaper articles failed to indicate that the subject property has any important associations with significant persons in regional or SCE history. Therefore, the subject property is not eligible under NRHP Criterion B, CRHR Criterion 2, or County Criterion 3.

NRHP Criterion C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction.

CRHR Criterion 3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

The Taiwan 12kV Overhead Distribution Line does not serve as an important example of electrical infrastructure on SCE's system. Under this criterion, wood poles are considered ubiquitous and indistinctive utilitarian structures that are purely functional and do not exhibit any important construction methods or technologies. Further, the line is not an early example of electrical voltage or transmission technology and does not represent an innovation in engineering design or for construction material technology. Therefore, the subject line is not eligible under NRHP Criterion C or CRHR Criterion 3.

NRHP Criterion D. That have yielded, or may be likely to yield, information important in prehistory or history.

CRHR Criterion 4. Has yielded, or may be likely to yield, information important in prehistory or history.

The subject property is not significant as a source, or likely source, of important historical information nor does it appear likely to yield important information about historic construction methods, materials, or technologies. Therefore, the property is not eligible under NRHP Criterion D or CRHR Criterion 4.

Integrity

Location: The subject property retains integrity of location as it remains in its current location.

Design: The subject property has integrity of design. Although there have been a few alterations, the design of the dam and spillway remain unchanged.

Setting: The subject property has integrity of setting. The line continues to be located in an undeveloped rural setting.

Materials: The subject property appears to retain integrity of materials as they do not appear to have been replaced.

Workmanship: The subject property retains integrity of workmanship as evidence of the original craftsmanship is present.

Feeling: The subject property retains integrity of feeling as the presence of wood poles help it retain a circa 1952 feeling.

Association: The subject property has no important associations with any patterns of regional development or SCE organization history and falls outside the period of significance for 66kV electrical transmission.

The Taiwan 12kV Overhead Distribution line is not eligible for listing under NRHP and CRHR under any designation criteria.

Laura G. Carías, MA

SENIOR ARCHITECTURAL HISTORIAN

Laura Carías has over 17 years' experience in the field of historic and cultural resources evaluation, identification, documentation, and preservation. Ms. Carías specializes in historic resources assessments including historic significance evaluation in consideration of the California Register of Historical Resources (CRHR), and the National Register of Historic Places (NRHP), and local-level evaluation criteria. She also has experience in intensive-level field surveys, historic structure reports, design consultation, conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties, Historic American Buildings Survey (HABS) and Historic American Engineering Record (HAER) documentation, local Mills Act contracts, and local, state, and national landmark designations.

Ms. Carías meets the Secretary of the Interior's Professional Qualification Standards for both Architectural History and History. She has experience preparing environmental compliance documentation in support of projects that fall under the California Environmental Quality Act (CEQA/National Environmental Quality Act (NEPA), and Section 106 of the National Historic Preservation Act (NHPA).

EXPERTISE

- CEQA, NEPA, and Section 106 of the NHPA compliance documentation in consideration of impacts to historical resources, and historic properties
- Historic resource significance evaluations in consideration of NRHP, CRHR, and local designation criteria
- Project design review for conformance with the Secretary of the Interior's Standards
- Preparation of archival documentation for HABS/HAER/HALS
- Historic Structure Reports
- Historic Preservation Certification Part 1 and 2 Tax Credit Applications

RECENT PROJECT EXPERIENCE

Historic-Era Built Environmental Survey Report for SCE Sespe Creek Pole Replacement Project and Overhead Modification Project, Ventura County (2023). South Environmental was retained to complete a Historic-Era Built Environment Survey Report for the Southern California Edison (SCE) Sespe Creek Pole Replacement Project (proposed project) located in Ventura County, California. The report included the results of an intensive-level pedestrian survey of all built environmental resources over 50 years old within the project's Area of Potential Effect (APE) by a qualified architectural historian; building development and archival research; and recordation and evaluation of the idle Saugus-Fillmore-Santa Clara-Wakefield 66kV subtransmission line, a Quonset hut, and a single-family residence for historical significance in consideration of federal, state, and local designation criteria and integrity requirements. The report was prepared in conformance with Section 106 of the National Historic Preservation Act (NHPA) and its implementing regulation Title 36 Code of Federal Regulations (CFR) Part 800, the California Environmental Quality Act (CEQA) Section 15064.5 for historical resources, and in consideration of all applicable local guidelines and regulations concerning cultural resources. In conclusion, no historic properties/historical resources were identified within the project APE. Therefore, with respect to historic built environment resources, the proposed project would have no adverse effect on historic properties under Section 106 of the NHPA and a less than significant impact on historical resources under CEQA. Ms. Carías performed the site visit and served as co-author of the report.

Historic Property Survey and Recordation for 1306 Alameda Padre Serra, City of Santa Barbara, California (2022). South Environmental was retained by a private property owner to survey and research a 1920 residential property within the City of Santa Barbara. This project included an intensive-level, pedestrian survey of the project site by a qualified architectural historian, building development and archival research; coordination with the City; and recordation of one residential property. As a result of this property significance evaluation, the property was found not eligible for designation at the local level.

Historic Built Environment Assessment for Fairfield Justice Campus Asset Protection and Resiliency Project (2022) South Environmental was retained to prepare an historic built environment assessment report in support of the Fairfield Justice Campus Asset Protection and Resiliency Project (project) located in the City of Fairfield, Solano County, California. The purpose of this report is to determine if the proposed project will result in impacts to historic built environment resources located within or adjacent to the project site. This report was prepared in conformance with the requirements of the CEQA Guidelines § 15064.5 for historical resources, and the City of Fairfield Chapter 25, Article XIII, Historic Preservation Ordinance. No historical resources were identified within the project site as a result of this study. Therefore, with respect to built environment resources, the proposed project will have a less than significant impact on historical resources under CEQA.Ms. Carías served as senior architectural historian and author for the report.

Historical Resource Assessment Report for the Civic Center Master Plan Project, Moorpark, California (2022) South Environmental was retained to complete a Historical Resource Assessment Report for the Civic Center Master Plan Project located in the City of Moorpark in Ventura County, California. This study includes the results of a literature review, pedestrian survey of the project site by a qualified architectural historian; building development and archival research; and an assessment of potential impacts to historic built environment resources under CEQA. One historical resource was identified directly adjacent to the project site as a result of the background research and pedestrian survey: the CRHR-listed Tanner Corner building located at 601 Moorpark Avenue. Although the project does not propose any changes or direct impacts to this resource that would impair its major character-defining features, the building's proximity to proposed demolition and construction activities is considered a potentially significant impact. Ms. Carías served as architectural historian and author of the report.

Samantha Murray, MA

CULTURAL RESOURCES DIRECTOR

Samantha Murray is the cultural resources director at South Environmental and a principal architectural historian and archaeologist with over 17 years' experience in all elements of cultural resources management, including project management, archaeology and architectural history studies, and historical significance evaluations in consideration of the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and local-level designation criteria. Ms. Murray has conducted thousands of historical resource evaluations and developed detailed historic context statements for a multitude of property types and architectural styles. She has also provided expertise on numerous projects requiring conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties.

Ms. Murray meets the Secretary of the Interior's Professional Qualification Standards for both Archaeology and History. She is experienced managing multidisciplinary projects in the lines of private development, transportation, transmission and generation, federal land management, land development, and state and local government. She is an expert in preparation of cultural resources compliance documentation for projects that fall under the California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), and Sections 106 and 110 of the National Historic Preservation Act (NHPA). Ms. Murray has also served as an expert witness in legal proceedings concerning historical resources under CEQA and local ordinance protection.

EXPERTISE

- CEQA, NEPA, and Section 106 of the NHPA compliance documentation in consideration of impacts to historical, archaeological, and tribal cultural resources, and historic properties.
- Resource significance evaluations in consideration of NRHP, CRHR, and local designation criteria.
- Project design review for conformance with the Secretary of the Interior's Standards.
- Assistance with complex mitigation including HABS/HAER/HALS, salvage, and interpretive displays.
- Peer review.

RELEVANT PROJECT EXPERIENCE

Historical Resources Evaluation Report for the I-5 Improvement Project (San Diego County Line to Avenida Pico), City of San Clemente, Orange County, California (2022). South Environmental was retained to prepare a Historical Resource Evaluation Report in support of the I-5 Improvement Project in the City of San Clemente. South Environmental carried out a survey of the I-5 corridor from the San Diego County line to Avenida Pico in the City of San Clemente and identified six built environment resources over 45 years old. The resources were evaluated for historical significance in consideration of NRHP, CRHR and City designation criteria and integrity requirements and were found not eligible under all designation criteria and integrity requirements. The proposed project was found to have a less than significant impact on historical resources under CEQA. Ms. Murray served as the contract manager for this project and conducted quality assurance/quality control (QA/QC) of the final document.

Southern California Edison (SCE) Subconsultant Agreement for Capital Projects (2021-ongoing). South Environmental is a subconsultant on SCE's Environmental Clearance and Capital Projects contract and provides cultural resources services throughout SCE's service territory in Southern California. Ms. Murray functions as an Architectural History and Archaeological Principal Investigator and oversees both historic built environment and archaeological components of large-scale utility projects subcontracted to South Environmental, including NRHP/CRHR significance evaluations for a variety of electrical substations and transmission lines and large-scale archaeological field work and testing requiring multiple field technicians. Technical reports recently completed by South Environmental include the following:

- Historic-Era Built Environment Survey Report for the Del Valle Substation Project in Los Angeles and Ventura Counties
- Historic-Era Built Environment Survey Report for the Cal City 115 kv Upgrade Project in Los Angeles and Kern Counties

City of San Diego Source Water System Historic Context Statement, City of San Diego, California (2020). While working for her previous firm, Ms. Murray served as principal architectural historian, managed the task order, co-authored the report, and conducted QA/QC on the final document. The City of San Diego requested preparation of a detailed historic context statement built on extensive archival research on the City of San Diego Public Utilities Department's source water system, with particular focus on 11 major pieces of water infrastructure: Morena, Lower Otay, Upper Otay, Murray, Lake Hodges, Barrett, El Capitan, San Vicente, Sutherland, and Miramar Reservoir Complexes, and the Dulzura Conduit. These elements were subject to intensive-level survey and focused research by qualified architectural historians to facilitate preparation of a historical significance evaluation of the City of San Diego Source Water System and its contributing resources, as well as consideration of each resource's individual significance. The research and analysis conducted as part of this study will provide the City and its consultants with the foundation for assessing the historical significance of infrastructure identified throughout the City of San Diego Source Water System as part of future CEQA and NEPA projects. The project also included development of a pamphlet highlighting the history of the City's water system and a timeline of milestone events.

Los Angeles Department of Water and Power (LADWP) As-Needed Environmental Compliance Services (2016-2021). While working for her previous firm, Ms. Murray served as the cultural resources principal investigator, co-authored all technical reports, and provided quality assurance/quality control of numerous technical documents for a variety of projects. Ms. Murray prepared both CEQA and CEQA Plus cultural resources documentation for a wide range of water and electrical infrastructure projects throughout LADWP's service territory. When LADWP project funding sources included the State Water Resources Control Board's (SWRCB) Drinking Water State Revolving Fund, applications for funding must include proof of CEQA compliance and of compliance with federal requirements. CEQA Plus documentation typically includes development of an area of potential effects, completion of a CHRIS records search, Native American coordination, intensive pedestrian survey, identification of historical resources/historic properties, and an assessment of project-related impacts/effects to both archaeological and historic built environment resources.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

SILVERADO
ANAHEIM, CA 92808

COORDINATES

Latitude (North):	33.7861000 - 33° 47' 9.96''
Longitude (West):	117.7253000 - 117° 43' 31.08''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	432850.5
UTM Y (Meters):	3738482.2
Elevation:	795 ft. above sea level

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL ---------- National Priority List
Proposed NPL ---------- Proposed National Priority List Sites
NPL LIENS ---------- Federal Superfund Liens

Federal Delisted NPL site list

Delisted NPL ---------- National Priority List Deletions

Federal CERCLIS list

FEDERAL FACILITY ---------- Federal Facility Site Information listing
SEMS ---------- Superfund Enterprise Management System

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE ---------- Superfund Enterprise Management System Archive

Federal RCRA CORRACTS facilities list

CORRACTS ---------- Corrective Action Report

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF ---------- RCRA - Treatment, Storage and Disposal

Federal RCRA generators list

RCRA-LQG ---------- RCRA - Large Quantity Generators
RCRA-SQG ---------- RCRA - Small Quantity Generators
RCRA-VSQG ---------- RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

Federal institutional controls / engineering controls registries

LUCIS ---------- Land Use Control Information System

US ENG CONTROLS..... Engineering Controls Sites List
US INST CONTROLS..... Institutional Controls Sites List

Federal ERNS list

ERNS..... Emergency Response Notification System

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 07/29/2020
Date Data Arrived at EDR: 08/03/2020
Date Made Active in Reports: 08/25/2020
Number of Days to Update: 22

Next Scheduled EDR Contact: 10/12/2020
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/29/2020

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 04/03/2019
Date Data Arrived at EDR: 04/05/2019

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/23/2020
Date Data Arrived at EDR: 03/25/2020
Date Made Active in Reports: 05/21/2020
Number of Days to Update: 57

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners
EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 05/12/2020

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

SANTIAGO CREEK DAM IMPROVEMENT
SILVERADO
ANAHEIM, CA 92808

TARGET PROPERTY COORDINATES

Latitude (North):	33.7861 - 33° 47' 9.96''
Longitude (West):	117.7253 - 117° 43' 31.08''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	432850.5
UTM Y (Meters):	3738482.2
Elevation:	795 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5636465 BLACK STAR CANYON, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

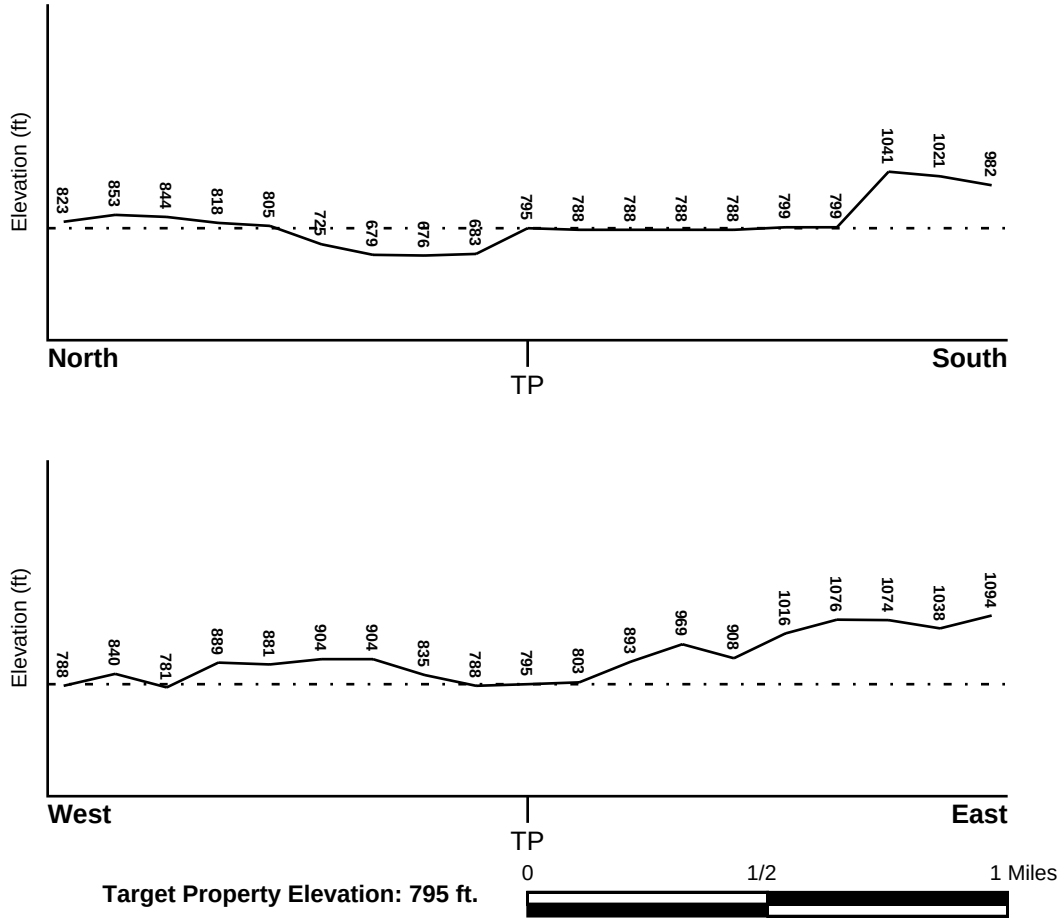
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Target Property Elevation: 795 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06059C0190J	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
Not Reported	

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NOT AVAILABLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Water

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: Dam

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 3

Soil Component Name: SORRENTO

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 8.4 Min: 7.9
2	11 inches	61 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 8.4 Min: 7.9
3	61 inches	72 inches	stratified loamy fine sand to silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 8.4 Min: 7.9

Soil Map ID: 4

Soil Component Name: PITS

Soil Surface Texture: extremely gravelly coarse sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Subject: Updated Noise and Vibration Analysis Technical Memorandum for the Santiago Creek Dam Outlet Tower and Spillway Improvements Project

Dear Mr. Uk:

This Letter Report presents the results of the revised noise and vibration analysis for the proposed Santiago Creek Dam Outlet Tower and Spillway Improvements Project in the County of Orange, California (hereinafter referred to as the "Project"). This analysis addresses the potential noise and vibration impacts associated with the Project in accordance with the California Environmental Quality Act (CEQA) (*California Public Resources Code* §21000 et seq.) and the State CEQA Guidelines (*California Code of Regulations*, Title 14, §15000 et seq.). This updated noise and vibration analysis was prepared in order to include noise generated during a new construction phase in the overall Project construction noise calculations. This new phase would entail the placement of the embankment. This phase would take up to 16 months to complete and would be integrated into the overall Project construction schedule.

PROJECT SETTING AND DESCRIPTION

The proposed Project would include rehabilitation and replacement of the Santiago Creek Dam outlet works and spillway facilities, necessary to address identified seismic and dam safety concerns. The Project involves dewatering, demolition activities, and construction of inlet/outlet works, downstream outlet works, pipelines, ancillary site improvements, and utility relocation. The Project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in Unincorporated Orange County, California. The Project site location is shown on Exhibit 1-1 and 1-2, Regional Location and Local Vicinity, and is described in more detail below.

Noise and Vibration Basics and Terminology

Noise

"Sound" is a vibratory disturbance created by a moving or vibrating source and is capable of being detected. "Noise" is defined as sound that is loud, unpleasant, unexpected, or undesired and may therefore be classified as a more specific group of sounds. The effects of noise on people can include general annoyance; interference with speech communication; sleep disturbance; and, in the extreme, hearing impairment (Caltrans 2013).

Suite 102
Pasadena, CA 91105

Tel 714.481.8057
www.Psomas.com

Sound pressure levels are described in units called the decibel (dB). Decibels are measured on a logarithmic scale. A doubling of the energy of a noise source (such as doubling of traffic volume) would increase the noise level by 3 dB. The human ear is not equally sensitive to all frequencies within the sound spectrum. To accommodate this phenomenon, the A-scale was devised. The A-weighted decibel scale (dBA) approximates the frequency response of the average healthy ear when listening to most ordinary everyday sounds and is used in this analysis.

Human perception of noise has no simple correlation with acoustical energy. Due to subjective thresholds of tolerance, the annoyance of a given noise source is perceived very differently from person to person. The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at 3 feet is approximately 60 dBA, while loud jet engine noises at 1,000 feet equate to 100 dBA, which can cause serious discomfort. Table 1 shows the relationship of various noise levels in dBA to commonly experienced noise events.

TABLE 1
NOISE LEVELS FOR COMMON EVENTS

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	110	Rock Band
Jet fly-over at 300 m (1,000 ft)	100	
Gas lawn mower at 1 m (3 ft)	90	
Diesel truck at 15 m (50 ft) at 80 km/hr (50 mph)	80	Food blender at 1 m (3 ft); garbage disposal at 1 m (3 ft)
Noisy urban area, daytime gas lawn mower at 30 m (100 ft)	70	Vacuum cleaner at 3 m (10 ft)
Commercial area, heavy traffic at 90 m (300 ft)	60	Normal speech at 1 m (3 ft)
Quiet urban daytime	50	Large business office, dishwasher in next room
Quiet urban nighttime	40	Theater, large conference room (background)
Quiet suburban nighttime	30	Library
Quiet rural nighttime	20	Bedroom at night, concert hall (background)
	10	Broadcast/recording studio
Lowest threshold of human hearing	0	Lowest threshold of human hearing
dBA: A-weighted decibels; m: meter; ft: feet; km/hr: kilometers per hour; mph: miles per hour Source: Caltrans 2013.		

Two equal noise sources, when heard together, do not “sound twice as loud” as one of the sources. As stated above, a doubling of noise sources results in a noise level increase of 3 dBA. It is widely accepted that (1) the average healthy ear can barely perceive changes of a 3 dBA increase or decrease, (2) a change of 5 dBA is readily perceptible, and (3) an increase (decrease) of 10 dBA sounds twice (half) as loud (Caltrans 2013).

From the source to the receiver, noise changes both in the level and frequency spectrum. The most obvious change is the decrease in noise level as the distance from the source increases. Sound from a small, localized source (approximating a “point” source) radiates uniformly outward as it travels away from the source in a spherical pattern. For point sources, such as heating, ventilation, and air conditioning (HVAC) units or construction equipment, the sound level attenuates (or drops off) at a rate of 6 dBA for each doubling of distance (i.e., if the noise level is 70 dBA at 25 feet, it is 64 dBA at 50 feet). Vehicle movement on a road makes the source of the sound appear to emanate from a line (line source) rather than

a point when viewed over some time interval. The sound level attenuates or drops off at a rate of 3 dBA per doubling of distance for line sources.

A large object in the path between a noise source and a receiver can significantly attenuate noise levels at that receiver location. The amount of attenuation provided by this "shielding" depends on the size of the object and the frequencies of the noise levels. Natural terrain or landform features as well as man-made features (e.g., buildings and walls) can significantly alter noise exposure levels. For a noise barrier to work, it must be high enough and long enough to block the view from the receiver to a road or to the noise source. Effective noise barriers can reduce outdoor noise levels at the receptor by up to 15 dBA.

Several rating scales (or noise "metrics") exist to analyze effects of noise on a community. These scales include the equivalent noise level (L_{eq}), including L_{max} and L_{min}, which are respectively the highest and lowest A-weighted sound levels that occur during a noise event, and the Community Noise Equivalent Level (CNEL). Average noise levels over a period of minutes or hours are usually expressed as dBA L_{eq}, which is the equivalent noise level for that period of time. The period of time averaging may be specified; for example, $L_{eq(3)}$ would be a three-hour average. Noise of short duration (i.e., substantially less than the averaging period) is averaged into ambient noise during the period of interest. Thus, a loud noise lasting many seconds may have minimal effect on the measured sound level averaged over a one-hour period.

To evaluate community noise impacts, CNEL was developed to account for human sensitivity to nighttime noise. CNEL represents the 24-hour average sound level with a penalty for noise occurring at night. The CNEL computation divides a 24-hour day into three periods: daytime (7:00 AM to 7:00 PM), evening (7:00 PM to 10:00 PM), and nighttime (10:00 PM to 7:00 AM). The evening sound levels are assigned an approximately 5-dBA penalty, and the nighttime sound levels are assigned a 10-dBA penalty prior to averaging with daytime hourly sound levels.

Vibration

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Vibration is normally associated with activities such as railroads or vibration-intensive stationary sources, but can also be associated with construction equipment such as jackhammers, pile drivers, and hydraulic hammers. Vibration displacement is the distance that a point on a surface moves away from its original static position. The instantaneous speed that a point on a surface moves is described as the velocity, and the rate of change of the speed is described as the acceleration. Each of these descriptors can be used to correlate vibration to human response, building damage, and acceptable equipment vibration levels. During construction of a project, the operation of construction equipment can cause groundborne vibration. During the operational phase of a project, receptors may be subject to levels of vibration that can cause annoyance due to noise generated from vibration of a structure or items within a structure. Analysis of this type of vibration is best measured in velocity and acceleration.

The three main wave types of concern in the propagation of groundborne vibrations are surface or Rayleigh waves, compression or P-waves, and shear or S-waves.

- Surface or Rayleigh waves travel along the ground surface. They carry most of their energy along an expanding cylindrical wave front, similar to the ripples produced by throwing a rock into a lake. The particle motion is more or less perpendicular to the direction of propagation (known as retrograde elliptical).

- Compression or P-waves are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal, in a push-pull motion. P-waves are analogous to airborne sound waves.
- Shear or S-waves are also body waves, carrying their energy along an expanding spherical wave front. Unlike P-waves, however, the particle motion is transverse, or perpendicular to the direction of propagation.

The peak particle velocity (PPV) or the root mean square (rms) velocity is usually used to describe vibration amplitudes. The PPV is defined as the maximum instantaneous peak of the vibration signal and the rms is defined as the square root of the average of the squared amplitude of the signal. The ppv is more appropriate for evaluating potential building damage and also used fora evaluating human response.

The units for PPV velocity are normally inches per second (in/sec). Often, vibration is presented and discussed in VdB units in order to compress the range of numbers required to describe the vibration. In this study, all PPV velocity levels are in in/sec and all vibration levels are in VdB relative to one microinch per second. The threshold of perception is approximately 0.3 in/sec PPV. Typically, groundborne vibration generated by human activities attenuates rapidly with distance from the source of the vibration. Even the more persistent Rayleigh waves decrease relatively quickly as they move away from the source of the vibration. Manmade vibration problems are, therefore, usually confined to short distances (500 feet or less) from the source.

Construction generally includes a wide range of activities that can generate groundborne vibration. In general, blasting and demolition of structures generate the highest vibrations. Heavy trucks can also generate groundborne vibrations, which vary depending on vehicle type, weight, and pavement conditions. Potholes, pavement joints, discontinuities, differential settlement of pavement, and other anomalies all increase the vibration levels from vehicles passing over a road surface. Construction vibration is normally of greater concern than vibration of normal traffic on streets and freeways with smooth pavement conditions.

EXISTING CONDITIONS

Due to the undeveloped nature of the area proximate to the Project site, the existing noise environment at the Project Site is primarily influenced by traffic noise on nearby roads as well as activities held at the site and events that are regularly held at Oak Canyon Park that occur both during the day and through the evening. The nearest roadways that affect ambient noise levels at the Project site are the Eastern Transportation Corridor Toll Road (State Route 241), State Route 261 (SR-261), and Santiago Canyon Road. At its closest point, the nearest road (SR-241) is more than half a mile from Irvine Lake. As such, ambient noise levels are low and characteristic of rural areas.

Orange County Fire Authority (OCFA) currently uses portions of the proposed staging area for takeoff and landings associated with training and operational activities. During construction of the proposed Project, HeloPods would be designated near the lake for their continued use. In addition, Oak Canyon Park hosts a number of events, including graduation nights, picnics, concerts, athletic events, shows, and other events that may include crowds, music and amplified sound. Based on the 2023 Oak Canyon Park Calendar for 2023, there are approximately 80 scheduled events whose turnout ranges from 150-5,000 attendees. Noise from these existing activities contribute to substantially increasing the ambient noise levels within the area due to amplified speakers for music and announcements, cheering crowds, helicopter noise, music concerts, traffic noise, automobile shows, and other sources. Many of these events last 10 hours a day, and up to 17 days per month with overnight activities.

Noise-Sensitive Receptors

The State of California defines noise-sensitive receptors as those land uses that require serenity or are otherwise adversely affected by noise events or conditions (State of California 2015). Noise-sensitive land uses typically include residences, hospitals, churches, schools, and libraries, which could all be adversely affected by an increase in noise levels. Noise sensitive receptors in the vicinity of each proposed Project Site include residential land uses located approximately 9,500 feet to the west. There are nearby parks which include Oak Canyon Park, Irvine Regional Park, and Irvine Lake.

Regulatory Setting – Noise Criteria

Public agencies have established noise guidelines and standards to protect citizens from potential hearing damage and various other adverse physiological and social effects associated with noise. The Project is located within the County of Orange. For the evaluation of potential noise impacts, this analysis assumes compliance with the noise policies and regulations established by the County of Orange and the Federal Transit Administration.

Federal Transit Administration

The Federal Transit Administration's (FTA) Transit Noise and Vibration Impact Assessment Manual (FTA 2018) has developed construction impact guidelines shown in Table 2.

TABLE 2
CONSTRUCTION NOISE CRITERIA

1-Hour Criteria (L_{eq})		
Land Use	**Day**	**Night**
Residential	90	80
Commercial	100	100
Industrial	100	100
8-Hour Criteria (L_{eq})		
Land Use	**Day**	**Night**
Residential	80	70
Commercial	85	85
Industrial	90	90

There are no construction noise criteria for parks. Residential uses are considered to be the most noise sensitive land use.

County of Orange

According to Section 7-9-20(h) of the Orange County Zoning Code, land owned or leased by the County is not subject to land use regulations of the County, including the Zoning Code, specific plans, and planned communities. However, the County noise standards are applicable to offsite noise-sensitive land uses that would potentially be impacted by noise from the Project construction and operations. For information disclosure purposes pursuant to CEQA, the County's standards, including the policies of the General Plan and the Noise Ordinance, are discussed below.

General Plan

The Noise Element, one of nine elements of the *County of Orange General Plan*, contains official County policies on the conservation and management of resources (County of Orange 2015). The Noise Element defines a Noise Referral Zone as "that area with a total noise environment of 60 decibels Community Noise Equivalent Level (CNEL) or more. The intent of the Noise Referral Zone is to act as a triggering mechanism or flag for development proposals in areas potentially adversely affected by high noise levels. [U]nless it can be shown with certainty that the project is outside the area that has a CNEL of 60 or more decibels, an acoustical analysis report will be required".

The Noise Element states, "A key objective of this Noise Element is to ensure that each County resident's quality of life is not affected adversely by high noise levels". The information from Tables VIII-2 and VIII-3 of the Noise Element, shown as Table 3 in this Section, defines the County's land use/noise compatibility standards. The Noise Element states that these standards apply to "situations where a new use is being proposed that is impacted by an existing noise source" and also "when an existing use is impacted by a new or expanded source of noise". For the latter case, "the project proponent is obliged to mitigate the impacts of the new source of noise".

TABLE 3
ORANGE COUNTY COMPATIBILITY MATRIX FOR LAND USE AND COMMUNITY NOISE EQUIVALENT LEVELS

Type of Use	65+ dB CNEL	60 to 65 dB CNEL
Residential	3a, b, e	2a, e

dB: decibel; CNEL: Community Noise Equivalent Level

EXPLANATION AND DEFINITIONS

Action Required to Ensure Compatibility Between Land Use and Noise From External Sources

1 = Allowed if interior and exterior community noise levels can be mitigated.

2 = Allowed if interior levels can be mitigated.

TABLE 3
ORANGE COUNTY COMPATIBILITY MATRIX FOR LAND USE AND COMMUNITY NOISE EQUIVALENT LEVELS

Type of Use	65+ dB CNEL	60 to 65 dB CNEL
3 = New residential uses are prohibited in areas within the 65-dB CNEL contour from any airport or air station; allowed in other areas if interior and exterior community noise levels can be mitigated. The prohibition against new residential development excludes limited "infill" development within an established neighborhood.		
Standards Required for Compatibility of Land Use and Noise		
a = Interior Standard: CNEL of less than 45 dB (habitable rooms only).		
b = Exterior Standard: CNEL of less than 65 dB in outdoor living areas.		
c = Interior Standard: $L_{eq(h)}$ = 45 to 65 dB interior noise level, depending on interior use.		
d = Exterior Standard: $L_{eq(h)}$ of less than 65 dB in outdoor living areas.		
e = Interior Standard: As approved by the Board of Supervisors for sound events of short duration such as aircraft flyovers or individual passing railroad trains.		
Key Definitions		
Habitable Room – Any room meeting the requirements of the Uniform Building Code or other applicable regulations which is intended to be used for sleeping, living, cooking or dining purposes, excluding such enclosed spaces as closets, pantries, bath or toilet rooms, service rooms, connecting corridors, laundries, unfinished attics, foyers, storage spaces, cellars, utility rooms and similar spaces.		
Interior – Spaces that are covered and largely enclosed by walls.		
$L_{eq(h)}$ – The A-weighted equivalent sound level averaged over a period of "h" hours. An example would be $L_{eq(12)}$ where the equivalent sound level is the average over a specified 12-hour period (such as 7:00 AM to 7:00 PM). Typically, time period "h" is defined to match the hours of operation of a given type of use.		
Outdoor Living Area – Outdoor living area is a term used by the County of Orange to define spaces that are associated with residential land uses typically used for passive private recreational activities or other noise-sensitive uses. Such spaces include patio areas, barbecue areas, jacuzzi areas, and other outdoor areas associated with residential uses; outdoor patient recovery or resting areas associated with hospitals, convalescent hospitals, or rest homes; outdoor areas associated with places of worship which have a significant role in services or other noise-sensitive activities; and outdoor school facilities routinely used for educational purposes which may be adversely impacted by noise. Outdoor areas usually not included in this definition are front yard areas, driveways, greenbelts, maintenance areas, and storage areas associated with residential land uses; exterior areas at hospitals that are not used for patient activities; outdoor areas associated with places of worship and principally used for short-term social gatherings; and outdoor areas associated with school facilities that are not typically associated with educational uses prone to adverse noise impacts (for example, school play yard areas).		
Source: County of Orange 2005 (see Tables VIII-2 and VIII-3 of the Noise Element).		

Noise Ordinance

The County Noise Ordinance is codified as Title 4, Division 6 of the Codified Ordinances of the County of Orange.

(a) The following noise standards, unless otherwise specifically indicated, shall apply to all residential property within a designated noise zone:

TABLE 4
ORANGE COUNTY EXTERIOR NOISE STANDARDS

Noise Zone	Noise Level	Time Period
1	55 dBA	7:00 AM–10:00 PM
	50 dBA	10:00 PM–7:00 AM
dBA: A-weighted decibels Source: County of Orange 2015		

TABLE 5
ORANGE COUNTY INTERIOR NOISE STANDARDS

Noise Zone	Noise Level	Time Period
1	55 dBA	7:00 AM–10:00 PM
	45 dBA	10:00 PM–7:00 AM
dBA: A-weighted decibels Source: County of Orange 2015		

With respect to exterior noise levels, the Noise Ordinance states the following:

(a) In the event the alleged offensive noise consists entirely of impact noise, simple tone noise, speech, music, or any combination thereof, each of the above noise levels shall be reduced by five (5) dB(A).

(b) It shall be unlawful for any person at any location within the unincorporated area of the County to create any noise, or to allow the creation of any noise on property owned, leased, occupied, or otherwise controlled by such person, when the foregoing causes the noise level, when measured on any other residential property, either incorporated or unincorporated, to exceed:

(1) The noise standard for a cumulative period of more than thirty (30) minutes in any hour; or

(2) The noise standard plus five (5) dB(A) for a cumulative period of more than fifteen (15) minutes in any hour; or

(3) The noise standard plus ten (10) dB(A) for a cumulative period of more than five (5) minutes in any hour; or

(4) The noise standard plus fifteen (15) dB(A) for a cumulative period of more than one (1) minute in any hour; or

(5) The noise standard plus twenty (20) dB(A) for any period of time.

(c) In the event the ambient noise level exceeds any of the first four (4) noise limit categories above, the cumulative period applicable to said category shall be increased to reflect said ambient noise level. In the event the ambient noise level exceeds the fifth noise limit category, the maximum allowable noise level under said category shall be increased to reflect the maximum ambient noise level.

With respect to interior standards, the Noise Ordinance states the following:

(a) In the event the alleged offensive noise consists entirely of impact noise, simple tone noise, speech, music, or any combination thereof, each of the above noise levels shall be reduced by five (5) dB(A).

(b) It shall be unlawful for any person at any location within the unincorporated area of the County to create any noise, or to allow the creation of any noise on property owned, leased, occupied, or otherwise controlled by such person, when the foregoing causes the noise level, when measured within any other dwelling unit on any residential property, either incorporated or unincorporated, to exceed:

(1) The interior noise standard for a cumulative period of more than five (5) minutes in any hour; or

(2) The interior noise standard plus five (5) db(A) for a cumulative period of more than one (1) minute in any hour; or

(3) The interior noise standard plus ten (10) db(A) for any period of time.

(c) In the event the ambient noise level exceeds either of the first two (2) noise limit categories above, the cumulative period applicable to said category shall be increased to reflect said ambient noise level. In the event the ambient noise level exceeds the third noise limit category the maximum allowable noise level under said category shall be increased in reflect the maximum ambient noise level.

Section 4-6-7 of the Noise Ordinance exempts the following activities:

(a) Activities conducted on the grounds of any public or private nursery, elementary, intermediate or secondary school or college.

(b) Outdoor gatherings, public dances and shows, provided such events are conducted pursuant to a license issued by the County of Orange pursuant to Title 5 of the Codified Ordinances of the County of Orange.

(c) Activities conducted on any park or playground, provided such park or playground is owned and operated by a public entity.

(d) Any mechanical device, apparatus or equipment used, related to or connected with emergency machinery, vehicle or work.

(e) Noise sources associated with construction, repair, remodeling, or grading of any real property, provided said activities do not take place between the hours of 8:00 p.m. and 7:00 a.m. on weekdays, including Saturday, or at any time on Sunday or a federal holiday.

(i) Noise sources associated with the maintenance of real property, provided said activities take place between 7:00 a.m. and 8:00 p.m. on any day except Sunday or a federal holiday, or between the hours of 9:00 a.m. and 8:00 p.m. on Sunday or a federal holiday.

(j) Any activity to the extent regulation thereof has been preempted by State or federal law.

Regulatory Setting – Vibration

Public agencies have established vibration guidelines and standards to protect citizens and structures from potential structural damage and annoyance and various other adverse physiological and social effects associated with vibration. The Project is located within the County of Orange. For the evaluation of potential vibration impacts, this analysis assumes compliance with the vibration policies and regulations established by the California Department of Transportation (Caltrans).

California Department of Transportation

As is typical of most cities and counties in California, there are no applicable County standards for vibration-induced annoyance or structural damage from vibration. The California Department of Transportation (Caltrans) has adopted vibration damage thresholds, which are shown in Table 6, to assess the potential for structural damage from vibration. The structural damage threshold for "older residential structures" of 0.3 in/sec PPV for continuous/frequent (i.e., intermittent) sources is most applicable to this analysis.

TABLE 6
VIBRATION DAMAGE THRESHOLD CRITERIA

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

PPV: peak particle velocity; in/sec: inch(es) per second

Note: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

Source: Caltrans 2013.

The Caltrans vibration annoyance thresholds are shown in Table 7. These thresholds are used to assess the potential for a significant vibration impact for human annoyance; and annoyance is evaluated within occupied buildings.

TABLE 7
VIBRATION ANNOYANCE THRESHOLDS

Average Human Response	PPV
Severe	2.0
Strongly perceptible	0.9
Distinctly perceptible	0.24
Barely perceptible	0.035
PPV: peak particle velocity; in/sec: inch(es) per second Source: Caltrans 2013.	

IMPACT ANALYSIS

The following questions correspond to the questions in the Noise section of the Initial Study Checklist in Appendix G of the State CEQA Guidelines.

Question NOI-1 **Would the Project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**

Construction Noise

Construction noise occurring within the County of Orange is regulated under Section 4-6-7.e of the County Code of Ordinances. This Code exempts construction activities from the noise limits provided "Noise sources associated with construction, repair, remodeling, or grading of any real property, provided said activities do not take place between the hours of 8:00 p.m. and 7:00 a.m. on weekdays, including Saturday, or at any time on Sunday or a Federal holiday." Since construction activities may occur outside of these time periods, a variance will be obtained prior to the start of construction activities.

Construction is anticipated to start in March 2025 and the Project is expected to be completed in three years. During construction, concrete crushing would occur in one of the staging areas, which may include the primary staging area. Concrete crushing would be expected to occur generally during the day but could for approximately 3 weeks during the demolition phase of the Project.

The Project requires that some of the existing site improvements be demolished, or removed and relocated, prior to construction. The following existing features would be demolished or removed:

- Vertical outlet tower and portions of 60-inch outlet conduit
- Significant portions (or possibly all) of the spillway chute and walls
- Spillway bridge and piers
- Portions of the upstream dam embankment concrete facing
- Storage building on dam crest
- Outlet works control building and valve vault
- Outlet works energy dissipator vault
- Portions of the Irvine Lake Pipeline

- Catwalk and stair assembly across Santiago Creek
- Piezometers / Monitoring wells
- Other ancillary equipment, utilities, and facilities

Other activities, such as access road improvements, crest widenings, rock slope stabilization, and installation of erosion control measures would also be carried out prior to construction. All the pre-construction activities are addressed in the noise and vibration analyses.

The Project involves construction of multiple components that include:

- Inlet/Outlet Works
    - Inclined Inlet/Outlet Structure
    - Intake Risers and Platforms
- Downstream Outlet Works
    - Bifurcation Valve Vault
    - Emergency Outlet Valve Vault
- Spillway
- Pipelines
    - Irvine Lake Pipeline Relocation
    - Ancillary site improvements
- Inclined Inlet/Outlet Structure Access Roadway and Bridge
- Dam Control Building
- Existing Dam Crest Raise and Widening
- Emergency Access Walkway and Stairs
- Vehicle Bridge
- Additional Inundation During Operations
- Utility Relocation
- Embankment Mitigation

Primary construction access would be from Santiago Canyon Road and Blue Diamond Haul Road. The primary contractor staging and equipment storage area, as well as the required conventional concrete batch plant and construction trailers, would be located in the large, flat plateau area at the upstream end of the reservoir. The primary onsite construction access/haul road (Blue Diamond) would connect the staging area to the toe of the existing dam within the lakebed after the lake is dewatered. An earthen ramp would be constructed up the right abutment of the existing dam to provide access for construction vehicles to the downstream area to construct the outlet works and spillway stilling basin facilities. To facilitate the construction of the downstream features, a secondary staging area would be located on the downstream toe of the dam near the existing outlet structure building.

Construction of the Project would normally occur 10 hours/day during the wet season (October-April) and 20 hours/day during the dry season (April to November). The County’s Code of Ordinances limits “Noise sources associated with construction, repair, remodeling, or grading of any real property, provided said

activities do not take place between the hours of 8:00 p.m. and 7:00 a.m. on weekdays, including Saturday, or at any time on Sunday or a Federal holiday." Because construction activities would occur outside of the hours allowed within the County's Code of Ordinances, a variance would need to be obtained prior to the construction activities.

Construction noise levels for individual construction equipment reported in the Federal Highway Administration's Roadway Construction Noise Model (RCNM) were used to estimate future construction noise levels for the Project (FHWA 2008). Noise levels of construction activities from each component of the Project were assessed based on types, quantity, time frame, and distance relative to noise receptor locations. All construction equipment is anticipated to be fitted with the original equipment manufacturer or manufacturer approved equivalent mufflers or intake silencers to maintain, at minimum, published noise emission levels which were used in the calculation of offsite noise exposure from construction activities.

Typically, estimated construction noise levels are primarily influenced by equipment that produces the highest noise levels and those activities located closest to the receptor of interest. The Project consists of numerous structures that would be distributed over a large Project site. The distance between construction activities and any natural or manmade barriers provides noise attenuation for noise sensitive receptors. Noise levels during construction of each distinct Project component would vary due to the different numbers and types of construction activities/equipment. Table 8, Estimated Construction Noise Levels at Receptors, shows noise exposure levels for each of the four main activity areas associated with the Project. These include the dam area to the northwest of the Project site where the proposed upgrades to the infrastructure would occur, the primary staging area located to the southeast, the Blue Diamond haul route which runs along the southern and western perimeters of the Project's construction area, and the lakebed haul route that extends through the western portion of the lake. Each of these four construction areas were assessed for noise exposure levels at offsite residential areas, nearby parks, and habitats that may contain protected nesting areas. The range in noise exposure levels is due to the varying construction phases and associated distances of these activities that would occur between the Project and each respective noise sensitive receptor.

TABLE 8
ESTIMATED CONSTRUCTION NOISE LEVELS AT RECEPTORS

Construction Phase	Distance from Construction Activities (feet)	Noise Exposure Level (dBA L_{eq})
Construction of Main Dam Structures		
Irvine Regional Park	5,070	31-47
Residences Along Jamboree Road	9,785	25-41
Oak Canyon Park	9,035	41-57
Lakeview Park Camping Area	7,640	42-58
Sensitive Habitat to the South of Dam	140-1,300	49-86
Sensitive Habitat to the North of the Dam	150-1,370	63-84
Sensitive Habitat Near Primary Staging Area	8,300	42-57
Primary Staging Area		
Irvine Regional Park	12,700	32
Residences Along Jamboree Road	16,130	30
Oak Canyon Park	1,000	69
Lakeview Park Camping Area	1,000	69

Noise Exposure at Residential Uses

Estimated noise levels at the nearest noise sensitive uses attributable to development of the Project are shown in Table 8. As shown in this Table, Project related construction activities would occur at distances of approximately two miles from existing residential uses located to the west of the Project site. In addition to the substantial distances between the Project site and the nearest developed noise sensitive land uses, Irvine Lake is surrounded by ridgelines which attenuate noise levels. Irvine Lake is at an elevation of approximately 780 feet above sea level (asl), while many of the downstream components of the Project are located at elevations of 660 feet asl. Intervening ridgelines to the east of the dam site rise to elevations of greater than 1,000 feet asl. Noise generated by Project construction would also be attenuated by these ridgelines. As shown in Table8, noise levels are expected to range from 25 to 41 dBA L_{eq} at the exterior areas of the nearest noise sensitive residential uses. Noise exposure from Project construction activities would occur during both daytime and nighttime activities. Noise generated during Project construction would be below the FTA's daytime and nighttime Leq criteria and the County's interior and exterior daytime and nighttime Leq thresholds for residential land uses. Noise exposure levels during noisiest Project construction periods would be approximately 46 dBA CNEL at exterior areas of the nearest residential land uses. Such noise levels would be substantially less than the exterior noise compatibility standard of 65 dBA CNEL. Interior noise exposure levels at these residences would be further reduced by approximately 20 dBA under a windows-closed condition and 12 dBA under a windows-open condition, resulting in interior noise levels less than 45 dBA CNEL. In addition, construction noise from the Project site may not be discernible with traffic noise occurring along the

SR-261 and SR-241. As such, noise impacts from Project related daytime and nighttime construction activities would result in less than significant noise impacts.

Noise Exposure at Nearby Park Uses

The nearest parks located proximate to the Project construction activities include Oak Canyon Park, Irvine Lake, and Irvine Regional Park. Irvine Regional Park is located approximately one mile northwest of the northernmost Project construction activities. Irvine Regional Park is also located such that intervening ridgelines with elevations greater than 1,000 feet provide substantial noise attenuation from the Project's construction activities. As shown in Table 8, construction noise exposure levels are anticipated to range from 31 to 47 dBA L_{eq} at Irvine Regional Park. These relatively low levels of noise exposure would be due to attenuation caused by sound spreading loss and obstruction of the line-of-sight between the Project site and the Irvine Reginal Park.

Irvine Lake would remain open, with the exception of select areas proximate to the Project construction which would be closed for safety reasons. Irvine Lake would also be affected by noise occurring at the Project's construction areas. Noise exposure levels throughout the lake area would be affected by proximity to construction activities. The degree of noise exposure is highly dependent on the proximity of lake users relative to the Project construction activities.

Oak Canyon Park is located approximately 1.7 miles from the Project's dam construction activities. As shown in Table 8, construction noise levels from activities occurring at the dam would be substantially attenuated due to the distance between the dam and the park with noise exposure levels of 41 to 57 dBA L_{eq}. However, Oak Canyon Park is located adjacent to the proposed primary staging area. The primary staging area is anticipated to be used for staging construction management trailers, materials, equipment, conventional concrete batch plant, and the concrete crushing operation. The concrete crushing operation involves the delivery of concrete from demolished structures that would be crushed for use in the concrete batch plant. The concrete batch plant would be supported by haul trucks transporting cement and aggregates as well as concrete trucks transporting concrete for use in the dam improvements. Concrete crushing would be expected to occur generally during the day and intermittently at night for approximately 3 weeks, during the demolition phase of the Project. The park would mostly be exposed to noise associated with activities occurring at the staging area where equipment and materials will be stored, concrete batching activities and concrete crushing activities. Equipment staging is expected to occur during the beginning and end of each work shift when equipment would be either taken out of or returned to the staging area. Material staging would involve the temporary storage of building materials, excavated aggregates, and soil storage piles. The delivery and removal of materials in the staging area would occur throughout the day and would involve haul trucks transporting these materials. With the exception of concrete crushing activities, construction related activities associated with the staging area would occur intermittently. Concrete crushing activities would generally occur during the day but could occur for up to 20 hours a day for a period of approximately three weeks. Concrete crushing activity would be the loudest Project construction activity, generating noise levels of 95 dBA L_{eq} at a distance of 50 feet (DEC 2001) prior to the installation of sound barriers. Assuming that the concrete crusher is located at least 1,000 feet away (this distance has been confirmed by the Applicant), noise exposure levels at Oak Canyon Park are estimated to be 69 dBA L_{eq}. The Federal Transit Administration's (FTA) Transit Noise and Vibration Impact Assessment Manual (FTA 2018) has developed construction impact guidelines shown in Table 9.

TABLE 9
CONSTRUCTION NOISE CRITERIA

1-Hour Criteria (Leq)		
Land Use	**Day**	**Night**
Residential	90	80
Commercial	100	100
Industrial	100	100
8-Hour Criteria (L_{eq})		
Land Use	**Day**	**Night**
Residential	80	70
Commercial	85	85
Industrial	90	90

There are no construction noise criteria for parks. Residential uses are considered to be the most noise sensitive land use. Noise levels of 69 dBA L_{eq} from the staging area would not exceed the 80 dBA L_{eq} daytime and 70 dBA L_{eq} nighttime noise criteria and consequently would not expose Oak Canyon Park to excessive levels of noise.

The Lakeview Park Camping Area would be exposed to similar levels of noise as those at Oak Canyon Park, due to the large distance from the dam site and the proximity to the primary staging area. Noise levels from construction activities at the dam site range from 42 to 58 dBA L_{eq}. This park is proximate to construction activities occurring at the primary staging area and would likewise be exposed to daytime noise from these activities. Noise levels are estimated to be 69 dBA L_{eq} from the primary staging area. Daytime noise exposure of this level would not exceed the daytime noise criterion of 80 dBA L_{eq} established by the FTA. No camping is allowed at Irvine Lake (OC Parks 2023) so there would be no nighttime noise exposure. Noise from project-related construction noise would result in less than significant noise impacts at the Oak Canyon Park and Lakeview Park Camping Area.

Noise Exposure at Nearest Sensitive Habitat

Noise levels within the adjacent sensitive habitat are expected to average 61 dBA. The predominant source of noise that would affect this receptor would be the haul trucks. A more detailed analysis regarding construction noise impacts to biological resources is presented in the Biological Resources section of the EIR. Mitigation has been proposed in that section of the EIR that would reduce any noise impacts to biological resources to levels that are less than significant.

Operational Noise

During the operations phase of the Project, dam operations would continue consistent with operations prior to the infrastructure improvements. Under existing conditions, a small number of vehicle trips are associated with routine inspection and maintenance at the existing dam. It is anticipated that routine inspection and maintenance trips would continue, and no new operational trips would occur with implementation of the proposed Project. Therefore, because there would be no increase in vehicular trips associated with daily operation of the Project components, no Project related traffic noise impacts are anticipated. New stationary sources of noise are due to small compressors used for aeration within the reservoir. Due to the very large distances between these compressors and offsite noise sensitive land uses and its location within a concrete masonry unit building, noise related to these compressors would be inaudible. Impacts would be less than significant and no mitigation is necessary.

Question NOI-2 Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Less than Significant Impact. Demolition activities, excavation, infrastructure development, and repaving would occur at the Project site around Irvine Lake. Vibration annoyance and building damage from typical construction activities have the potential to be excessive at nearfield distances of 100 feet or less. Because of the very substantial distances between the Project site and the nearest buildings, vibration induced annoyance and building damage would not occur. The operations phase of the Project would not involve machinery or activities that generate perceptible levels of vibration. There would be a less than significant impact, and no mitigation is required.

Question NOI-3 For a project located within the vicinity of a private airstrip or an airport land use plan or, where such plan has not been adopted, within two miles of a public airport or public use airport, would the Project result in exposure of people residing or working in the Project area to excessive noise levels?

No Impact. The Project Site is not located within two miles of a public or private airport. The Project site is located approximately 10 miles northeast of John Wayne Airport. Helicopter operations have historically been conducted at Irvine Lake. Noise associated with these activities are intermittent and generally a substantial distance from workers at the dam. As such, the Project would not result in exposure of people residing or working in the Project area to excessive noise levels. Therefore, there would be no significant impact related to excessive aircraft noise exposure.

MITIGATION MEASURES

No significant noise or vibration impacts would occur from either the construction or operations phases of the Project. As such, no mitigation measures are necessary or recommended.

CUMULATIVE NOISE AND VIBRATION IMPACTS

Cumulative Short Term (Construction) Noise and Vibration Impact

Adverse noise and vibration impacts during construction of the proposed Project would be localized and would occur intermittently for varying periods of time throughout the construction period. Short-term cumulative impacts related to ambient noise and vibration levels could occur if construction associated with the proposed Project as well as surrounding current and future development were to occur simultaneously. Noise or vibration associated with construction of the proposed Project in combination with another project within approximately 500 feet of the Project site boundaries could adversely impact sensitive receptors in the vicinity of the site with a cumulative noise level greater than the noise generated solely at the Project site. Due to the remote location of the Project site, it is not likely that construction activities from other projects within 500 feet of the Project site would occur concurrently with those of the Project. Any construction noise impacts from other concurrent projects located at greater distances than 500 feet from the Project site would be solely due to the other projects. As such, cumulative noise impacts related to construction activities would result in less than significant noise impacts.

Cumulative Long-Term (Operations) Noise Impact

Cumulative traffic noise impacts would not occur due to the minimal vehicle trips required for maintenance of Project facilities and equipment. Stationary sources of machinery noise are minimal and would not result in a substantial increase in ambient noise levels in the local area. Additionally, noise produced during long-term operations would be regulated under the County's Code of Ordinances.

Lastly, the Project's operations are located at such distances that there would not be a substantial increase in noise due to cumulative contributions from other sources. As such, impacts associated with cumulative long-term noise would be less than significant, and no mitigation is required.

CONCLUSION

The proposed Project was analyzed for potential noise and vibration impacts from both the construction and operational phases. The Project's construction activities would result in less than significant noise impacts to local parks and more distant residential uses. The operations phase of the Project would result in minimal noise levels compared to conditions prior to the development of the Project and would result in less than significant impacts. Groundborne vibration and groundborne noise levels generated during construction would have less than significant impacts due to the very localized nature of vibration transmission and the substantial distances between construction activities and receptors that could be potentially affected. The Project would also not result in the exposure of people residing or working in the Project area to excessive noise levels from private or public airports.

Thank you for the opportunity to assist on this Project. If you have any questions or comments, please contact me at (714) 481-8057.

Sincerely,

PSOMAS
