Re: Notice of Preparation for the Santiago Creek Dam Outlet Tower and Spillway Improvements Project Environmental Impact Report

Dear Mr. Uk:

The Transportation Corridor Agencies (TCA) appreciate the opportunity to participate and provide comments on the Notice of Preparation for an Environmental Impact Report (EIR) for the Santiago Creek Dam Outlet Tower and Spillway Improvements Project (Proposed Project). TCA understands that the Proposed Project includes the demolition, rehabilitation and replacement of the Santiago Creek Damn outlet works and spillway facilities in unincorporated Orange County. TCA thanks you for the opportunity to participate in your planning process.

TCA looks forward to receiving all future notices, the draft EIR, along with any other forthcoming documentation for the Proposed Project and requests to be kept on IRWD's distribution list. If you have questions or require additional information, please do not hesitate to contact me at 949.754.3487 or via email (vgomez@thetollroads.com).

Sincerely,

Virginia Gomez

Subject: Santiago Creek Dam Outlet Tower and Spillway Improvements Project, Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR), SCH# 2023050097

Dear Andy Uk:

The California Department of Fish and Wildlife (CDFW) received a Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) from Irvine Ranch Water District (IRWD) for the Santiago Creek Dam Outlet Tower and Spillway Improvements Project (Project) pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.

Thank you for the opportunity to provide comments and recommendations regarding the activities involved in Santiago Creek Dam Outlet Tower and Spillway Improvements Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW Role

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & G. Code, §§ 711.7, subdivision (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

related activities that have the potential to adversely affect state fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 et seq.). CDFW also administers the Natural Community Conservation Planning (NCCP) program, a California regional habitat conservation planning program. The Irvine Ranch Water District (IRWD) participates in the NCCP program through its role as a Participating Landowner under the County of Orange Central and Coastal Subregion Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP). To the extent implementation of the Project as proposed may result in "take" (see Fish & G. Code, § 2050) of any species protected under the California Endangered Species Act (CESA; Fish & G. Code, § 2050 et seq.) or the Native Plant Protection Act (NPPA; Fish & G. Code, §1900 et seq.), CDFW recommends the Project proponent obtain appropriate authorization under the Fish and Game Code.

PROJECT DESCRIPTION SUMMARY

Proponent: Irvine Ranch Water District

Objective: IRWD and Serrano Water District (SWD) have been working to evaluate the different structural elements of the existing Santiago Creek Dam including the analysis for seismic retrofits or replacement of the outlet tower. After the evaluation, the Division of Safety of Dams (DSOD) requested that the tower and spillway need to be improved because the current design does not meet current construction standards. The improvements and replacement of the Santiago Creek Dam outlet tower and spillway facilities are necessary to address the seismic safety concerns and to meet current DSOD regulatory standards. The proposed Project involves demolishing existing structures, including the outlet tower, spillway, portions of the upstream dam embankment concrete facing, storage building on the dam crest, portions of the outlet works, portions of the Irvine Lake pipeline (ILP), catwalks/stairs across Santiago Creek, and piezometers/monitoring wells. The existing spillway will be replaced with a new side-channel spillway at the left abutment. The Project also includes raising the spillway 6 feet to 797.9 feet, which is 2 feet higher than current water storage elevation.

Location: The Project is located at the Santiago Creek Dam at the northwest end of Irvine Lake in Orange County, California. The Project site is south of State Route (SR) 261 and east of SR 241 and Santiago Road. The Project is also located in the Central and Coastal Subregion NCCP/HCP. The Santiago Dam is in "Non-Reserve Open Space." The surrounding land uses include NCCP/HCP Reserve which include Irvine Regional Park, Limestone Canyon Regional Park, and Oak Canyon Park.

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

Biological Setting: As stated above, the Project site is located in "Non-Reserve Open Space within the NCCP/HCP plan area. The area surrounding the lake and dam is largely undeveloped and includes sensitive habitat. Per the Initial Study (IS), the habitat types that occur in the survey area include: sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland, southern sycamore-coast live oak riparian woodland, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, and western sycamore and vegetated fluctuating shoreline. Other land cover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental vegetation, and developed areas associated with the lake.

The Project site has the potential to support several sensitive wildlife species, including but not limited to coastal California gnatcatcher (*Polioptila californica californica*; Federal Endangered Species Act listed-threatened (ESA), California Species of Special Concern (SSC), NCCP/HCP Covered Species)), least Bell's vireo (*Vireo bellii pusillus;* ESA listed endangered, California Endangered Species Act (CESA) listed endangered, NCCP/HCP Covered Species)), coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*; SSC, NCCP/HCP Covered Species), bald eagle (*Haliaeetus leucocephalus*; California Fully Protected Species), western spadefoot (*Spea Hammondii*; SSC, NCCP/HCP Covered Species), orange-throated whiptail (*Aspidoscelis hyperythra*; NCCP/HCP Covered Species), two-striped gartersnake (*Thamnophis hammondii*; SSC), western mastiff bat (*Eumops perotis californicus*; SSC), and pallid bat (*Antrozous pallidus*; SSC).

The Project site also has the potential to support a variety of sensitive plant species including but not limited to intermediate mariposa lily (*Calochortus weedii var. intermedius*; California Rare Plant Rank (CRPR) 1B.2, NCCP/HCP Covered Species)), Allen's pentachaeta (*Pentachaeta aurea ssp. Allenii*; CRPR 1B.1), chaparral nolina (*Nolina cismontana*; CRPR 1B.2), Braunton's milk-vetch (*Astragalus brauntonii*; ESA listed-endangered, CRPR 1B.1), white rabbit-tobacco (*Pseudognaphalium leucocephalum*; CRPE 2B.2), and many-stemmed dudleya (*Dudleya multicaulis*; CRPR 1B.2).

Project Timeline: The Project would take approximately three years to complete. The initial construction schedule anticipates that the spillway and inclined outlet structure improvements would be constructed over multiple dry seasons.

COMMENTS AND RECOMMENDATIONS

CDFW offers the following comments and recommendations to assist IRWD in identifying and/or mitigating Project impacts on biological resources to ensure regional

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

conservation objectives in the County of Orange Central and Coastal Subregion NCCP/HCP are met and the Project is compliant with the NCCP/HCP.

Specific Comments

1) Biological Direct, Indirect, and Cumulative Impacts. This Project includes the use of heavy machinery for the construction of the new dam facilities. An increased amount of noise and artificial light are associated with construction activities. Artificial light can change normal wildlife behavior, often altering their nesting and foraging behavior. Edge effects, such as light pollution, are known to result in extirpation of species from an area. Due to the proximity of the Project site to sensitive habitat types and to Santiago Creek, it is essential to understand how the open space and biological diversity within it may be impacted by Project activities. This area is part of an essential wildlife corridor and open space that supports biological diversity in the area. CDFW recommends providing a thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources, with specific measures to offset such impacts. The following should be addressed in the DEIR:

    a) A discussion regarding indirect Project impacts on biological resources, including resources in nearby public lands, open space, adjacent natural habitats, riparian ecosystems, and any designated and/or proposed or existing reserve lands (e.g., preserve lands associated with an NCCP (NCCP, Fish & G. Code, § 2800 et. seq.). Impacts on, and maintenance of, wildlife corridor/movement areas, including access to undisturbed habitats in adjacent areas, should be fully evaluated in the DEIR;

    b) A discussion of potential adverse impacts from lighting, noise, temporary and permanent human activity, and exotic species and identification of any mitigation measures;

    c) A discussion on Project-related changes on drainage patterns downstream of the Project site; the volume, velocity, and frequency of existing and post-Project surface flows; polluted runoff; soil erosion and/or sedimentation in streams and water bodies; and post-Project fate of runoff from the Project site. Mitigation measures proposed to alleviate such Project impacts should be included;

    d) An analysis of impacts from land use designations and zoning located nearby or adjacent to natural areas that may inadvertently contribute to wildlife-human interactions. A discussion of possible conflicts and mitigation measures to reduce these conflicts should be included in the DEIR; and,

    e) A cumulative effects analysis, as described under CEQA Guidelines section 15130. General and specific plans, as well as past, present, and anticipated

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

future projects, should be analyzed relative to their impacts on similar plant communities and wildlife habitats.

2) Sensitive Bird Species. Based on the location of the Project, there is potential for special-status bird species. Project activities occurring during the breeding season of nesting birds could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment in habitat directly adjacent to the Project boundary. The Project could also lead to the loss of foraging habitat for sensitive bird species.

   a) CDFW recommends that measures be taken, primarily, to avoid Project impacts to nesting birds. Migratory nongame native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA) of 1918 (Code of Federal Regulations, Title 50, § 10.13). Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests including raptors and other migratory nongame birds (as listed under the MBTA).

   b) Project activities including (but not limited to) staging and disturbances to native and nonnative vegetation, structures, and substrates should occur outside of the avian breeding season which generally runs from February 15 through August 31 (as early as January 1 for some raptors) to avoid take of birds or their eggs. If avoidance of the avian breeding season is not feasible, CDFW recommends surveys by a qualified biologist with experience in conducting breeding bird surveys to detect protected native birds occurring in suitable nesting habitat that is to be disturbed and (as access to adjacent areas allows) any other such habitat within 300-feet of the disturbance area (within 500-feet for raptors). Project personnel, including all contractors working onsite, should be instructed on the sensitivity of the area. Reductions in the nest buffer distance may be appropriate depending on the avian species involved, ambient levels of human activity, screening vegetation, or possibly other factors.

3) Coastal California Gnatcatcher and Least Bell's Vireo. There is a strong possibility that these two species occur on or near the Project site. The DEIR should include a complete, recent habitat assessment for suitable coastal California gnatcatcher (*Polioptila californica californica*) and least Bell's vireo (*Vireo bellii pusillus*) habitat. If suitable habitat for the coastal California gnatcatcher and least Bell's vireo is present onsite or adjacent to the Project site, CDFW recommends protocol level surveys for gnatcatcher and vireo to determine presence or absence of this species. Mitigation for direct, indirect, and cumulative impacts to this species should be determined after the completion of these surveys.

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

4) Biological Baseline Assessment. CDFW recommends providing a complete assessment and impact analysis of the flora and fauna within and adjacent to the Project site, with emphasis upon identifying endangered, threatened, sensitive, regionally, and locally unique species, including any Covered Species under the NCCP/HCP, and sensitive habitats. The Project impact analysis should therefore address direct, indirect, and cumulative biological impacts, as well as provide specific mitigation or avoidance measures necessary to offset those impacts. The DEIR should include the following information:

   a) A complete floristic assessment within and adjacent to the Project area, with particular emphasis upon identifying endangered, threatened, sensitive, and locally unique species and sensitive habitats. This should include a thorough, recent, floristic-based assessment of special status plants and natural communities.

   b) A complete, recent, assessment of the biological resources associated with each habitat type onsite and within adjacent areas that could also be affected by the Project. CDFW's California Natural Diversity Database (CNDDB) should be reviewed to obtain current information on any previously reported sensitive species and habitat. CDFW recommends that CNDDB Field Survey Forms be completed and submitted to CNDDB to document survey results. Online forms can be obtained and submitted at https://wildlife.ca.gov/Data/CNDDB/Submitting-Data.

   c) Vegetation mapping should follow criteria and definitions developed for the subregional NCCP/HCP. More specifically, areas of the property which may show invasion by non-native forbs (e.g., mustards, etc.) should nonetheless be identified as non-native grassland vegetation and any impacts mitigated accordingly. Such areas should not be categorized as 'Disturbed' or ruderal unless there is strong documentation that the property had been subject to an authorized use which caused a truly disturbed condition of the vegetation.

   d) The DEIR should have a complete, recent, assessment of rare, threatened, and endangered, and other sensitive species onsite and within the area of potential effect, including California Species of Special Concern and California Fully Protected Species (Fish & G. Code, §§ 3511, 4700, 5050 and 5515). Species to be addressed should include all those which meet the CEQA definition of endangered, rare, or threatened species (CEQA Guidelines, § 15380). Seasonal variations in use of the Project area should also be addressed. Focused species-specific surveys, conducted at the appropriate time of year and time of day when the sensitive species are active or otherwise identifiable, are necessary. Acceptable species-specific survey procedures should be developed in consultation with CDFW and USFWS; and,

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

e) A recent, wildlife and rare plant survey. CDFW generally considers biological field assessments for wildlife to be valid for a one-year period, and assessments for rare plants may be considered valid for a period of up to three years as long as there was not a prevailing drought during the time of the botanical survey. Some aspects of the proposed Project may warrant periodic updated surveys for certain sensitive taxa, particularly if build out could occur over a protracted time frame, or in phases.

General Comments

1) County of Orange Central and Coastal Subregion Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) CDFW issued Natural Community Conservation Plan Approval and Take authorization for the County of Orange Central and Coastal Subregion NCCP/HCP (Central and Coastal NCCP/HCP) per section 2800, et seq., of the California Fish and Game Code on July 17, 1996. The Central and Coastal NCCP/HCP establishes a multiple species conservation program to minimize and mitigate habitat loss and provides for the incidental take of covered species in association with activities covered under the permit.

   Compliance with approved habitat plans, such as Central and Coastal (NCCP/HCP), is discussed in CEQA. Specifically, section 15125(d) of the CEQA Guidelines requires that the CEQA document discuss any inconsistencies between a proposed Project and applicable general plans and regional plans, including habitat conservation plans and natural community conservation plans. An assessment of the impacts to the Central and Coastal NCCP/HCP as a result of this Project is necessary to address CEQA requirements.

   The proposed Project occurs within the area and is subject to the provisions and policies of the Central and Coastal NCCP/HCP. To be considered a covered activity, Permittees need to demonstrate that proposed actions are consistent with the Central and Coastal NCCP/HCP and its associated Implementing Agreement.

2) Lake and Streambed: Santiago Creek is located just east of the Project site. Santiago Creek is a blueline stream which enters Irvine Lake and continues downstream to the dam flowing north to west, ultimately reaching the Santa Ana River. This Project will impact the watersheds surrounding Santiago Dam and Irvine Lake. CDFW has regulatory authority over activities in streams and/or lakes that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of any river, stream, or lake or use material from a river, stream, or lake. For any such activities, the Project applicant (or "entity") must provide written notification to CDFW pursuant to section 1600 et seq. of the Fish and Game Code. Based on this notification and other information, CDFW

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

determines whether a Lake and Streambed Alteration Agreement (LSAA) with the applicant is required prior to conducting the proposed activities. CDFW's issuance of an LSAA for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. To minimize additional requirements by CDFW pursuant to section 1600 et seq. and/or under CEQA, the DEIR should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSAA. CDFW recommends the Applicant submit a Lake and Streambed Alteration Notification to CDFW.

3) Mitigation and Avoidance of Project-Related Biological Impacts: The DEIR should include mitigation measures for adverse project-related impacts to sensitive plants, animals, and habitats. Mitigation measures should emphasize avoidance and reduction of project impacts. For unavoidable impacts, onsite habitat restoration or enhancement should be discussed in detail. If onsite mitigation is not feasible or would not be biologically viable and therefore not adequately mitigate the loss of biological functions and values, offsite mitigation through habitat creation and/or acquisition and preservation in perpetuity should be addressed.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a data base which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNNDB field survey form can be found at the following link: https://wildlife.ca.gov/Data/CNDDB/Submitting-Data
The completed form can be mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. The types of information reported to CNDDB can be found at the following link:
http://www.dfg.ca.gov/biogeodata/cnddb/plants_and_animals.asp.

FILING FEES

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.)

DocuSign Envelope ID: 3AB6556C-251C-4170-A8CD-18F882A4E819

CONCLUSION

CDFW appreciates the opportunity to comment on the NOP to assist IRWD in identifying and mitigating Project impacts on biological resources and ensuring Project consistency with the requirement of County of Orange Central and Coastal Subregion NCCP/HCP.

Questions regarding this letter or further coordination regarding the implementation of the Central and Coastal NCCP/HCP should be directed to Emily Gray, Environmental Scientist, at Emily.Gray@wildlife.ca.gov.

Sincerely,

Subject: Air Quality and Greenhouse Gas Emissions Technical Memorandum for the Santiago Creek Dam Outlet and Spillway Improvements Project

Dear Mr. Uk:

This Letter Report presents the results of the air quality and greenhouse gas (GHG) emissions analyses for the proposed Santiago Creek Dam Outlet and Spillway Improvements Project in unincorporated Orange County, California (hereinafter referred to as the "Project"). This analysis addresses the potential air quality impacts associated with the Project in accordance with the California Environmental Quality Act (CEQA) (California Public Resources Code §21000 et seq.) and the State CEQA Guidelines (California Code of Regulations, Title 14, §15000 et seq.).

PROJECT SETTING AND DESCRIPTION

The proposed Project would include rehabilitation and replacement of the Santiago Creek Dam outlet works and spillway facilities, necessary to address identified seismic and dam safety concerns. The Project involves dewatering, demolition activities, and construction of inlet/outlet works, downstream outlet works, pipelines, ancillary site improvements, and utility relocation. The Project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in Unincorporated Orange County, California. The Project site location is shown on Exhibit 1-1 and 1-2, Regional Location and Aerial Photograph, and is described in more detail below.

AIR QUALITY ANALYSIS

The Project site is located in the Orange County portion of the South Coast Air Basin (SoCAB), and, for air quality regulation and permitting, is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The SoCAB is a 6,600-square-mile area bound by the Pacific Ocean to the west; the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east; and the San Diego County line to the south. The SoCAB includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The SoCAB's terrain and geographical location (i.e., a coastal plain with connecting broad valleys and low hills) determine its distinctive semi-arid climate, which is characterized by moderate temperatures, oceanic influence, and precipitation that is limited to a few storms during the winter (i.e., November through April).

Regulatory Background

Air quality in the SoCAB is regulated by the USEPA, CARB, and the SCAQMD. Each of these agencies develops rules, regulations, policies, and/or goals to comply with applicable legislation. Although USEPA regulations may not be superseded, both State and local regulations may be more stringent. The Southern California Association of Governments (SCAG) is an important partner to the SCAQMD and produces estimates of anticipated future growth and vehicular travel in the basin that are used for air quality planning. The federal, State, regional, and local regulations for CAPs and TACs are discussed below.

Federal

The Federal Clean Air Act (CAA) requires the adoption of National Ambient Air Quality Standards (NAAQS), which are periodically updated to protect the public health and welfare from the effects of air pollution. The USEPA is responsible for setting and enforcing the NAAQS for criteria pollutants. Primary standards set limits to protect public health, including the health of at-risk populations such as people with pre-existing heart or lung disease (such as asthmatics), children, and older adults. Secondary standards set limits to protect public welfare, including protection against visibility impairment as well as damage to animals, crops, vegetation, and buildings.

Current federal standards are set for Ozone (O3), carbon monoxide (CO), nitrogen dioxide (NO2), sulfur dioxide (SO2), particulate of <10 microns (PM10), particulates of <2.5 microns (PM2.5), and lead. These pollutants are called criteria pollutants because the USEPA has established National Ambient Air Quality Standards (NAAQS) for the concentrations of these pollutants. CARB has also established standards for the criteria pollutants, known as California Ambient Air Quality Standards (CAAQS), and the State standards are generally more restrictive than the NAAQS. When a region has air quality that fails to meet the standards, the USEPA and the CARB designate the region as “nonattainment” and the regional air quality agency must develop plans to attain the standards. NAAQS are shown above in Table 1.

TABLE 1
CALIFORNIA AND FEDERAL AMBIENT AIR QUALITY STANDARDS

Pollutant	Averaging Time	California Standards	Federal Standards	
			Primary[a]	Secondary[b]
O_3	1 Hour	0.09 ppm (180 µg/m^3)	–	–
	8 Hour	0.070 ppm (137 µg/m^3)	0.070 ppm (137 µg/m^3)	Same as Primary
PM10	24 Hour	50 µg/m^3	150 µg/m^3	Same as Primary
	AAM	20 µg/m^3	–	Same as Primary
PM2.5	24 Hour	–	35 µg/m^3	Same as Primary
	AAM	12 µg/m^3	12.0 µg/m^3	15.0 µg/m^3
CO	1 Hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	–
	8 Hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	–
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)	–	–
NO_2	AAM	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as Primary
	1 Hour	0.18 ppm (339 µg/m^3)	0.100 ppm (188 µg/m^3)	–
SO_2	24 Hour	0.04 ppm (105 µg/m^3)	–	–
	3 Hour	–	–	0.5 ppm (1,300 µg/m^3)
	1 Hour	0.25 ppm (655 µg/m^3)	0.075 ppm (196 µg/m^3)	–
Lead	30-day Avg.	1.5 µg/m^3	–	–
	Calendar Quarter	–	1.5 µg/m^3	Same as Primary
	Rolling 3-month Avg.	–	0.15 µg/m^3	
Visibility Reducing Particles	8 Hour	Extinction coefficient of 0.23 per km – visibility ≥ 10 miles (0.07 per km – ≥30 miles for Lake Tahoe)	**No Federal Standards**	
Sulfates	24 Hour	25 µg/m^3		
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m^3)		
Vinyl Chloride	24 Hour	0.01 ppm (26 µg/m^3)		

O_3: ozone; ppm: parts per million; µg/m^3: micrograms per cubic meter; PM10: respirable particulate matter 10 microns or less in diameter; AAM: Annual Arithmetic Mean; –: No Standard; PM2.5: fine particulate matter 2.5 microns or less in diameter; CO: carbon monoxide; mg/m^3: milligrams per cubic meter; NO_2: nitrogen dioxide; SO_2: sulfur dioxide; km: kilometer.

[a] *National Primary Standards:* The levels of air quality necessary, within an adequate margin of safety, to protect the public health.

[b] *National Secondary Standards:* The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

Note: More detailed information in the data presented in this table can be found at the CARB website (www.arb.ca.gov).

Source: CARB 2016

Specific geographic areas are classified as either “attainment” or “nonattainment” areas for each pollutant based upon the comparison of measured data with the NAAQS. Attainment areas have concentrations of the criteria pollutant that are below the NAAQS, and a Nonattainment classification indicates the criteria pollutant concentrations have exceeded the NAAQS. When an area has been reclassified from a nonattainment to an attainment area for a federal standard, the status is identified as “maintenance”, and there must be a plan and measures that will keep the region in attainment for the following ten years. Areas designated as nonattainment are required to prepare regional air quality plans, which set forth a strategy for bringing an area into compliance with the standards. These regional air quality plans, which are developed to meet federal requirements, are included in an overall program referred to as the State Implementation Plan (SIP).

State of California

CARB, a part of the California Environmental Protection Agency (CalEPA), has also established the California Ambient Air Quality Standards (CAAQS) shown in Table 1, which are generally more restrictive than the NAAQS. CARB conducts research; compiles emissions inventories; develops suggested control measures; provides oversight of local programs; and prepares the SIP. For regions that do not attain the CAAQS, CARB requires the air districts to prepare plans for attaining the standards. CARB establishes emissions standards for motor vehicles sold in California, consumer products (e.g., hair spray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

Based on monitored air pollutant concentrations, the USEPA and the CARB designate an area’s status in attaining the NAAQS and the CAAQS, respectively, for selected criteria pollutants. These attainment designations are shown in Table 2. As identified in Table 2, Orange County is a nonattainment area for O3, PM10, and PM2.5.

TABLE 2
ATTAINMENT STATUS OF CRITERIA POLLUTANTS
IN THE SOUTH COAST AIR BASIN

Pollutant	State	Federal
O_3 (1 hour)	Nonattainment	No standard
O_3 (8 hour)		Extreme Nonattainment
PM10	Nonattainment	Attainment/Maintenance
PM2.5	Nonattainment	Serious Nonattainment
CO	Attainment	Attainment/Maintenance
NO_2	Attainment	Attainment/Maintenance
SO_2	Attainment	Attainment
Lead	Attainment	Attainment/Nonattainment*
All others	Attainment/Unclassified	No standards

O_3: ozone; PM10: respirable particulate matter 10 microns or less in diameter; PM2.5: fine particulate matter 2.5 microns or less in diameter; CO: carbon monoxide; NO_2: nitrogen dioxide; SO_2: sulfur dioxide; SoCAB: South Coast Air Basin.

* Los Angeles County is classified nonattainment for lead; the remainder of the SoCAB is in attainment of the State and federal standards.

Regional

South Coast Air Quality Management District and Southern California Association of Governments

In the SoCAB, the SCAQMD is the agency responsible for protecting public health and welfare through the administration of federal and State air quality laws, regulations, and policies. Included in the SCAQMD's tasks are the monitoring of air pollution; the preparation of the Air Quality Management Plan (AQMP) for the SoCAB; and the promulgation of rules and regulations.

In the Project area, SCAG is the federally designated Metropolitan Planning Organization and the State-designated transportation planning agency for six counties: Riverside, San Bernardino, Los Angeles, Ventura, Imperial, and Orange. On June 5, 2020, SCAG's Regional Council adopted the 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (Connect Socal). The RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The RTP/SCS includes a strong commitment to reduce emissions from transportation sources in order to improve public health, to meet the NAAQS as set forth by the CAA.

The SCAQMD and SCAG are jointly responsible for formulating and implementing the AQMP for the SoCAB. SCAG's Regional Mobility Plan and Growth Management Plan form the basis for the land use and transportation control portion of the AQMP.

Air Quality Management Plan

Air quality in Orange County is partially regulated by the SCAQMD, which is the agency principally responsible for comprehensive air pollution control in the SoCAB. The SCAQMD develops rules and regulations; establishes permitting requirements for stationary sources; inspects emissions sources; and enforces such measures through educational programs or fines, when necessary. The SCAQMD is directly responsible for reducing emissions from stationary (area and point), mobile, and indirect sources.

The Federal CAA requires the preparation of plans to demonstrate attainment of the NAAQS for which an area is designated as being in nonattainment. Furthermore, the CAA requires the revision of these plans every three years to address reducing pollutant concentrations that exceed the CAAQS. The SCAQMD and SCAG, in coordination with local governments and the private sector, develop the Air Quality Management Plan (AQMP) for the SoCAB to satisfy these requirements. The AQMP is the most important air management document for the SoCAB because it provides the blueprint for meeting State and federal ambient air quality standards.

The current regional plan applicable to the Project is the SCAQMD's 2022 AQMP. The SCAQMD is responsible for ensuring that the SoCAB meets the NAAQS and CAAQS by reducing emissions from stationary (area and point), mobile, and indirect sources. To accomplish this goal, the SCAQMD prepares AQMPs in conjunction with the SCAG, County transportation commissions, and local governments; develops rules and regulations; establishes permitting requirements for stationary sources; inspects emissions sources; and enforces such measures through educational programs or fines, when necessary.

The 2022 AQMP was adopted on December 2, 2022, by the SCAQMD Governing Board. The 2022 AQMP evaluates integrated strategies and measures to meet the following NAAQS (SCAQMD 2022):

- 8-hour O_3 target of 80 parts per billion (ppb) by 2024, 75 ppb by 2032, 70 ppb by 2038;
- Annual PM2.5 (12 micrograms per cubic meter [$\mu g/m^3$]) by 2025;

- 1-hour O_3 (120 ppb) by 2023; and
- 24-hour PM2.5 (35 µg/m^3) by 2023.

South Coast Air Quality Management District Rules

The Project will be required to comply with existing SCAQMD rules for the reduction of fugitive dust and criteria pollutant emissions. The following rules are most relevant to the proposed Project:

SCAQMD Rule 201 requires a "Permit to Construct" prior to the installation of any equipment "the use of which may cause the issuance of air contaminants . . ." and Regulation II provides the requirements for the application for a Permit to Construct. Rule 203 similarly requires a Permit to Operate. Rule 219, Equipment not Requiring a Written Permit Pursuant to Regulation II, identifies "equipment, processes, or operations that emit small amounts of contaminants that shall not require written permits . . ."

SCAQMD Rule 402, Nuisance, states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property".

SCAQMD Rule 403, Fugitive Dust, requires actions to prevent, reduce, or mitigate fugitive particulate matter emissions. These actions include applying water or chemical stabilizers to disturbed soils; managing haul road dust by applying water; covering all haul vehicles before transporting materials; restricting vehicle speeds on unpaved roads to 15 miles per hour (mph); and sweeping loose dirt from paved site access roadways used by construction vehicles. In addition, Rule 403 requires that vegetative ground cover be established on disturbance areas that are inactive within 30 days after active operations have ceased. Alternatively, an application of dust suppressants can be applied in sufficient quantity and frequency to maintain a stable surface. Rule 403 also requires grading and excavation activities to cease when winds exceed 25 mph.

SCAQMD Rule 1113 governs the sale of architectural coatings and limits the VOC content in paints and paint solvents. Although this rule does not directly apply to the Project, it does dictate the VOC content of paints available for use during building construction.

Local

Unincorporated Orange County

There are no County regulations applicable to the Project's potential impacts on air quality. However, the Orange County General Plan addresses air quality in the unincorporated territory where the Project takes place. Within its Transportation Element, updated in 2020, the General Plan states that it is responsive to the Air Quality Management District (AQMD) objectives, and regional planning objectives of the Southern California Association of Governments (SCAG).[1] Similarly, the Land Use Element notes that "the purpose of the Enhancement of Environment Policy is to ensure that all land use activities seek to enhance the physical environment, including the air, water, sound levels, landscape, and plant and animal

[1] Orange County General Plan, Transportation Element Update 2020. Accessed June 2023, https://ocds.ocpublicworks.com/sites/ocpwocds/files/2020-12/Chapter%20IV-%20Transportation%202020.pdf

life."[2] The Resources Element (2013) has the most robust discussion on air quality affecting the area. It advances the goal to promote optimum sustainable environmental standards for air resources with an explicit policy to develop and support programs which improve air quality or reduce air pollutant emissions.[3] The Project is consistent with these General Plan goals, plans, and objectives to enhance the physical environment including air and water in Orange County.

Pollutants

The U.S. Environmental Protection Agency (USEPA) defines seven "criteria" air pollutants: SO_2, CO, NO_2, O_3, PM_{10}, $PM_{2.5}$, and lead. The characteristics and health effects of these criteria pollutants are described below:

Ozone (O_3)

O_3 is a secondary pollutant; it is not directly emitted. O_3 is formed by chemical reactions between VOCs (also referred to as reactive organic gasses [ROGs]) and NOx, which occur only in the presence of bright sunlight. VOC/ROG emissions are generally unburned hydrocarbons that are a result of motor vehicle travel and other combustion sources. Nitrogen oxides are also a result of the combustion process, most notably due to the operation of motor vehicles. Sunlight and hot weather cause ground-level $O_3$to form. (Not to be confused with the "ozone layer" which occurs very high in the atmosphere and shields the planet from some ultraviolet [UV] rays.) As a result, O_3 is known as a summertime air pollutant. Ground-level ozone is the primary constituent of smog. Because ground-level ozone is formed in the atmosphere, high concentrations can occur in areas well away from sources of its constituent pollutants.

People with lung disease, children, older adults, and people who are active are the most sensitive when O_3 levels are unhealthy. Numerous scientific studies have linked ground-level O_3 exposure to a variety of health problems, including:

- lung irritation that can cause inflammation much like a sunburn;
- wheezing, coughing, pain when taking a deep breath, and breathing difficulties during exercise or outdoor activities;
- permanent lung damage to those with repeated exposure to O_3 pollution; and
- aggravated asthma, reduced lung capacity, and increased susceptibility to respiratory illnesses like pneumonia and bronchitis.

Ground-level O_3 can also have detrimental effects on plants and ecosystems. These effects include:

- interfering with the ability of sensitive plants to produce and store food, making them more susceptible to certain diseases, insects, other pollutants, competition, and harsh weather;
- damaging the leaves of trees and other plants, negatively impacting the appearance of urban vegetation, national parks, and recreation areas; and

- reducing crop yields and forest growth, potentially impacting species diversity in ecosystems.

Currently, the SoCAB is designated as a "Nonattainment Area" for the State and federal O_3 standards.

Particulate Matter (PM_{10}, $PM_{2.5}$, and UFP)

Particulate matter includes both aerosols and solid particles of a wide range of size and composition. Of particular concern are inhalable particulate matter, which are those particles equal to or smaller than 10 microns in size (PM_{10}); fine particulate matter, which are particles smaller than or equal to 2.5 microns ($PM_{2.5}$); and ultrafine particulate matter (UFP), which are particles less than 0.1 micron. The size of the particulate matter refers to the aerodynamic diameter of the particulate. Smaller particulates are of greater concern because they can penetrate deeper into the lungs than large particles. $PM_{2.5}$ is directly emitted in combustion exhaust and fugitive dust and is formed from atmospheric reactions between various gaseous pollutants, including NOx, SOx, and VOCs. PM_{10} is directly emitted as a result of mechanical processes that crush or grind larger particles or from the re-suspension of dusts most typically through construction activities and vehicular travels. $PM_{2.5}$ and PM_{10} can remain suspended in the atmosphere for days and/or weeks and can be transported long distances. Ultrafine particles are the smallest particles and are good indicators of any kind of fuel burning, from diesel engines to refinery operations.

The principal health effects of airborne particulate matter are on the respiratory and cardiac systems. According to the USEPA, some people are more sensitive than others to breathing fine particles (USEPA 2023). People with influenza, chronic respiratory and cardiovascular diseases, and the elderly may suffer worsening illness and premature death due to breathing these fine particles. People with bronchitis can expect aggravated symptoms from breathing in fine particles. Children may experience decline in lung function due to breathing in PM_{10} and $PM_{2.5}$. Other groups considered sensitive are smokers and people who cannot breathe well through their noses. Exercising athletes are also considered sensitive, because many breathe through their mouths. However, all people exposed to elevated levels of particulate matter may experience temporary health effects (USEPA 2016a).

Short-term exposure to high $PM_{2.5}$ levels is associated with premature mortality and increased hospital admissions and emergency room visits. Long-term exposure to high $PM_{2.5}$ levels is associated with premature mortality and development of chronic respiratory disease. Short-term exposure to high PM_{10} levels is associated with hospital admissions for cardiopulmonary diseases, increased respiratory symptoms, and possible premature mortality. There are national and State 24-hour PM_{10} standards, but there is no annual long-term standard. With respect to long-term PM_{10} health effects, the USEPA concluded in a 2006 standards review that analysis of air quality data showed that the 24-hour PM_{10} standard generally resulted in annual average PM_{10} levels at or below the annual standard of 50 $\mu g/m^3$ and that available evidence did not suggest an association between long-term exposure to PM_{10} at 2006 ambient levels and health problems. Based on this conclusion, the national PM_{10} annual standard was revoked (USEPA 2006). However, California maintains an annual PM_{10} standard.

No federal or State standards have been established for UFP. Currently, PM_{10} levels in the SoCAB is designated as "Nonattainment areas" for State standards and "Attainment/Maintenance areas" for federal standards. $PM_{2.5}$ levels in the SoCAB are designated as "Nonattainment areas" for State and federal standards.

Carbon Monoxide (CO)

CO is a colorless and odorless gas which, in the urban environment, is associated primarily with the incomplete combustion of fossil fuels in motor vehicles. CO combines with hemoglobin in the

bloodstream and reduces the amount of oxygen that can be circulated through the body. High CO concentrations can lead to headaches, aggravation of cardiovascular disease, and impairment of central nervous system functions. Carbon monoxide concentrations can vary greatly over comparatively short distances. Relatively high concentrations are typically found near crowded intersections; along heavily used roadways carrying slow moving traffic; and at or near ground level. Even under the most severe meteorological and traffic conditions, high CO concentrations are limited to locations within a relatively short distance (i.e., up to 600 feet or 185 meters) of heavily traveled roadways. Overall, CO emissions are decreasing as a result of the Federal Motor Vehicle Control Program, which has mandated increasingly lower emission levels for vehicles manufactured since 1973.

Currently, CO levels in the SoCAB are in attainment for State and federal one-hour and eight-hour standards.

Nitrogen Dioxide (NO2)

Nitrogen gas, normally relatively inert (unreactive), comprises about 80 percent of the air. At high temperatures (i.e., in the combustion process) and under certain other conditions it can combine with oxygen to form several different gaseous compounds collectively called nitrogen oxides (NOx). NO is converted to NO_2, a red-brown pungent gas, in the atmosphere. Motor vehicle emissions are the main source of NOx in urban areas.

NO_2 is toxic to various animals and to humans. Its toxicity relates to its ability to form nitric acid with water in the eye, lung, mucus membrane, and skin. In animals, long-term exposure to NOx increases susceptibility to respiratory infections lowering their resistance to such diseases as pneumonia and influenza. Laboratory studies show susceptible humans, such as asthmatics, exposed to high concentrations of NO_2 can suffer lung irritation and, potentially, lung damage. Epidemiological studies have also shown associations between NO_2 concentrations and daily mortality from respiratory and cardiovascular causes and with hospital admissions for respiratory conditions.

NOx is primarily a combination of NO and NO_2. While the NAAQS and CAAQS only address NO_2, the total group of nitrogen oxides is of concern. NO and NO_2 are both precursors in the formation of O_3 and $PM_{2.5}$. Because of this and the fact that NO emissions largely convert to NO_2, NOx emissions are typically examined when assessing potential air quality impacts. Currently, NO_2 levels in the SoCAB are in attainment for State and federal standards.

Sulfur Dioxide (SO2)

Sulfur oxides (SOx) constitute a class of compounds of which SO_2 and sulfur trioxide (SO_3) are included. Ninety-five percent of pollution-related SOx emissions are in the form of SO_2. SOx emissions are typically examined when assessing potential air quality impacts of SO_2. Combustion of fossil fuels for generation of electric power is the primary contributor of SOx emissions. Industrial processes, such as nonferrous metal smelting, also contribute to SOx emissions. SOx is also formed during combustion of motor fuels. However, most of the sulfur has been removed from fuels, greatly reducing SOx emissions from vehicles.

SO_2 combines easily with water vapor, forming aerosols of sulfurous acid (H_2SO_3), a colorless, mildly corrosive liquid. This liquid may then combine with oxygen in the air, forming the even more irritating and corrosive sulfuric acid (H_2SO_4). Peak levels of SO_2 in the air can cause temporary breathing difficulty for people with asthma who are active outdoors. Longer-term exposures to high levels of SO_2 gas and particles cause respiratory illness and aggravate existing heart disease. SO_2 reacts with other chemicals in

the air to form tiny sulfate particles which are measured as $PM_{2.5}$. SO_2 is monitored at several sites in the SoCAB and is in attainment for the State and federal SO_2 standards.

Lead

Lead is a stable compound, which persists and accumulates both in the environment and in animals. In humans, it affects the blood-forming (or hematopoietic), the nervous, and the renal systems. In addition, lead has been shown to affect the normal functions of the reproductive, endocrine, hepatic, cardiovascular, immunological, and gastrointestinal systems, although there is significant individual variability in response to lead exposure. Since 1975, lead emissions have been in decline due in part to the introduction of catalyst-equipped vehicles and the decline in production of leaded gasoline. In general, an analysis of lead is limited to projects that emit significant quantities of the pollutant (e.g., lead smelters, battery manufacturers, and battery recyclers) and are not undertaken for transportation, residential, or commercial development projects. The SoCAB is in attainment for the State lead standard. The Los Angeles County portion of the SoCAB is classified nonattainment for the federal lead standard. Orange County is in attainment for the federal standard.

Visibility Reducing Particles

Visibility reducing particles consist of suspended particulate matter, which is a complex mixture of tiny particles that consist of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt. The State standard is intended to limit the frequency and severity of visibility impairment due to regional haze. The SoCAB is “unclassified” for this pollutant. There are no federal standards for visibility reducing particulates.

Sulfates (SO_4)

Sulfates (SO_4) are the fully oxidized ionic form of sulfur. SO_4 occurs in combination with metal and/or hydrogen ions. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. This sulfur is oxidized to SO_2 during the combustion process and subsequently converted to sulfate compounds in the atmosphere. The conversion of SO_2 to SO_4 takes place comparatively rapidly and completely in California urban areas due to regional meteorological features.

The CARB’s SO_4 standard is designed to prevent aggravation of respiratory symptoms. Effects of SO_4 exposure at levels above the standard include a decrease in respiratory function; aggravation of asthmatic symptoms; and an increased risk of cardiopulmonary disease. SO_4 is particularly effective in degrading visibility and, due to fact that it is usually acidic, can harm ecosystems and damage materials and property. The SoCAB is in attainment for the State SO_4 standard.

Hydrogen Sulfide (H_2S)

H_2S is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. It can also be present in sewer gas and some natural gas, and it can be emitted as the result of geothermal energy exploitation. Breathing H_2S at levels above the standard will result in exposure to a very disagreeable odor. In 1984, a CARB committee concluded that the ambient standard for H_2S is adequate to protect public health and to significantly reduce odor annoyance (CARB 2009). The SoCAB is “unclassified” for this pollutant.

Vinyl Chloride (Chloroethene)

Vinyl chloride (chloroethene), a chlorinated hydrocarbon, is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents.

Short-term exposure to high levels of vinyl chloride in air causes central nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure to vinyl chloride through inhalation and oral exposure causes liver damage. Cancer is a major concern from exposure to vinyl chloride via inhalation. Vinyl chloride exposure has been shown to increase the risk of angiosarcoma, a rare form of liver cancer in humans. Vinyl chloride is not routinely measured in the SoCAB. California has a vinyl chloride standard, but there is no corresponding federal standard.

Toxic Air Contaminants

In addition to criteria air pollutants, toxic air contaminants (TACs) emitted from mobile and stationary sources must be taken into consideration for projects proposing new sources of TAC emissions. TACs are those pollutants that are known or suspected to cause cancer or other serious health effects (e.g., reproductive effects or birth defects) or adverse environmental effects.

Installation and operation of stationary equipment that emit TACs generally require permits from the applicable air district, and a Health Risk Assessment (HRA) of TAC emissions may be a requirement under the permitting process. Land uses that would result in a long-term increase in mobile TAC emissions (e.g., distribution centers with diesel emissions from delivery trucks) also may require the preparation of an HRA. The HRA evaluates the risks posed to sensitive receptors (e.g., residents, schools, hospitals, and parks) in the vicinity of proposed TAC source(s) and must not exceed significance thresholds. Significance thresholds have been established in terms of cancer risk and hazard index.

Carcinogenic risks (i.e., cancer risks) are estimated as the incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a probability (e.g., 10 in 1 million). Hazard indices (HIs) express the potential for chemicals to result in non-cancer health impacts, and non-carcinogenic chemicals should not be present at levels expected to cause adverse health effects (i.e., HI greater than one). HIs are expressed using decimal notation (e.g., 0.001). If there is a reference exposure level of greater than 1, then impacts would be considered potentially significant. The National Contingency Plan (NCP, in accordance with *Code of Federal Regulations* [CFR], Title 40, Part 300) is commonly cited as the basis for target risk and hazard levels. According to the NCP, lifetime incremental cancer risks posed by a site should not exceed the range of between 1 in 1 million and 100 in 1 million.

Diesel Particulate Matter

Diesel particulate matter (DPM) is part of a complex mixture that makes up diesel exhaust emitted from a broad range of diesel engines, including on-road diesel engines of trucks, buses, and cars and the off-road road diesel engines that include locomotives, marine vessels, and heavy-duty equipment. Diesel exhaust is composed of gas and particles. The gas phase is composed of many urban hazardous air pollutants, such as acetaldehyde, benzene, and formaldehyde. The particle phase includes categories of fine and ultra-fine particles that, when inhaled, can cause immunological effects including lung inflammation and cellular changes in the lung. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings. In 1998, the California Office of

Environmental Health Hazards (OEHHA) listed diesel PM as a TAC based on its potential to cause cancer and other adverse health effects. Under California regulatory guidelines, diesel exhaust, as a mixture, is identified as a known carcinogen.

Methodology

California Emission Estimator Model

Proposed Project emissions were calculated by using California Emissions Estimator Model (CalEEMod) version 2022.1.1.20 (CAPCOA 2023). CalEEMod is a computer program accepted by the SCAQMD that can be used to estimate criteria pollutant and GHG emissions associated with land development projects in California. CalEEMod has separate databases for specific Counties and air districts. The Orange County database was used for the Project. The model calculates emissions of CO, SO_2, PM_{10}, $PM_{2.5}$, and the O_3 precursors VOC and NOx. For this analysis, the results are expressed in pounds per day (lbs/day) and are compared with the SCAQMD mass daily thresholds to determine impact significance.

Specific inputs to CalEEMod include land uses and acreages. Construction input data include, but are not limited to, (1) the anticipated start and finish dates of each Project construction activity (e.g., grading, building, and paving); (2) inventories of construction equipment to be used during each Project activity; (3) areas to be excavated and graded for development; (4) volumes of materials to be imported to and exported from the Project site; (5) areas to be paved; and (6) areas to be painted. The input data and assumptions are discussed in Section 4.2.6 below and are shown in notes on the CalEEMod data in Attachment A. The CalEEMod has the capability to calculate reductions in construction emissions from the effects of dust control, off-road diesel-engine classifications, low-emission paints, and other selected measures.

Due to the lack of changes in operations between the existing dam and conditions under the dam improvements, operations phase emissions have been addressed qualitatively.

Local Concentrations of Criteria Pollutants from On-Site Sources

As part of the SCAQMD's environmental justice program, attention has focused on localized effects of air quality and the exposure of persons to criteria pollutants generated on a project site. The SCAQMD developed localized significance threshold (LST) methodology and mass rate look-up tables that public agencies can use to determine whether or not a project may generate significant adverse localized air quality impacts. In addition to the mass daily emissions for regional thresholds, the SCAQMD established California Environmental Quality Act (CEQA) significance thresholds for ambient air quality to address localized impacts. The localized impact analysis is based on the concentration of a pollutant at a receptor site. The concentration standard is either the same as the NAAQS or CAAQS or is based upon a health-based standard. It is possible for a pollutant to have a significant impact regionally and a less than significant impact locally or vice versa. It is also possible for both impacts (i.e., regional and local) to be significant or less than significant. The look-up tables allow the evaluation of impacts without the complex task of dispersion modeling.

The analysis is not performed for operations because there would be no substantial on-site stationary sources of criteria pollutants with the proposed Project. The LST methodology translates the concentration standards into emissions thresholds.

The LST methodology addresses NO_2, CO, PM_{10}, and $PM_{2.5}$ emissions. SO_2 and lead are not included because these pollutants are generated in very small amounts in development projects. Ozone is not

included because it is a secondary pollutant and local concentrations cannot be estimated from precursor emissions. For NO_2 and CO, the one-hour standards are used and receptors that could be exposed for one hour are considered. For PM_{10} and $PM_{2.5}$, the 24-hour standards are used and the receptors of interest are those where persons could be exposed for 24 hours, such as residences. Because emissions are based on the AAQS, exceedance of the LST represents a potential health impact. As noted above, even if a standard is exceeded, the potential impact can be confirmed or found to be less than significant by a more detailed analysis.

Sensitive Air Quality Receptors

Sensitive receptors include, but are not limited to, children, the elderly, persons with preexisting respiratory or cardiovascular illness, and athletes and others who engage in frequent exercise. These sensitive receptors include, but are not limited to, schools, athletic facilities, hospitals, residential areas, parks, and convalescent homes. The Project site is located in a remote area with the nearest residential land uses located approximately 9500 feet to the west. There are nearby parks which include Oak Canyon Park, Irvine Regional Park, and Irvine Lake Park.

Existing Air Quality Conditions

Air quality data for the Project site is represented by the Saddleback Valley monitoring station located in Lake Forest. Pollutants measured at the Saddleback Valley Monitoring Station include Carbon monoxide (CO), ozone (O_3), respirable particulate matter with a diameter of 10 microns or less (PM10), fine particulate matter with a diameter of 2.5 microns or less (PM2.5) and Nitrogen dioxide (NO_2). The monitoring data presented in Table 3, Air Quality Levels Measured at the Saddleback Valley Monitoring Station, were obtained from the CARB and SCAQMD. Federal and State air quality standards are presented with the number of times those standards were exceeded.

TABLE 3
AIR QUALITY LEVELS MEASURED AT THE
SADDLEBACK VALLEY MONITORING STATION

Pollutant	California Standard	National Standard	Year	Max. Level	Days State Standard Exceeded	Days National Standard Exceeded

—: Data Not Reported or insufficient data available to determine the value; O_3: ozone; ppm: parts per million; PM10: respirable particulate matter with a diameter of 10 microns or less; µg/m^3: micrograms per cubic meter; AAM: Annual Arithmetic Mean; NO_2: nitrogen dioxide; PM2.5: fine particulate matter with a diameter of 2.5 microns or less. N/A indicates that there is no applicable standard.

[a] Data from the SCAQMD.

[b] Data from the CARB.

Source: CARB 2022. SCAQMD 2021.

The monitoring data shows that O_3 is the air pollutant of primary concern in the Project area. At the monitoring station, the State 1-hour O_3 standards was exceeded 2-20 days between 2020-2022 The state and federal O_3 8-hour standards were also exceeded 8-32 days for the same time period. O_3 is a secondary pollutant and is not directly emitted from a source; it occurs as the result of photochemical reactions from ozone precursors, which include VOCs and NO_2 and sunlight.

Air Quality Impact Analysis

Thresholds of Significance

The SCAQMD's Air Quality Analysis Handbook (CEQA Handbook) provides significance thresholds for both construction and operation of projects within the SCAQMD's jurisdictional boundaries (SCAQMD 2023). The SCAQMD recommends that projects be evaluated in terms of the quantitative thresholds established to assess both the regional and localized impacts of project-related air pollutant emissions. The County of Orange uses the current SCAQMD thresholds to determine whether a proposed project would have a significant impact. These SCAQMD thresholds are identified in Table 4. The following questions correspond to the questions in the Air Quality section of the Initial Study Checklist in Appendix G of the State CEQA Guidelines.

TABLE 4
SOUTH COAST AIR QUALITY MANAGEMENT
DISTRICT AIR QUALITY SIGNIFICANCE THRESHOLDS

Mass Daily Thresholds (lbs/day)		
Pollutant	**Construction**	**Operation**
VOC	75	55
NOx	100	55
CO	550	550
PM10	150	150
PM2.5	55	55
SOx	150	150
Lead	3	3

lbs/day: pounds per day; VOC: volatile organic compound; NOx: nitrogen oxides; CO: carbon monoxide; PM10: respirable particulate matter 10 microns or less in diameter; PM2.5: fine particulate matter 2.5 microns or less in diameter; SOx: sulfur oxides.

Source: SCAQMD 2023.

The following questions correspond to the questions in the Air Quality section of the Initial Study Checklist in Appendix G of the State CEQA Guidelines.

Question AQ-1 Would the Project conflict with or obstruct implementation of the applicable air quality plan?

Significant and Unavoidable Impact. The SCAQMD develops rules and regulations; establishes permitting requirements for stationary sources; inspects emissions sources; and enforces such measures through educational programs or fines, when necessary. It is directly responsible for reducing emissions from stationary (area and point), mobile, and indirect sources and has prepared an Air Quality

Management Plans (AQMP) that establishes a program of rules and regulations directed at attaining the NAAQS and CAAQS. As discussed previously, the current regional plan applicable to the Project is the SCAQMD's 2022 AQMP.

The main purpose of an AQMP is to bring an area into compliance with the requirements of federal and State air quality standards. For a project to be consistent with the AQMP, the pollutants emitted from the project should not (1) exceed the SCAQMD CEQA air quality significance thresholds or (2) conflict with or exceed the assumptions in the AQMP. As shown in Threshold AQ-2 below, pollutant emissions from the proposed Project would exceed the SCAQMD thresholds and would result in a significant impact even with the implementation of mitigation measures and SCAQMD regulatory requirements. The General Plan designates the Project site as Open Space (5) (County of Orange 2022); additionally, the Project site falls within an Open Space Reserve (OSR) overlay. The Open Space (5) designation indicates the current and near-term use of the land, while the OSR overlay identifies lands of scenic and natural attraction, and areas of ecological, cultural, historical and recreational significance that are permanently preserved as and restricted to open space and compatible uses (County of Orange 2022). The County's General Plan allows for the development of water resource areas within these designations; moreover, the proposed is consistent with existing uses at the Project site. As such, the Project is consistent with the Zoning and Land Use designation of the County's General Plan General Plans of cities and counties within the SoCAB are used to determine the regional emissions of the Basin, emissions related to the development of the Project site is therefore consistent with the growth expectations for the region. While the operations phase of the Project is consistent with the AQMP, construction emissions associated with the Project would exceed the SCAQMD's significance thresholds despite the implementation of MM AQ-1. As such, the Project's construction activities would conflict with the 2022 AQMP's goal of reducing criteria pollutant emissions. Consequently, the Project would in a temporary unavoidable significant impact related to consistency with the AQMP.

Question AQ-2 Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in non-attainment under an applicable federal or State ambient air quality standard?

Significant and Unavoidable Impact. A project may have a significant impact where project-related emissions would exceed federal, State, or regional standards or thresholds, or where project-related emissions would substantially contribute to an existing or projected air quality violation. As identified in Table 2, Orange County is a nonattainment area for O_3, PM10, and PM2.5. The Project would generate PM10, PM2.5, NO_2, and O_3 precursors (NOx and VOC) during short-term construction and long-term operations. The SCAQMD has developed construction and operations thresholds to determine whether projects would considerably contribute toward a violation of ambient air quality standards. A project with daily emission rates below the SCAQMD's established air quality significance thresholds (shown previously in Table 4) would have a less than significant effect on regional air quality. Project emissions were estimated using the CalEEMod. CalEEMod is designed to model construction and operational emissions for land development projects and allows for the input of project- and county-specific information. CalEEMod modeling results can be found in Attachment A.

Construction Emissions

Air pollutant emissions would occur from construction equipment exhaust, grading; exhaust and particulate emissions from trucks hauling building materials to and from the Project site; from automobiles and light trucks driven to and from the Project site by construction workers; and VOCs from minor painting and asphalt paving operations. The proposed Project would comply with applicable SCAQMD rules and regulations, including Rule 403 for fugitive dust control and Rule 1113 for architectural coatings. Rule

403 measures include regular watering of active grading areas and unpaved roads, limiting vehicle speeds on unpaved surfaces, stabilizing stockpiled earth, and curtailing grading operations during high wind conditions. Watering of active grading areas is included in the CalEEMod emissions analysis and results in reduced PM10 and PM2.5 emissions. The emission reductions associated with compliance with Rule 403 have been included in the emissions calculations.

Regional Emissions Thresholds – Maximum Daily Regional Emissions

Project construction activities are those associated with the development of the Project components. Table 5, presents the estimated unmitigated maximum daily emissions during construction of the Project and compares the estimated emissions with the SCAQMD's daily regional emission thresholds.

TABLE 5
UNMITIGATED PROJECT MAXIMUM DAILY REGIONAL CONSTRUCTION EMISSIONS

Year	Emissions (lbs./day)					
	VOC	NOx	CO	SOx	PM10	PM2.5
Summer						
2024	5	49	43	<1	5	2

Source: SCAQMD 2019 (thresholds); see Attachment B for CalEEMod model outputs.

As shown in Table 5, Project related construction emissions of VOC, NOx, and CO would exceed the SCAQMD's significance thresholds and would result in a significant impact to regional air quality prior to the implementation of mitigation measures.

The Project would implement **MM AQ-1** which requires use of Tier 4 offroad construction engines to minimize emissions during the development of the Project. Table 6 shows the emissions with the use of cleaner engines required under **MM AQ-1.**

TABLE 6
MITIGATED PROJECT MAXIMUM DAILY REGIONAL CONSTRUCTION EMISSIONS

Year	Emissions (lbs./day)

Source: SCAQMD 2019 (thresholds); see Attachment B for CalEEMod model outputs.

As shown in Table 6, after implementation of **MM AQ-1**, Project construction would continue to exceed the established thresholds for VOC, CO, and NOx for Maximum Daily Regional Construction Emissions. Additionally, as shown in Table 6, implementation of **MM AQ**-1 requiring use of Tier 4 offroad engine standards may result in higher CO emissions than for equipment with other engine standards. While CO emissions are higher with implementation of **MM AQ-1**, VOCs and NOx would be reduced. VOCs and NOx contribute to ozone (smog) which has more health/environmental implications than CO; additionally, the region is in a state of attainment for CO pursuant to the ambient air quality standards. Therefore **MM AQ-1** would reduce overall impacts associated with this threshold. Because the Project would exceed the SCAQMD's construction emissions thresholds despite implementation of mitigation, construction emissions would be cumulatively considerable, and the impact would be significant and unavoidable.

Operational Emissions

The Project involves improvements to existing dam infrastructure and would not result in substantial increases in air pollutant sources such as vehicular or energy consumption. Existing operations related to dam inspection and maintenance activities would be comparable to that which would occur under the Proposed Project; no new vehicle trips associated with regular maintenance and operations beyond existing conditions are assumed. As such, air pollutant emissions would likewise be essentially the same and due to the minimal amount of vehicular and energy usage, the Project's operational phase would not result in an exceedance of the SCAQMD's operations phase thresholds and would not result in a significant impact related to operations phase emissions contributions to regional air quality.

Cumulative Impacts

The SCAQMD, in their White Paper on Regulatory Options for Addressing Cumulative Impacts from Air Pollution Emissions (presented to the Board on September 5, 2003), identifies that impacts that are less than significant on a Project level are also considered to be less than significant on a cumulative basis. The AQMD uses the same significance thresholds for project-specific and cumulative impacts analyzed in an Environmental Assessment or Environmental Impact Report, except for the Hazard Index for toxic air contaminant emissions (SCAQMD 2003). Any projects that are found to result in less than significant impacts on a project level are not considered to be cumulatively considerable and consequently would not result in a considerable contribution to cumulative impacts. After implementation of **MM AQ-1**, Project construction would result in significant construction-related regional air quality impacts, as quantified above in Tables 5 and 6 respectively. Since the SCAQMD recommends that a project's potential contribution to cumulative impacts be assessed utilizing the same significance criteria as those for project-specific impacts, the Project's unavoidable significant air quality impacts related to construction would likewise be cumulatively considerable.

Question AQ-3 Would the Project result in exposure of sensitive receptors to substantial pollutant concentrations?

Less than Significant Impact. Exposure of sensitive receptors is addressed for the following situations: CO hotspots; criteria pollutants from on-site construction; and TACs from on-site construction.

Carbon Monoxide Hotspot

A CO hotspot is an area of elevated CO concentrations that is caused by severe vehicle congestion on major roadways, typically near intersections. If a project substantially increases average delay at signalized intersections that are operating at Level of Service (LOS) E or F or causes an intersection that would operate at LOS D or better without the Project to operate at LOS E or F with the Project, there is a potential for a CO hotspot. As such, a CO hotspot is an area of localized CO pollution caused by severe vehicle congestion on major roadways, typically near intersections. The Project would not result in a substantial change in vehicle trips associated with the operation of the dam infrastructure. Existing operations of the dam involves minimal amounts of vehicle trips associated with maintenance and inspection operations which does not substantially result in local traffic congestion. Therefore, the proposed Project would not increase congestion or result in a significant impact related to CO hotspots.

Criteria Pollutants from On-Site Construction

In addition to the mass daily emissions thresholds, the SCAQMD has developed localized significance thresholds (LSTs) to evaluate short-term localized impacts to nearby sensitive receptors from on-site emissions of NO_2, CO, PM_{10}, and $PM_{2.5}$. LSTs represent the maximum emissions that can be generated at a project site without expecting to cause or substantially contribute to an exceedance of the most stringent national or state ambient air quality standards. LSTs are based on the distance to the nearest sensitive receptor and the ambient concentrations of pollutants within a project's source receptor area (SRA). The SCAQMD provides LST lookup tables for one-, two-, and five-acre projects emitting CO, NOX, PM2.5, and/or PM10. The assessment of localized air quality impacts was developed to provide a conservative estimate of the level of Project-generated air pollutants that have the potential to exceed the NAAQS or CAAQS, which could consequently result in adverse health impacts. Exceedance of these air quality standards does not describe the prevalence, magnitude, or specific health effects, but rather assesses the potential for a Project-related health effect to occur.

For the purposes of an LST analysis, the SCAQMD considers receptors where it is possible that an individual could remain for 1 hour for NO_2 and CO exposure and 24 hours for PM_{10} and $PM_{2.5}$ exposure. The LSTs utilized for this analysis account for the Project site's location within SRA 19, Saddleback Valley and receptors located at 500 meters (1,640 feet)[4] of the Project site. The nearest residential uses along Jamboree Road are located approximately 2,596 meters (9,500 feet) to the west of the Project site and use of the 500-meter separation distance provides a conservative analysis of potential impacts.

The LST methodology is recommended for projects that have five acres or less of site disturbance per day. Per SCAQMD guidance, site disturbance is calculated by the number of acres a particular piece of equipment would likely disturb per day. The disturbance values provided by the SCAQMD to determine site disturbance are provided below in Table 4.2-5 SCAQMD Disturbance Area by Equipment Type.

TABLE 4.2 5
SCAQMD DISTURBANCE AREA BY EQUIPMENT TYPE

Equipment Type	Acres/8hr-day
Crawler Tractors	*0.5*
Graders	*0.5*
Rubber Tired Dozers	*0.5*
Scrapers	*1*

The Project would actively disturb a maximum of approximately 4 acres during the peak day (Roadway Excavation and Cleanup) of all construction phases. Therefore, the LST thresholds for 4 acres were used for the construction LST analysis. The emissions limits in the lookup tables are based on the SCAQMD's Ambient Air Quality Standards (SCAQMD 2016). As stated above, the Project site is located within SRA 19, Saddleback Valley and the nearest receptors are located along Jamboree Road, approximately 2,596 meters (9,500 feet) to the west of the Project site. The LSTs for receptors located at 500 meters (1,640 feet)[5] of the Project site were utilized and provides a conservative analysis of potential impacts.

Table 4.2-7, Construction-Phase Localized Significance Threshold Emissions shows the maximum daily on-site emissions for construction activities compared with the SCAQMD LST screening thresholds. The thresholds shown are from the lookup tables for a site disturbance area of 4 acres. The Project's maximum daily on-site emissions would occur during the roadway excavation and site preparation phase for all pollutants. As shown in Table 4.2-7, localized unmitigated emissions for all analyzed criteria pollutants would be less than the applicable SCAMD LSTs.

[4] The SCAQMD recommends that, when sensitive receptors are located nearer than 25 meters (82 feet) from the Project site, the minimum 25-meter/82-foot distance threshold should be used.

TABLE 4.2 7
UNMITIGATED CONSTRUCTION-PHASE
LOCALIZED SIGNIFICANCE THRESHOLD EMISSIONS

Emissions and Thresholds	Emissions (lbs/day)			
	NO_x	CO	PM_{10}	$PM_{2.5}$
Project maximum daily on-site emissions	148	147	37	19
Localized Significance Threshold	263	9,820	142	85
Exceed threshold?	No	No	No	No

lbs/day: pounds per day; NO_x: nitrogen oxides; CO: carbon monoxide; PM_{10}: respirable particulate matter 10 microns or less in diameter; $PM_{2.5}$: fine particulate matter 2.5 microns or less in diameter.

Note: Data is for SCAQMD Source Receptor Area 19, Saddleback Valley.

Source: SCAQMD 2009 (thresholds); see Appendix B for CalEEMod model outputs.

Mitigated localized construction emissions are presented in Table 4.2-8 and are likewise below the applicable SCAQMD LSTs.

TABLE 4.2 8
MITIGATED CONSTRUCTION-PHASE
LOCALIZED SIGNIFICANCE THRESHOLD EMISSIONS

Emissions and Thresholds	Emissions (lbs/day)			
	NO_x	CO	PM_{10}	$PM_{2.5}$
Project maximum daily on-site emissions	20	152	34	17
Localized Significance Threshold	263	9,820	142	85
Exceed threshold?	No	No	No	No

lbs/day: pounds per day; NO_x: nitrogen oxides; CO: carbon monoxide; PM_{10}: respirable particulate matter 10 microns or less in diameter; $PM_{2.5}$: fine particulate matter 2.5 microns or less in diameter.

Toxic Air Contaminant Emissions from On-Site Construction

Construction activities would result in short-term, Project-generated emissions of diesel particulate matter (DPM) from the exhaust of off-road, heavy-duty diesel equipment used for site preparation (e.g., excavation and grading); paving; building construction; and other miscellaneous activities. CARB identified DPM as a TAC in 1998. The dose to which receptors are exposed is the primary factor used to determine health risk. Dose is a function of the concentration of a substance or substances in the environment and the duration of exposure to the substance. Thus, the risks estimated for a maximally exposed individual are higher if a fixed exposure occurs over a longer time period. According to the Office of Environmental Health Hazard Assessment, health risk assessments—which determine the exposure of sensitive receptors to TAC emissions—should be based on a 30-year or 70-year exposure period; however, such assessments should be limited to the period/duration of activities associated with the Project.

Health risks associated with DPM are due to substantial long-term exposure to this pollutant. While there are park uses nearby, exposure to construction related DPM would occur to park visitors on a short-term

(1-7 days) and intermittent basis as compared to the same individuals at residential uses being exposed on a 24-hour basis for a period of 30 or 70-years. DPM does not have any identified health effects associated with short-term acute exposures and is evaluated relative to long-term chronic and carcinogenic exposures. As such, park uses will not be substantially affected by DPM emitted during construction activities due to the relative brevity that individual park visitors are exposed when they are at the park and the infrequency of attendance of an individual park visitor. As such, park visitors are not anticipated to be significantly affected by TACs related to construction activities. The nearest residential uses are located approximately 1.8 miles away from construction activities. This very substantial distance would disperse and dilute air pollutants generated at the Project site. As indicated in CARB's Air Quality And Land Use Handbook: A Community Health Perspective, decreases in D PM emissions occur substantially within the first 300 feet and stabilize to background levels at approximately 500 feet. Considering that the nearest residential uses are approximately 9,500 feet away, Project related construction DPM emissions would have a negligible impact on health risks at the nearest residential uses. In addition, **MM AQ-1** would result in the use of Tier 4 offroad engines which would lead to reductions in exhaust particulate emissions. As such, construction emissions of TACs would not expose sensitive receptors to substantial emissions of TACs. The impact would be less than significant.

Question AQ-4 Would the Project result in other emissions (such as those leading to odors) affecting a substantial number of people?

Less than Significant Impact. According to the SCAQMD's *CEQA Air Quality Handbook*, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (SCAQMD 1993). The Project does not propose any of these land uses and would not otherwise produce objectionable long-term operational odors. In addition, the SCAQMD has not identified dam/reservoir projects as sources of odors, which implies that dam/reservoir projects are not common sources of odor. Nevertheless, the dewatering of the reservoir for Project construction may result in the exposure organic matter, including vegetation and remains of fish. All residual organic matter would be removed from the reservoir by construction crews, in accordance with **PDF AQ-1**. Furthermore, the substantial distance between the Project site and the nearest sensitive receptors and the presence of SR-241 and SR-261 would further minimize potential odors emanating from the reservoir once the reservoir has been dewatered. During Project operations, the Project consists of dam infrastructure and would not result in any substantial onsite emissions that would result in a public nuisance.

Short-term construction equipment and activities would generate odors, such as diesel exhaust emissions from construction equipment and paving activities. There may be situations where construction activity odors would have an olfactory presence at nearby park uses, but these odors would not rise to the magnitude of a public nuisance. The odors would be temporary and would dissipate rapidly from the source with an increase in distance. The Project use is also regulated from nuisance odors or other objectionable emissions by SCAQMD Rule 402. Rule 402 prohibits discharge from any source of air contaminants or other material, which would cause injury, detriment, nuisance, or annoyance to people or the public. As such, all Project-related odors are construction related and short term in nature; no long-term operational odors would result. Consequently, the proposed Project would have less than significant impact in regard to other emissions, and no mitigation is required.

Mitigation Measures

The proposed Project would result in significant impacts related to exceedance of the SCAQMD's construction phase emission thresholds and consequently result in significant impacts to Air Quality. The following mitigation measures are necessary to minimize Project related impacts.

AQ-1 The Project's plans and specifications shall include the following measures to minimize nitrogen oxide (NOx) and volatile organic compound (VOC) emissions during construction:

- All off-road diesel-powered construction equipment greater than 50 horsepower shall meet U.S. Environmental Protection Agency (USEPA) Tier 4 Final emission standards to the extent that the equipment is available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by the California Air Resources Board (CARB). If Tier 4 Final equipment is not available, the Project Applicant/Developer shall provide the County with documentation showing the reasons for non-availability.
- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export). If the Project Applicant/Developer determines that 2010 model year or newer diesel trucks cannot be obtained, trucks that meet USEPA 2007 model year NOx emissions requirements shall be required. If 2010 model year or newer diesel trucks are not available, the Project Applicant/Developer shall provide the County with documentation showing the reasons for non-availability.
- Construction contractors shall ensure construction equipment is properly serviced and maintained to the manufacturer's standards.
- Construction contractors shall limit non-essential idling of construction equipment to no more than five consecutive minutes.

Level of Significance After Mitigation

Construction emissions from the Project would exceed the SCAQMD's regional construction emissions thresholds and would result in a significant and unavoidable impact regional air quality despite the application of mitigation measures. Localized construction emissions would be less than significant due to the large distance between the Project's construction activities and the nearest sensitive land uses. Because construction emissions would exceed the SCAQMD's regional thresholds, it would also not be consistent with the goals of the AQMP and would result in a significant impact relative to consistency with local air quality plans.

Long-term operational emissions, and exposure of sensitive receptors to long-term criteria pollutant and TAC emissions from stationary or mobile sources would be less than significant due to the lack of additional emission sources attributable to the Project. The Project would also not exceed the growth assumptions in the AQMP and would not result in impacts related to consistent with local air quality plans for the operations phase. The proposed Project would not increase congestion or result in a significant impact related to CO hotspots.

GREENHOUSE GAS EMISSIONS ANALYSIS

Relevant elements of the proposed Project related to the analysis of potential greenhouse gas (GHG) emissions impacts include construction and operations phase activities which emit GHG emissions. Construction activities which emit GHGs are related to fuel combustion from offroad construction equipment as well as worker and truck trips. The operations phase of the Project would involve GHG emissions from energy usage and vehicular trips. California has adopted several initiatives to reduce the State's contribution to global climate change. This information is incorporated by reference into this report, and information that is relevant to the analysis of GHG emissions resulting from the proposed Project is summarized in this section.

General Environmental Effects of Global Climate Change

Executive Order (EO) S-3-05 mandates the preparation of biennial science assessment reports on climate change impacts and adaptation options for California. EO S-13-08 directs the California Natural Resources Agency (CNRA) to develop a State Climate Adaptation Strategy and to provide State land use planning guidance related to sea level rise and other climate change impacts. Current reports resulting from these directed actions are the *Climate Action Team Report to the Governor and Legislature* and the *California Climate Adaptation Strategy* (CalEPA 2010; CNRA 2009). These studies report that global warming in California is anticipated to impact resources, including, but not limited to, those discussed below.

- **Public Health.** Many Californians currently experience the worst air quality in the nation, and climate change is expected to make matters worse. Higher temperatures would increase the frequency, duration, and intensity of conditions conducive to air pollution formation. If global background O_3 levels increase as predicted under some scenarios, it may become impossible to meet local air quality standards. Air quality could be further compromised by more frequent wildfires, which emit fine particulate matter that can travel long distances. Rising temperatures and more frequent heat waves would increase the risk of death from dehydration, heat stroke/exhaustion, heart attack, stroke, and respiratory distress. Climate change may also increase asthma rates and the spread of infectious diseases and their vectors, as well as challenge food and water supplies. Children, the elderly, people with chronic heart or lung disease, outdoor workers, people who exercise outdoors, and the economically disadvantaged would be particularly vulnerable to these changes. In addition, more frequent extreme weather events could also result in increased injuries and deaths from these phenomena.
- **Energy.** Increasing mean temperature and more frequent heat waves will drive up demand for cooling in summer; this new energy demand will only be partially offset by decreased demand for heating in winter. Hydropower, which currently provides 15 percent of in-state generation, would be threatened by declining snowpack, which serves as a natural reservoir for hydropower generation in the spring and summer. Winter storms, earlier snowmelt, and greater runoff may combine to cause flooding, which could, in turn, damage transmission lines and cause power outages.
- **Water Resources.** Rising temperatures, less precipitation, and more precipitation falling as rain instead of snow could severely diminish snowpack. Because the Sierra Nevada snowpack provides most of California's available water, this potential loss would increase the risk of summer water shortages and would hamper water distribution and hydropower generation. The diminished snowpack would also nearly eliminate all skiing and other snow-related recreation. Rising sea levels would push salt water into California's estuaries, wetlands, and groundwater

aquifers, threatening the water quality and reliability in the Sacramento/San Joaquin River Delta—a major California fresh water supply. Extreme precipitation and flooding could also damage water quality by creating sudden increases in runoff. Moreover, warming would increase evapotranspiration rates from plants, soil, and open water surfaces, which would result in greater demand for irrigation. Overall, climate change would reduce California's water supplies even as its growing population requires additional resources.

- **Sea Level and Flooding.** Sea level at California's coasts is expected to rise by 11 to 18 inches above 2000 levels by 2050 and by 23 to 55 inches by 2100. If realized, these increases would create more frequent and higher storm surges; would erode some coastal areas; and would increase pressure on existing levees. These increases would create a greater risk of flooding in previously untouched inland areas. Consequently, continued development in vulnerable coastal areas would put more people and infrastructure at risk.

- **Agriculture.** Although higher CO_2 levels can stimulate plant production and increase plant water-use efficiency, in the long-term, climate change would reduce the quantity and quality of agricultural products Statewide. As temperatures rise, farmers will face greater water demand for crops and a less reliable water supply, as well as increased competition from urban water users. Sea level rise may cause saltwater intrusion in the Delta region, making it difficult to raise certain crops. Rising temperatures will likely aggravate O_3 pollution, interfering with plant growth and making plants more susceptible to disease and pests. In addition, warming would reduce the number of colder hours needed for fruit and nut production; would shift pest and weed ranges; would alter crop-pollinator timing; and would increase the frequency of droughts, heat waves, and floods. Higher average temperatures would also increase mortality and decrease productivity in livestock.

- **Forestry.** California timber production has declined over the past few decades due, in part, to warming and increased wildfires. While further warming may increase production for some species in some locations, climate change is expected to reduce overall forest growth. Increasing average temperatures and drought frequency would result in more wildfires and greater burned areas, while less frequent and more intense rainfall would increase soil erosion and landslides. Higher temperatures and less water would force many tree species to shift their ranges; those that run out of livable habitat may die out. Pests, diseases, and invasive species may also colonize new areas, further challenging forest health and biodiversity.

- **Ecosystems.** Rising average temperatures would subject plants and animals to greater thermal stress, causing some species to adapt or shift their ranges, while others may face extinction. Invasive species may also shift their ranges, threatening native species. Changing temperatures would alter the timing of plant flowering and insect emergence, damaging species' abilities to reproduce. Changing precipitation patterns would impact aquatic and riparian ecosystems by reducing snow pack, stream flow, and groundwater, while increasing the frequency of droughts, floods, and wildfires. As sea levels rise, some coastal habitats may be permanently flooded or eroded, and saltwater intrusion into freshwater resources may threaten terrestrial species. Changes in ocean circulation and temperature, ocean acidification, and increased runoff and sedimentation would threaten pelagic species. In sum, continued global warming would alter natural ecosystems and threaten California's biological diversity.

Existing Greenhouse Gas Emissions Conditions

GHGs are global pollutants and are therefore unlike criteria air pollutants such as O_3, particulate matter (PM10 and PM2.5), and TACs, which are pollutants of regional and local concern. While pollutants with

localized air quality effects have relatively short atmospheric lifetimes (generally on the order of a few days), GHGs have relatively long atmospheric lifetimes, ranging from one year to several thousand years. Long atmospheric lifetimes allow for GHGs to disperse around the globe. Therefore, GHG effects are global, as opposed to the local and/or regional air quality effects of criteria air pollutant and TAC emissions.

Regulatory Background

Significant changes in global climate patterns have been associated with global warming, which is an average increase in the temperature of the atmosphere near the Earth's surface; this is attributed to an accumulation of GHG emissions in the atmosphere. GHGs trap heat in the atmosphere which, in turn, increases the Earth's surface temperature. Some GHGs occur naturally and are emitted to the atmosphere through natural processes, while others are created and emitted solely through human activities.

On June 1, 2005, Governor Arnold Schwarzenegger signed Executive Order S-3-05, which calls for a reduction in GHG emissions to the year 2000 level by 2010, to year 1990 levels by 2020, and to 80 percent below 1990 levels by 2050.

The principal overall State plan and policy adopted for the purpose of reducing GHG emissions is Assembly Bill (AB) 32 (California Global Warming Solutions Act of 2006). AB 32 establishes regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and establishes a cap on statewide GHG emissions. AB 32 recognizes that California is the source of substantial amounts of GHG emissions. The statute states the following:

> Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems.

In order to avert these consequences, AB 32 establishes a State goal of reducing GHG emissions to 1990 levels by the year 2020, codifying the Executive Order S-3-05 goal.

CARB approved a *Climate Change Scoping Plan* as required by AB 32 in 2008; this plan is required to be updated every five years. The *Climate Change Scoping Plan* proposes a "comprehensive set of actions designed to reduce overall carbon GHG emissions in California, improve our environment, reduce our dependence on oil, diversify our energy sources, save energy, create new jobs, and enhance public health" (CARB 2008). The *Climate Change Scoping Plan* has a range of GHG-reduction actions which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as a cap-and-trade system, and an AB 32 implementation regulation to fund the program. On February 10, 2014, CARB released the Draft Proposed First Update to the *Climate Change Scoping Plan* (CARB 2014). The board approved the final *First Update to the Climate Change Scoping Plan* on May 22, 2014. The first update describes California's progress towards AB 32 goals, stating that "California is on track to meet the near-term 2020 greenhouse gas limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32" (CARB 2014). The latest update occurred in January 2017 and incorporates the 40 percent reduction to 1990 emissions levels by 2030.

California Executive Order B-30-15 (April 29, 2015) set an "interim" statewide emission target to reduce GHG emissions to 40 percent below 1990 levels by 2030, and directed State agencies with jurisdiction over GHG emissions to implement measures pursuant to statutory authority to achieve this 2030 target and the 2050 target of 80 percent below 1990 levels.

On September 8, 2016, the Governor signed Senate Bill 32 (SB 32) to codify the GHG reduction goals of EO B-30-15, requiring the State to reduce GHG emissions by 40 percent below 1990 levels by 2030 (Health and Safety Code Section 38566). This goal is expected to keep the State on track to meeting the goal set by EO S-3-05 of reducing GHG emissions by 80 percent below 1990 levels by 2050 (California Legislative Information 2017a). SB 32's findings state that CARB will "achieve the state's more stringent greenhouse gas emission reductions in a manner that benefits the state's most disadvantaged communities and is transparent and accountable to the public and the Legislature."

AB 197 was signed at the same time and will make sure that the SB 32 goals are met by requiring CARB to provide annual reports of GHGs, criteria pollutants, and TACs by facility, City and subcounty level, and sector for stationary sources and at the County level for mobile sources. It also requires the CARB to prioritize specified emission reduction rules and regulations and to identify specified information for emission reduction measures (e.g., alternative compliance mechanism, market-based compliance mechanism, and potential monetary and nonmonetary incentive) when updating the Scoping Plan (California Legislative Information 2017b).

On April 29, 2015, Governor Brown signed Executive Order (EO) B-30-15, which orders "A new interim statewide greenhouse gas emission reduction target to reduce greenhouse gas emissions to 40 percent below 1990 levels by 2030 is established in order to ensure California meets its target of reducing greenhouse gas emissions to 80 percent below 1990 levels by 2050" (COOG 2015). Five key goals for reducing GHG emissions through 2030 include (1) increasing renewable electricity to 50 percent; (2) doubling the energy efficiency savings achieved in existing buildings and making heating fuels cleaner; (3) reducing petroleum use in cars and trucks by up to 50 percent; (4) reducing emissions of short-lived climate pollutants; and (5) managing farms, rangelands, forests and wetlands to increasingly store carbon. EO B-30-15 also directs CARB to update the *Climate Change Scoping Plan* to express the 2030 target in terms of million metric tons of carbon dioxide equivalent.

Senate Bill (SB) 350, signed October 7, 2015, is the Clean Energy and Pollution Reduction Act of 2015. SB 350 is the implementation of some of the goals of EO B-30-15. The objectives of SB 350 are as follows (California Legislative Information 2015):

1. To increase from 33 percent to 50 percent, the procurement of our electricity from renewable sources.
2. To double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.

The text of SB 350 sets a December 31, 2030, target for 50 percent of electricity to be generated from renewable sources.

The Sustainable Communities and Climate Protection Act of 2008, Senate Bill (SB) 375, established a process to coordinate land use planning, regional transportation plans, and funding priorities in order to help California meet the GHG reduction goals established in AB 32. SB 375 required SCAG to incorporate a "sustainable communities strategy" (SCS) into its regional transportation plans (RTPs) that will achieve GHG emission reduction targets though several measures, including land use decisions.

SCAG's SCS is included in the SCAG 2020–2045 RTP/SCS (SCAG 2020). The goals and policies of the RTP/SCS that reduce vehicle miles traveled (VMT) focus on transportation and land use planning that include building infill projects; locating residents closer to where they work and play; and designing communities so there is access to high quality transit service.

COUNTY OF ORANGE

The County of Orange's General Plan does not specifically references GHGs, however the following sections of the General Plan is relevant to the effects of climate change as it relates to Project.

General Plan

The County of Orange's General Plan provides the vision of the future and framework for development in the County. The General Plan is comprised of various elements or topical sections that cover different aspects of the County. The two Element that are most relevant to the Project are the Public Services & Facilities Element and Resources Element.

Public Services & Facilities Element

The Public Services and Facilities Element focuses on those publicly managed services and facilities which have a direct influence on the distribution and intensity of development that can be accommodated through the utilization of existing technologies and assumptions that are used to determine adequate service levels. These services include flood control, waste management, water and wastewater, transportation, and community services (fire protection, library, sheriff patrol, local special services districts and public school facilities).

Goals, Objectives, and Policies

Water System

Goal 1	Encourage the planning and development of a water conveyance and distribution system to meet the County's future demand.
Objective 1.1	To achieve desired water system service levels through the coordination of land use and water system planning.
Objective 1.2	To implement state, regional, and local facility plans for water delivery to Orange County
Objective 1.3	To increase storage and delivery capacity for water supplies in Orange County.
Policy 1	System Capacity and Phasing – To ensure the adequacy of water system capacity and phasing, in consultation with the service providing agency(ies), in order to serve existing and future development as defined by the General Plan.
Policy 2	Water Delivery System – To support water facility planning and development efforts for Orange County water supplies conducted by local and regional water agencies.
Policy 3	Intergovernmental Coordination – To actively encourage opportunities for increased coordination between the County and the water agencies through cooperative water facility planning and implementation efforts.

Water Delivery System

Goal 1	To support water facility planning and development efforts for Orange County water supplies conducted by local and regional water agencies.
Policy 1	Intergovernmental Coordination – To actively encourage opportunities for increased coordination between the County and the water agencies through cooperative water facility planning and implementation efforts.

Resources Element

The Resources Element, one of nine elements of the General Plan, contains official County policies on the conservation and management of resources. The Resources Element establishes a strategy for the development, management, preservation, and conservation of resources that are necessary to meet Orange County's existing and future demands. Aspects of this Element that relate to the Project are local water availability and water quality. The Water Resources Component of the Element describes the need to manage local water resources to meet the County's needs. The following have been established in the Water Resources Component.

Goals, Objectives and Policies

Water Resources Component

The use, supply, and conservation of water are critical issues in Orange County. Since almost every urban activity is dependent on water to some extent, it is in the best interests of the general public that the County's water resources are properly planned and managed.

Goal 1	Ensure an adequate dependable supply of water of acceptable quality for all reasonable uses.
Objective 1.1	To maintain the adequacy and dependability of imported water supplies.
Objective 1.2	To achieve a reduction in per capita water consumption by the year 2020.
Objective 1.3	To reduce dependence on imported water supplies through both conservation and local water resource development.
Policy 1	Water Supply – To ensure the adequacy of water supply necessary to serve existing and future development as defined by the General Plan.
Policy 2	Conservation – To reduce per capita and total water consumption through conservation and reclamation programs and the support of new technologies.
Policy 3	Groundwater Sources – To support groundwater management efforts that are conducted by County water agencies.
Policy 4	Shortage Planning – To ensure that Orange County will not be severely impaired by any potential future water shortages.
Policy 5	Water Quality – Protect and improve water quality through continued management, enforcement, and reporting requirements. Encourage an integrated water resources approach for stormwater management that considers water supply, water quality, flood control, open space, and native habitats.

Promote coordination between the County, cities, and other stakeholders in the identification and implementation of watershed protection and Low Impact Development (LID) principles.

Consider implementation of LID principles to conserve natural features (trees, wetlands, streams, etc.), hydrology, drainage patterns, topography, and soils.

Encourage the creation, restoration, and preservation of riparian corridors, wetlands, and buffer zones. Continue to educate the public about protecting water resources.

Additional water quality policies are also provided in the Land Use Element.

Policy 6 Intergovernmental Coordination – To encourage and support a cooperative effort among all agencies towards the resolution of problems and the utilization of opportunities in the planning management and protection of water resources, including water quality.

Greenhouse Gas Emissions Impact Analysis

Climate change refers to any significant change in measures of climate (e.g., average temperature, precipitation, or wind patterns) over a period of time. Climate change may result from natural factors, natural processes, and human activities that change the composition of the atmosphere and alter the surface and features of the land. Significant changes in global climate patterns have recently been associated with global warming, which is an average increase in the temperature of the atmosphere near the Earth's surface; this is attributed to an accumulation of GHG emissions in the atmosphere. GHGs trap heat in the atmosphere which, in turn, increases the Earth's surface temperature. Some GHGs occur naturally and are emitted to the atmosphere through natural processes, while others are created and emitted solely through human activities. The emissions of GHGs through fossil fuel combustion in conjunction with other human activities are associated with global warming.

GHGs, as defined under California's Assembly Bill (AB) 32, include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). General discussions on climate change often include water vapor, atmospheric ozone, and aerosols in the GHG category. Water vapor and atmospheric ozone are not gases that are formed directly in the construction or operation of development projects, nor can they be controlled in these projects. Aerosols are not gases. While these elements have a role in climate change, they are not considered by either regulatory bodies, such as CARB, or climate change groups, such as the California Climate Action Registry, as gases to be reported or analyzed for control. Therefore, no further discussion of water vapor, atmospheric ozone, or aerosols is provided.

Thresholds of Significance

On December 5, 2008, the SCAQMD Governing Board adopted its staff proposal for an interim CEQA GHG significance threshold of 10,000 metric tons of CO_2 equivalent per year ($MTCO_2e$/year) for industrial projects where the SCAQMD is the lead agency. In September 2010, the Working Group proposed extending the 10,000 $MTCO_2e$/year screening threshold currently applicable to industrial projects where the SCAQMD is the lead agency, described above, to other lead agency industrial projects. Because the Project's land use is closest to the application of industrial uses as compared to residential and commercial uses, the significance threshold developed for industrial uses will be used for the evaluation of potential GHG impacts.

A. Methodology

Project related GHG emissions were calculated by using CalEEMod. For this analysis, the results are expressed in metric tonnes of CO2 equivalent per year ($MTCO_2e$/yr). Please see the methodology discussion in the Air Quality analysis of this report, for discussion of the CalEEMod inputs, adjustments, outputs, and other characteristics for construction-related and operational emissions.

Greenhouse Gas Emissions Analysis

The following questions correspond to the questions in the GHG Emissions section of the Initial Study Checklist in Appendix G of the State CEQA Guidelines.

Question GHG-1 Would the Project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than Significant Impact. Based on the proposed construction activities described above, the principal source of construction GHG emissions would be internal combustion engines of construction equipment, on-road construction vehicles, and workers' commuting vehicles. GHG emissions from construction activities were obtained from the CalEEMod model, described above. The estimated construction GHG emissions for the proposed Project would be 15,766 $MTCO_2e$, as shown in Table 7, Estimated Greenhouse Gas Emissions from Construction.

TABLE 7
ESTIMATED GREENHOUSE GAS EMISSIONS
FROM CONSTRUCTION

Year	Emissions ($MTCO_2e$)
2024	1,554
2025	7,754
2026	6,298
2027	160
Total	15,766
Amortized	**526**

$MTCO_2e$: metric tons of carbon dioxide equivalent

Notes:
- Totals may not add due to rounding variances.
- Detailed calculations in Attachment A.

Operational phase activities would not change substantively from existing conditions because of the lack of additional energy consumption, stationary sources and mobile vehicle trips. As such, the Project would not result in a substantial change in GHG emissions. The Project involves improvements to existing dam infrastructure and would not result in substantial increases in air pollutant sources such as vehicular or energy consumption. Existing operations related to dam inspection and maintenance activities would be comparable to that which would occur under the Proposed Project. As such, GHG emissions would likewise be essentially the same.

Because impacts from construction activities occur over a relatively short period of time, they contribute a relatively small portion of the overall lifetime Project GHG emissions. In addition, GHG emission

reduction measures for construction equipment are relatively limited. The SCAQMD recommends that construction emissions be amortized over a 30-year Project lifetime so that GHG reduction measures address construction GHG emissions as part of the operational GHG reduction strategies (SCAQMD 2008). Therefore, construction and operational emissions are combined by amortizing the construction and operations over an assumed 30-year Project lifetime. This combination is shown in Table 8, Estimated Total Project Annual Greenhouse Gas Emissions, using the proposed Project's amortized construction and operational emissions.

TABLE 8
ESTIMATED TOTAL PROJECT ANNUAL GREENHOUSE GAS EMISSIONS

Source	Emissions ($MTCO_2e/yr^a$)
Construction (Amortized)	526[a]
Operations	--
Total[b]	**526**
SCAQMD-Recommended Threshold	**10,000**
Exceeds Threshold?	**No**

$MTCO_2e/yr$: metric tons of carbon dioxide equivalent per year; SCAQMD: South Coast Air Quality Management District.

[a] Total derived by dividing construction emissions (see Table 8) by 30.
[b] Total annual emissions are the sum of amortized construction emissions and operational emissions.

It is noted that there are no established applicable quantitative federal, State, regional, or local CEQA significance criteria for GHG emissions for non-industrial projects in the SoCAB. The SCAQMD has adopted an interim threshold of 10,000 $MTCO_2e$ per year for industrial land use projects. As shown, the estimated GHG emissions from the proposed Project would be less than this suggested threshold. The impact would be less than significant, and no mitigation is required.

Question GHG-2 Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less than Significant Impact. The County of Orange has not adopted a Climate Action Plan, and the SCAQMD has not adopted standards for the purpose of reducing GHG emissions. There are a number of GHG reduction plans that have been adopted on the State and regional level. SCAG adopted this 2024–2050 RTP/SCS for the six-county region including Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties.

2022 CARB Scoping Plan

The Project would not impede the State's progress towards carbon neutrality by 2045 under the 2022 Scoping Plan. The Project would be required to comply with applicable current and future regulatory requirements promulgated through the 2022 Scoping Plan. Moreover, and as indicated above, the Project's level of GHG emissions would not exceed the SCAQMD recommended threshold of 10,000 MTCO2e/yr. Moreover, the Project would be consistent with the CAP as demonstrated above; therefore the Project would be consistent with the GHG reduction mandates established by SB 32 and the 2022 Scoping Plan. A less than significant impact would occur. Vehicle trips associated with operations of the

infrastructure are expected to be the same or comparable to existing operating conditions. The minimal amount of vehicle trips would have a negligible effect on GHG emissions. However, the Project's improvements to existing water infrastructure would meet the Project's objectives of meeting the seismic, safety and design requirements; fulfill operational requirements; extend the useful life of the dam, and improve water supply reliability. This is especially important to the challenges posed by climate change which includes increased flooding, heat events, and droughts as discussed in the California Scoping Plan. The California Scoping Plan discusses the need to enact climate change adaptation measures for water resources which includes modernization, conservation, maintaining water quality, groundwater recharge, and minimizing flood risk. Maintaining and improving water infrastructure is part of the adaptation to climate change that is necessary to prevent flooding, and to assist in the provision of adequate water supplies to the region which are goals established within the County's Resource Element of the General Plan and the California Scoping Plan.

SCAG's 2024-2050 RTP/SCS

As discussed above, the principal State plan and policy adopted for the purpose of reducing GHG emissions is AB 32. The quantitative goal of AB 32 is to reduce GHG emissions to 1990 levels by 2020. SB 375, signed in September 2008 (Chapter 728, Statutes of 2008), aligns regional transportation planning efforts, regional GHG reduction targets, and land use and housing allocations. SB 375 requires Metropolitan Planning Organizations (MPOs) to adopt a Sustainable Communities Strategy (SCS) or alternative planning strategy (APS) that will address land use allocation in that Metropolitan Planning Organization's Regional Transportation Plan (RTP). The principles of SB 375 are incorporated in SCAG's adopted 2024-2050 RTP/SCS. The proposed Project is neither a housing development project nor a transportation project that would increase population within the State or increase vehicle miles travelled (VMT). As discussed previously, the Project would also not result in substantial amounts of GHG emissions from either the construction phase or from the operations phase. As shown above, the Project would result in emissions which are below the SCAQMD's draft interim significance threshold for GHGs. As such, GHG emissions generated by the Project are not considered to be substantial. Moreover, the Project would not conflict with the goals outlined in the plan, which are to build and maintain an integrated multimodal transportation network; develop, connect and sustain communities that are livable and thriving; create a healthy region for the people of today and tomorrow; and support a sustainable, efficient and productive regional economic environment that provides opportunities for all residents. A less than significant impact would occur.

Therefore, the Project would have less than significant impacts regarding conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions, and no mitigation measures are required.

CONCLUSION

The Project was analyzed for potential air quality and GHG emissions from both the construction and operational phases. Construction emissions from the Project would exceed the SCAQMD's regional construction emissions thresholds and would result in a significant and unavoidable impact related to regional air quality despite the application of mitigation measures (**MM AQ-1**). Localized construction emissions would be less than significant due to the large distance between the Project's construction activities and the nearest sensitive land uses. Because construction emissions would exceed the SCAQMD's regional thresholds, it would also not be consistent with the goals of the AQMP and would result in a significant and unavoidable impact relative to consistency with local air quality plans.

Long-term operational emissions, and exposure of sensitive receptors to long-term criteria pollutant and TAC emissions from stationary or mobile sources would be less than significant due to the lack of additional emission sources attributable to the Project. The Project would also not exceed the growth assumptions in the AQMP and would not result in impacts related to consistent with local air quality plans for the operations phase. The proposed Project would not increase congestion or result in a significant impact related to CO hotspots.

GHG emissions for the construction and operations phases of the Project would be less than the SCAQMD-recommended threshold of 10,000 $MTCO_2e$ per year. As such, the Project would have less than significant impacts regarding generation of GHG emissions that may have a significant impact on the environment. Additionally, the Project would have less than significant impacts regarding conflict with an applicable plan, policy, or regulation adopted form the purpose of reducing the emissions of GHGs. In conclusion, the Project would have less than significant impacts for all Project-related GHG emissions.

Thank you for the opportunity to assist on this Project. If you have any questions or comments, please contact me at 714.481.8041.

Sincerely,
PSOMAS

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Santiago Creek Dam v2
Construction Start Date	9/1/2024
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	2.20
Location	Irvine Lake, California 92676, USA
County	Orange
City	Unincorporated
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5797
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.28

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
User Defined Linear	0.09	Mile	0.00	0.00	—	—	—	Irvine Lake Pipeline
General Light Industry	16.0	1000sqft	0.37	16,000	0.00	—	—	Inlet/Outlet Structure

Road Construction	0.06	Mile	0.09	0.00	—	—	—	Access Roadway
Bridge/Overpass Construction	0.03	Mile	0.06	0.00	—	—	—	Spillway Vehicle Bridge
User Defined Linear	0.25	Mile	0.40	0.00	—	—	—	MSE Wall (Dam Crest Widening)
General Light Industry	0.94	1000sqft	0.02	936	936	0.00	—	Dam Control Building
User Defined Linear	0.08	Mile	0.00	0.00	—	—	—	Emergency Outlet Pipe
User Defined Linear	0.20	Mile	2.97	0.00	—	—	—	Spillway Chute

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-5	Use Advanced Engine Tiers

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

5. Activity Data

5.1. Construction Schedule

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Part 1 Site Demolition (Excludes Spillway)	Demolition	10/1/2024	10/30/2024	5.00	22.0	—
Part 2 Site Demolition (Excludes Spillway)	Demolition	9/1/2025	9/30/2025	5.00	22.0	—
Spillway Demolition: Existing Spillway Demo	Demolition	4/1/2025	4/30/2025	5.00	22.0	—
Spillway Demolition: Crush Concrete Demo	Demolition	4/1/2025	4/30/2025	5.00	22.0	—
Spillway Demolition: Bridge Pier and Facing Demo	Demolition	4/1/2025	4/30/2025	5.00	22.0	—
Temporary Flood Control Berm	Site Preparation	10/1/2024	10/30/2024	5.00	22.0	—
Mobilization	Site Preparation	9/1/2024	10/1/2024	5.00	22.0	—
Demobilization	Site Preparation	12/1/2026	12/30/2026	5.00	22.0	—
Cleanup	Site Preparation	2/1/2027	3/2/2027	5.00	22.0	—
Allowance for Piping Install	Site Preparation	10/1/2024	10/30/2024	5.00	22.0	—
Bypass Pumping Diversion Beam	Site Preparation	9/1/2024	12/18/2024	5.00	78.0	—
Inclined Inlet Structure: Steel Pipe and Appurtenances	Building Construction	09/1/2025	12/2/2025	5.00	67.0	—
Inclined Inlet Structure: Reinforced Concrete	Building Construction	08/1/2025	10/1/2025	5.00	44.0	—
Inclined Inlet Structure: Drilled Foundation Anchors	Building Construction	8/1/2025	9/1/2025	5.00	22.0	—
Inclined Inlet Structure: Excavation	Building Construction	8/1/2025	9/1/2025	5.00	22.0	—
Inclined Inlet Structure: Stainless Steel Platform	Building Construction	10/1/2025	10/30/2025	5.00	22.0	—

Inclined Inlet Structure: Pneumatic Actuation Control System	Building Construction	10/1/2025	10/30/2025	5.00	22.0	—
Cofferdam Installation and Removal: Install Cofferdam H/King Piles	Building Construction	4/1/2025	7/1/2025	5.00	66.0	—
Cofferdam Installation and Removal: Dewatering	Building Construction	5/1/2025	7/1/2025	5.00	44.0	—
Cofferdam Installation and Removal: Remove Cofferdam H/King Piles	Building Construction	7/1/2026	7/30/2026	5.00	22.0	—
Access Road, Crest Ramp, and Existing Crest Widening: Roadway Excavation	Building Construction	10/1/2024	10/30/2024	5.00	22.0	—
Access Road, Crest Ramp, and Existing Crest Widening: Imported Fill & CMB Surface Course	Building Construction	11/1/2024	12/2/2024	5.00	22.0	—
Access Road, Crest Ramp, and Existing Crest Widening: CMB Surface Course	Building Construction	12/1/2024	12/31/2024	5.00	22.0	—
Access Road, Crest Ramp, and Existing Crest Widening: MSE Retaining Wall	Building Construction	12/1/2024	12/31/2024	5.00	22.0	—
Access Road, Crest Ramp, and Existing Crest Widening: Metal Beam Guard Rail	Building Construction	12/1/2024	12/31/2024	5.00	22.0	—
Access Road, Crest Ramp, and Existing Crest Widening: 1.5' Conc Parapet Wall	Building Construction	12/1/2024	12/31/2024	5.00	22.0	—
Dam Control Building: Pt 1 CMU Control Building	Building Construction	7/1/2026	10/1/2026	5.00	67.0	—

Dam Control Building: Pt 2 CMU Control Building	Building Construction	12/1/2026	2/2/2027	5.00	46.0	—
Dam Control Building: Reinforced Concrete Foundation	Building Construction	7/1/2026	7/30/2026	5.00	22.0	—
Dam Control Building: Metal Frame Roofing	Building Construction	12/1/2026	12/30/2026	5.00	22.0	—
Dam Control Building: Ancillary Features	Building Construction	1/1/2027	2/1/2027	5.00	22.0	—

2027	0.00	346	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.1.2. Mitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

5.18.2.2. Mitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	10.3	annual days of extreme heat
Extreme Precipitation	4.25	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	55.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	64.9
AQ-PM	64.8
AQ-DPM	18.4
Drinking Water	57.2
Lead Risk Housing	9.33
Pesticides	0.00
Toxic Releases	73.0
Traffic	95.2
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	14.3
Haz Waste Facilities/Generators	73.8
Impaired Water Bodies	23.9
Solid Waste	66.9
Sensitive Population	—
Asthma	7.91
Cardio-vascular	22.6
Low Birth Weights	12.6
Socioeconomic Factor Indicators	—
Education	27.2
Housing	54.6
Linguistic	20.6
Poverty	12.4
Unemployment	60.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	89.23392788
Employed	85.57679969
Median HI	92.4547671
Education	—
Bachelor's or higher	91.91582189
High school enrollment	17.87501604
Preschool enrollment	73.37354036
Transportation	—
Auto Access	98.98626973
Active commuting	3.349159502
Social	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	23.0
Healthy Places Index Score for Project Location (b)	89.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Data provided by applicant. Linear construction represented within vertical construction.
Construction: Off-Road Equipment	Equipment data provided by applicant.
Construction: Dust From Material Movement	Data provided by applicant - export quantities consolidated into a refined number of phases.
Construction: Trips and VMT	Monthly haul trip Data Provided by applicant; monthly haul trips accounted for in a consolidated number of phases.

EXECUTIVE SUMMARY

This report provides baseline data regarding the type and extent of biological resources for the Santiago Creek Dam Improvement Project proposed by the Irvine Ranch Water District (IRWD). The primary objective of the Project is the rehabilitation and replacement of the Santiago Creek Dam outlet tower and spillway facilities, as well as to modify the dam embankment to permit operation of the facilities for a long-term water resource benefit. The Project would also raise the spillway two feet, which would result in a small increase in maximum inundation area of the reservoir. In implementing the Project, the Districts would: (1) create new facilities and dam embankment modifications that will meet or exceed the current seismic, safety and design requirements; (2) satisfy IRWD's operational requirements in the present and future; (3) extend the useful life of the facilities; (4) improve water supply reliability; and (5) minimize impacts to local environmental resources and surrounding property owners.

The Project is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). IRWD is a participant in the NCCP/HCP. Santiago Creek Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. Santiago Creek Dam is a permitted existing use under the NCCP/HCP. No amendments to the NCCP/HCP shall be required for constructing infrastructure facilities so long as amended infrastructure plans do not result in incidental take beyond that described and permitted by the NCCP/HCP.

The following vegetation types occur in the Biological Study Area (BSA): sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore-coast live oak riparian woodland, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, and western sycamore, and vegetated fluctuating shoreline. Other landcover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas. The Project would impact coastal sage scrub, chaparral, grassland, riparian, woodland (including a limited amount of sycamore woodland), cliff, lakes, reservoirs, or basins (i.e., dewatering Irvine Lake during construction), disturbed, and developed (Table ES-1). Compensatory mitigation is included to mitigate the loss of coastal sage scrub[1], riparian, and woodland, including replacement of western sycamore (*Platanus racemosa*) and coast live oaks (*Quercus agrifolia*) that would be removed by the Project.

[1] IRWD is a participant in the NCCP/HCP and can use their take credits to compensate for the loss of coastal sage scrub.

Total		**1,016.85**	**17.50**	**264.81**	**0.14**	**282.45**	**20.04**

[a] The impact by landowner (i.e., IRWD or County of Orange) is included in Appendix N.

[b] Within the SCE Realignment, only trees and branches would be removed; other vegetation would not be temporarily removed but may be disturbed by access and movement of construction materials through the area.

Jurisdictional resources occur throughout the BSA; a summary of jurisdictional resources that would be impacted by the Project is shown in Table ES-2. A total of 203.570 acres of Waters of the U.S. under the regulatory authority of the U.S. Army Corps of Engineers (USACE) would be impacted to construct the Project (wetland: 0.000 acre permanent, 63.915 acres temporary; non-wetland: 1.798 acres permanent, 137.857 acres temporary); an additional 0.673 acre of WOTUS (0.673 acre wetland) with the additional inundation area. A total of 203.641 acres of waters of the State under the regulatory authority of the Regional Water Quality Control Board (RWQCB) would be impacted to construct the Project (wetland: 0.000 acre permanent, 63.915 acres temporary; non-wetland: 1.861 acres permanent, 137.865 acres temporary); an additional 0.711 acre of waters of the State (0.673 acre wetland, 0.038 acre non-wetland) with the additional inundation area. A total of 233.774 acres of waters under the regulatory authority of CDFW would be impacted to construct the Project (3.924 acres permanent; 229.850 acres temporary); an additional 8.980 acres of waters under the authority of CDFW with the additional inundation area. Regulatory permitting would be required prior to impacting jurisdictional resources and compensatory mitigation will be required to mitigate for the loss of these resources.

TABLE ES-2
SUMMARY OF PROJECT IMPACTS ON JURISDICTIONAL RESOURCES

	Amount of Jurisdictional Water Resource (acres)

[a] Portions of the Permanent and Temporary impact boundaries overlap the "Additional Inundation Area". This overlap is not being excluded because the Additional Inundation Area represents a long-term, periodic change in maximum lake level as opposed to a permanent structural impact or temporary construction impact.

Focused surveys for special status plants were conducted downstream of the dam in spring/summer 2020 and upstream of the dam in spring/summer 2022. Three special status plant species, intermediate mariposa lily (*Calochortus weedii* var. *intermedius*), many-stemmed dudleya (*Dudleya multicaulis*), and Coulter's matilija poppy (*Romneya coulteri*), were observed downstream of the dam during the 2020 focused surveys. Four special status

plant species, Braunton's milkvetch (*Astragalus brauntonii*), intermediate mariposa lily, mud nama (*Nama stenocarpa*), and Coulter's matilija poppy, were observed upstream of the dam during the 2022 focused surveys. The Braunton's milk-vetch, intermediate mariposa lily, the larger population of many-stemmed dudleya (810 individuals), mud nama, and Coulter's matilija poppy are all located outside the impact area for the Project. One small population of many-stemmed dudleya (10 individuals) would be impacted by the Project; this impact was determined to be less than significant since the larger population is avoided. The majority of the mud nama would be impacted by the Project's borrow areas; this impact was determined to be significant. Compensatory mitigation is included to mitigate for the loss of mud nama. Additional inundation resulting from raising the spillway is expected to be less than significant on two individual intermediate mariposa lilies.

Focused surveys for several special status wildlife were conducted in the Biological Study Area in spring/summer 2020, spring/summer 2022, summer 2024, and spring 2025. Quino checkerspot (*Euphydryas editha quino*), western spadefoot (*Spea hammondii*), arroyo toad (*Anaxyrus californicus*), southwestern [western] pond turtle (*Actinemys pallida* [*Emys marmorata*]), southwestern willow flycatcher (*Empidonax traillii extimus*), and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) were determined to be absent based on the results of focused surveys. Several special status species were observed or would be expected to occur. Those that would require additional surveys or mitigation are summarized below.

Suitable habitat is present for Crotch's bumble bee (*Bombus crotchii*) throughout the BSA; one individual was observed during focused surveys conducted in summer 2024. This species is proposed for State listing. Mitigation measures require pre-construction focused surveys for Crotch's bumble bee, avoidance of active nest burrows during construction, and consultation with California Department of Fish and Wildlife (CDFW) to obtain an Incidental Take Permit for this species.

Suitable habitat for coastal California gnatcatcher (*Polioptila californica californica*) is located throughout the BSA; one breeding territory was observed downstream of Santiago Creek Dam near the Project's impact area downstream of the dam. Suitable habitat for least Bell's vireo (*Vireo bellii pusillus*) is located along Santiago Creek, primarily at the upstream end of Irvine Lake; a total of 29 least Bell's vireo locations were observed during the 2022 focused surveys upstream of the dam. Marginally suitable habitat is located downstream of the dam along Santiago Creek; no least Bell's vireo were observed during focused surveys conducted downstream of the dam in 2020 but least Bell's vireo was incidentally observed downstream of the dam in summer 2024. The Project's staging area would be adjacent to the upstream end of Irvine Lake; noise from construction could impact breeding least Bell's vireos at the upstream end of Irvine Lake. Mitigation has been included to mitigate for the loss of coastal sage scrub and riparian habitat primarily through restoration of temporarily impacted habitat following construction, and the restoration of coastal sage scrub and riparian habitat at either an on-site or off-site mitigation site. Use of NCCP/HCP take credits would supplement the restoration and enhancement efforts as necessary. Additionally, standard NCCP/HCP construction minimization measures include pre-construction surveys, biological monitoring, and noise minimization measures to avoid and minimize impacts on these species.

A breeding pair of bald eagle (*Haliaeetus leucocephalus*), State Endangered and California Fully Protected, was incidentally observed nesting in a canyon adjacent to the BSA during focused surveys conducted around Irvine Lake in 2022. The 2022 nesting location was over 1,200 feet (approximately 0.22 mile) from the proposed borrow site/staging area, which is the closest Project activity, and approximately 1.25 miles from Santiago Creek Dam, where construction would be concentrated. Therefore, the nest would not be expected to be directly or indirectly impacted by the construction activities or noise. However, during construction, the lake would be dewatered; the temporary loss of the lake as foraging habitat may cause the bald eagles to leave Irvine Lake for the duration of construction. Avoidance and minimization measures include monitoring the bald eagles during construction if they continue to occupy the area.

Mountain lions (*Puma concolor*) are known to occur throughout the vicinity of the BSA and mountain lion sign (i.e., tracks) were incidentally observed downstream of Santiago Creek Dam during focused surveys. The mountain lion is proposed for State listing due to fragmentation of habitat that isolates populations. The Project would not create a new barrier to movement since it would occur at the existing dam. The speed limit and wildlife crossing signage would be posted along construction access roads.

Several special status bat species have potential to roost in the rocky outcroppings along Santiago Creek, in crevices of structures (e.g., dam structure, spillway, outlet tower, or dam keeper's house), or in large oak (*Quercus agrifolia*) or sycamore (*Platanus racemosa*) trees in the BSA. A pre-construction roosting bat survey (including both day and evening efforts) would be conducted prior to the initiation of construction to ensure that no active day-roosts would be impacted. If roosting bats are observed, the bats will be excluded from the areas prior to the roosts being impacted.

Best management practices to minimize impacts would be implemented to prevent the spread of invasive exotic plant species; treat invasive species during and following construction; ensure that night lighting during construction does not spillover into sensitive habitat areas; includes biological monitoring during vegetation clearing activities to ensure sensitive habitat areas are protected; and conducting a worker environmental awareness program training for all construction staff.

1.0 INTRODUCTION

This Biological Technical Report has been prepared to support California Environmental Quality Act (CEQA) documentation for the Santiago Creek Dam Improvement Project (hereinafter referred to as "the Project") proposed by Irvine Ranch Water District (IRWD). It will also support regulatory permitting with the U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and California Department of Wildlife (CDFW). This information has been reported in accordance with accepted scientific and technical standards that are consistent with the requirements of the U.S. Fish and Wildlife Service (USFWS) and the CDFW.

1.1 PROJECT LOCATION

The Project is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Existing structures include the embankment dam, outlet tower in Irvine Lake, spillway channel, flashboard storage shed, control house/outlet works, energy dissipater structure, dam keeper's house, a portion of the Irvine Lake pipeline, and dam access road (Exhibit 2).

The Project is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle map (Exhibit 3). It is within the Santa Ana Watershed. The drainage area for the Project encompasses approximately 63.4 square miles. The Project is within the Santa Ana Watershed (Hydrologic Unit Code 18070203). Irvine Lake (named Santiago Creek Reservoir by the USGS) was originally constructed in 1931 to store water for the benefit of the surrounding communities.

Irvine Lake was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west, ultimately reaching the Santa Ana River. It has a relatively broad floodplain above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the Project site in the northwest, downstream of the dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the Project site. Elevations on the Project site range from approximately 657 to 996 feet above mean sea level (msl).

Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Orange County Waste and Recycling (OCWR) Landfill Facility (i.e., Santiago Canyon Landfill) is located adjacent to the west of Irvine Lake. Residential development is located east of SR-241.

The Project is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Creek Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake (Exhibit 4). The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD)[2] is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement (IA). Santiago Creek Dam is a permitted existing use under the NCCP/HCP. No amendments to the NCCP/HCP shall be required for constructing infrastructure facilities so long as amended infrastructure plans do not result in incidental take beyond that described and permitted by the NCCP/HCP.

1.2 PROJECT BACKGROUND

IRWD owns and operates Irvine Lake and the Santiago Creek Dam that serve as a critical water supply reservoir for IRWD's service area. The Santiago Creek Dam impounds water for Irvine Lake from Santiago Creek, local storm water runoff, and raw water from Metropolitan Water District of Southern California (MWD). It serves as a domestic and non-potable water supply for various cities in Orange County.

Irvine Lake is a reservoir of untreated water located east of Irvine Regional Park. The lake's capacity is currently approximately 24,000 acre-feet (AF) but can hold an additional 2,700 AF when flash boards are installed on the spillway, temporarily raising the maximum water elevation an additional 4 feet to 795.9 feet. IRWD uses water from Irvine Lake for two purposes: 1) as a source of water for non-drinking purposes, such as irrigation uses, and 2) as a source of water for the Baker Water Treatment Plant, which produces drinking water for an estimated 85,000 homes in Orange County. IRWD can provide water from Irvine Lake to Serrano Water District (SWD) through the Howiler Treatment Plan, which is owned and operated by IRWD, to serve SWD customers in the City of Villa Park and portions of the City of Orange. Per the terms of the Water Service Reliability Agreement executed between IRWD and SWD on December 12, 2024, IRWD can backstop and/or augment use of groundwater to enhance SWD's water supply reliability using water sourced from Irvine Lake. In the future, IRWD will construct an interconnection between SWD's and IRWD's potable system, which will allow IRWD to serve water from the Howiler Treatment Plant to IRWD customers. The construction and operation of the interconnection will be subject to separate environmental review.

Santiago Creek Dam is a compacted earthfill embankment completed in 1933 and certified by the State of California, Department of Water Resources (DWR), Division of Safety of Dams (DSOD), which identifies it as Dam No. 75-000. Santiago Creek Dam is located in Orange County, California and impounds water for Irvine Lake from Santiago Creek, a tributary to the Santa Ana River. Santiago Creek Dam is approximately 136 feet high and 1,425 feet long. It is roughly 760 feet wide at the base and contains approximately 800,000 cubic yards of materials. IRWD has appropriative rights to the flows of Santiago Creek including a right to

[2] The Santiago County Water District (SCWD) was also a participating jurisdiction in the NCCP/HCP. The SCWD consolidated with IRWD in 2006.

diversion by storage in Irvine Lake for municipal, domestic, and agricultural uses. The reservoir provides flood control, water supply, fisheries enhancement, and recreational opportunities for the surrounding area. The existing silt level varies throughout the lake; however, it is estimated that the accumulated sediment currently occupies approximately 2,150 AF of the lake.

The sources of water for the Lake are flows from Santiago Creek, local runoff captured during rainfall events and untreated (imported) water purchased from MWD. The imported water is conveyed to the Lake through MWD's Santiago Lateral Pipeline (SLP). When water is drawn from the Lake from the existing outlet tower, water is conveyed via the Irvine Lake Pipeline (ILP) to downstream customers.

The outlet works for the dam consists of a tower, an outlet conduit, and a downstream control house. The outlet works are the normal means of releasing water impounded by the dam. The tower sits above the outlet pipe, or tunnel, and is used to transport water out of the reservoir. The outlet conduit conveys water from the reservoir through, under, or around a dam in a controlled manner. The downstream control house contains, or houses, electrical or other equipment. A concrete-encased welded steel pipe outlet conduit is located at the base of the outlet tower and runs beneath the dam to the toe of the dam where the pipeline splits in a bifurcation valve vault to permit water to flow into a 36-inch main pipe and a 30-inch diverter pipe. The main pipe supplies water to IRWD and the Howiler Water Treatment Plant. The diverter pipe can release water from the lake into the streambed immediately downstream of the control house for dam safety purposes.

The existing dam spillway[3] is a reinforced concrete structure located on the left abutment of the dam and consists of an approach, broad-crested weir control structure, chute, and flip bucket at the downstream end. The spillway has vertical reinforced concrete walls through the length and a bridge structure with piers at the spillway crest. The spillway crest is located at elevation 791.9 feet. Historical records of spillway flows at Santiago Creek Dam indicate that the spillway has flowed 24 times between 1937 and 2019 (82 years).

Irvine Lake is held at varying levels depending on the time of year. In the wet winter months, water can be stored up to the 791.9-foot elevational contour.[4] The height of the existing spillway with the flashboards installed is at the 795.9-foot elevation contour; this is the current maximum capacity of the reservoir and is only permitted in the summer months. Historically, the inflow into the reservoir during storm events is high enough to cause the water to flow over the spillway crest, located at the 791.9-foot elevation, approximately once every four to five years (1937 to 2019). From October 2002 to September 2020, the reservoir has been filled to the spillway crest four times and water has been high enough to flow over the spillway twice. The water levels in the lake during this period (2002 to 2020) fluctuated between the approximately 736-foot elevation contour and the 795-foot elevation contour. Between 2002 and 2020, the longest consecutive period of time that water was stored in the upper two feet of the reservoir (793.9 to 795.9 feet) was approximately 35 days.

[3] A spillway is a structure on a dam that allows water to flow around the dam to safely release excess water from a reservoir.

[4] NAVD88 Datum is used throughout this document.

1.3 PURPOSE AND NEED

In 2012, and in collaboration with DSOD, IRWD initiated seismic evaluations of the existing outlet tower that resulted in a determination that the free-standing structure was seismically unstable. In 2017, at the request of DSOD, IRWD initiated a multi-phase spillway condition assessment. The assessment found that the spillway is nearing the end of its useful life and its design, while acceptable at the time of construction, does not meet current design standards (URS 2015). IRWD has also conducted an assessment of seismic performance of the dam embankment and has determined that modifications to the Santiago Creek Dam embankment are necessary.

In view of the findings of the seismic evaluation for the existing outlet tower and dam embankment, as well as the comprehensive assessment of the existing spillway, IRWD has elected to develop designs for an inclined outlet structure that will be placed near the left abutment of the existing dam, to modify the embankment, and to replace the existing spillway with a side-channel spillway on the left abutment. The spillway crest will also be raised by six feet, which is two feet higher than the top of the flashboards when installed, to regain operational storage capacity that was lost over the years due to sedimentation. The existing outlet tower would be demolished, and the new inclined outlet structure would connect to the existing outlet conduit within the reservoir. The dam embankment would be modified to include a filter drain system.

1.4 PROJECT OBJECTIVES

The primary objective of the proposed Project is to rehabilitate and replace the Santiago Creek Dam outlet tower and spillway facilities to modify the dam embankment to permit operation of the facilities to provide a long-term water resource benefit. In implementing the proposed Project, IRWD would also obtain the following benefits:

- Construct new facilities and dam embankment modifications that will meet or exceed the current seismic, safety and design requirements established by DSOD, which is the governing state agency associated with this Project;
- Satisfy IRWD's operational requirements in the present and future;
- Extend the useful life of the facilities;
- Improve regional water supply reliability; and
- Minimize impacts to local environmental resources and surrounding property owners.

1.5 PROJECT DESCRIPTION

General elements of each portion of the Project are included below. A more detailed description of the proposed facilities is included in the Environmental Impact Report (EIR). The Project Description represents a conservative analysis to accommodate the range of uncertainty regarding the final design. Therefore, the quantities and measurements used throughout the analysis are estimates based on the best available information.

- The existing outlet tower would be demolished; with the portion of the tower located below the sediment to be filled with concrete and capped with a concrete plug or completely removed. A new inclined outlet structure would be constructed on the left abutment, including an approximately 54-inch steel pipe inclined along the slope that would act as the conveyance pipe for water into and out of the reservoir. The concrete-encased steel pipe would be situated in firm bedrock and anchored to the slope by drilled foundation anchors. A series of steel riser pipes would extend vertically from the inclined 54-inch steel pipe and would act as intakes for reservoir water into the 54-inch pipe. Each riser would include an intake fish screen that would inhibit debris, silt, and aquatic life from entering the pipe.
- The inlet/outlet works would be configured to incorporate the new structure, including new valves and fittings. Water from the lake would enter into the new inclined inlet/outlet structure and would convey lake water through an existing conduit under the dam. At the downstream toe of the dam, a new fitting would be installed to bifurcate the flow either to the ILP or the emergency outlet pipeline. Water that enters the ILP would reach IRWD's distribution system. Water that enters the emergency outlet pipeline would be released to the creek at the end of the new spillway.
- The ILP would be increased from 36 inches to 54 inches to match the pipeline coming from the inclined inlet/outlet structure, as well as to increase the capacity of the line to improve the system's hydraulics. The relocation and upsizing improvements would also protect the ILP from future flood events, thereby enhancing the overall reliability of delivering water from Irvine Lake to customers.
- The existing spillway would be demolished and replaced with a new side-channel spillway in a rock cut on the left abutment. The alignment for the new spillway was selected as a result of several constraints including the footprint of the dam embankment, the location of the sloped outlet structure, and the steeply sloped hillside along the left abutment.
- To ensure the spillway structure is constructed on sound foundational material, many areas under the spillway structure would include the placement of roller compacted concrete. In addition, the floor of the spillway would be anchored into bedrock materials that would include drilling, grouting, post-tensioning and securing the anchors into the spillway slab.
- The end of the new spillway would include a stilling basin before discharging to a concrete and riprap apron. At the end of the stilling basin, a scour protection cutoff is included for additional mitigation of head cutting that may occur during significant discharges.

- The dam embankment improvements include removing the upper portion of the dam on the downstream side of the embankment, constructing a filter drain system, and encapsulating the filter drain system with embankment shell material composed of pervious material.
- A new access road and ramp would be constructed to provide vehicle access to the new inlet/outlet structure. A new shotcrete tie-back wall would be needed to cut the roadway into the existing slope without affecting the existing landfill facility above.
- A new dam control building would be constructed to house the valve system at the end of the existing dam crest. The preliminary layout shows a fire-hardened building with the approximate dimensions of 60 feet by 20 feet with a height of 18 feet.
- The dam crest would be widened from 10 feet to between approximately 35 and 45 feet, the dam crest elevation would be raised approximately one foot, which would improve access and safety for dam maintenance. The paved dam crest would include protective railings on both sides of the road and replacement piezometers to monitor the performance of the embankment dam. These embankment improvements would require excavations along the toe of the dam to key in the earthwork improvements to the face of the dam.
- The dam crest would be raised approximately one foot on the upstream side of the dam crest. This would raise the effective dam crest from an elevation of 811.9 feet up to approximately 812.9 feet for DSOD freeboard requirements during a probable maximum flood event.
- The Project would raise the spillway six feet to 797.9 feet, which is two feet higher than the existing maximum water storage elevation of 795.5 feet. Raising the spillway would allow the dam to impound water up to the 797.9-foot elevation contour year-round, which would allow storage of approximately 1,300 AF of additional water.
- A new emergency access walkway (five feet wide) and stair system would be constructed along the left wall of the new spillway channel to reach the inlet/outlet structure and dam crest from the adjacent closed OCWR landfill facility during a spillway event. The walkway would connect to the new access road (described above).
- A new steel bridge structure would be included for vehicles across the new spillway.
- Existing structures would be demolished, including the existing vertical outlet tower and portions of 60-inch outlet conduit, significant portions (or possibly all) of the existing spillway chute and walls, spillway bridge and piers, portions of the upstream dam embankment concrete facing, storage building on the dam crest, outlet works control building and valve vault, outlet works energy dissipator vault, portions of the ILP, catwalk and stairs assembly across Santiago Creek, the dam keeper's house, boat shop (unless re-purposed for IRWD use), and piezometers/monitoring wells. Site demolition activities are anticipated to occur in 2027/2028, and spillway demolition is expected to occur in 2028. The potential removal of the boat shop building would occur at the end of the construction period in 2030. When feasible, demolished materials would be recycled or reused.

- The existing Southern California Edison (SCE) overhead power lines and power poles in the vicinity would be relocated outside the construction limits. This relocation would be completed by SCE. There would be an approximately 15-foot-wide right-of-way (ROW) easement for long-term maintenance.
- Before beginning construction of the dam improvements, the lake would be dewatered, and an access road would be graded along the edge of the dewatered lakebed to allow construction access between the staging area and the dam structure.
- IRWD would maximize withdrawals from Irvine Lake in the time leading up to construction initiation to minimize the amount required to be dewatered. The dewatering process would combine several methods including dewatering using the valves and outlet tower to allow water to flow downstream, implementing a temporary pumping system, and installing a subgrade dewatering system (e.g., dewatering wells). The temporary pumping system would include diesel-driven pumps and temporary above ground piping that would convey the water from the lake to a discharge point along Santiago Creek near the existing Arizona crossing (a type of culvert crossing). Dewatering would be used throughout the year as needed to manage the water level during and after storm events and to maintain a dry work environment. IRWD would coordinate downstream releases with impacted agencies and entities.
- Once the lake is dewatered and before the first dry season, the contractor would construct a temporary diversion berm and access ramp. The temporary diversion would provide a physical barrier to protect the work area from seasonal storms and would provide an elevated access road to allow construction equipment to access the downstream side of the dam.
- During construction, concrete crushing would occur in one of the staging areas. Concrete crushing would be expected to occur intermittently for approximately three weeks during the demolition phase of the Project but may also occur at various stages of the Project as concrete is removed from the existing spillway or dam. When feasible, demolished and removed materials would be recycled or reused.

1.6 ADDITIONAL GEOTECHNICAL INVESTIGATIONS

Although the Districts previously completed geotechnical investigation to support Project design and the development of detailed construction documents (2021–2024), additional geotechnical investigations were conducted in early 2025 to support the final design. These investigations included the performance of exploratory test pits, soil borings, packer testing, and non-intrusive geologic investigations and observations. The additional geotechnical investigations remained within the proposed limits of disturbance defined by the Project and will be mitigated as part of the overall Project. The Biological Resources Memorandums analyzing the Santiago Creek Dam Geotechnical Investigations are included in Appendix A.

1.7 CONSTRUCTION ACTIVITIES

Construction Access and Staging

The primary construction access would lead into the lake from Santiago Canyon Road and Blue Diamond Haul Road. The primary contractor staging and equipment storage area, as well as the required concrete batch plant and construction trailers, would be located in the large, flat plateau area (known as "the Flats") at the upstream end of the reservoir. The primary construction access/haul road would connect the staging area to the existing dam within the lakebed after the lake is dewatered. An earthen ramp would be constructed up the right abutment of the existing dam to allow construction vehicles to access the downstream side of the dam. To facilitate construction of the downstream features, a secondary staging area would be located on the downstream toe of the dam near the existing outlet structure building. It is anticipated that the secondary staging area would be utilized by the contractor to mobilize the roller compacted concrete batch plant. The secondary staging area may also be used to stage formwork, rebar, raw materials, and other related materials and equipment required to successfully construct the dam improvements. Material from the embankment would be removed, staged, and repurposed within the Project site.

Temporary Construction Water

Water would be utilized for various construction activities. The available water source in the Project vicinity is a 12-inch potable water line running along East Santiago Canyon Road south of Irvine Lake. IRWD would install a temporary highline from Santiago Canyon Road, along Blue Diamond Haul Road to the staging area. The temporary construction water line would be routed above-ground through the Irvine Lake parking area and along the primary contractor access/haul road to the proposed work areas. Construction activities may also use untreated water from the ILP as an additional water source.

Borrow Areas

Project construction would involve the removal and on-site transport of approximately 360,000 cubic yards (CY) of soil from on-site borrow pits, located within the limits of the lake, to serve as source material for the dam embankment. These materials would be moved from one on-site location to another and ultimately balanced on-site. The Project would include importing approximately 200,000 CY of material and exporting approximately 315,000 CY of material over the four-year construction period.

Construction Schedule

Construction work is anticipated to begin in Fall 2027 and the Project is expected to be completed within approximately four years. The approximately four-year construction window assumes down-time associated with weather restrictions and assumes working double 10-hour shifts (i.e., 20-hour workdays with nighttime work). The construction schedule assumes that a minimum of three dry seasons, which are generally between April to October, would be required to build the dam improvements in a systematic and phased fashion. It also assumes that the embankment improvements would be built concurrently with the spillway improvements. The exact date that construction begins is subject to

change. The construction schedule will be refined as Project design plans are developed and finalized.

During construction, concrete crushing would occur in the staging area at the upstream end of the lake. Concrete crushing would be expected to occur during the day from April through November during the demolition phase of the Project. As mentioned above, concrete crushing would be expected to occur intermittently for approximately three weeks during the demolition phase of the Project but may occur at various stages of the Project as concrete is removed from the existing spillway or dam.

Various public agencies (e.g., Orange County Fire Authority, Orange County Sheriff's Department, etc.) currently use portions of the proposed staging area for takeoff and landings associated with training and operational activities. During construction of the proposed Project, HeloPods[5] would be designated near the eastern edge of the lake near the Flats area at the upstream end of the reservoir for their continued use.

1.8 OPERATION AND MAINTENANCE

Once operational, all Project components would operate and be monitored through IRWD's Supervisory Control and Data Acquisition (SCADA) system. Reservoir level sensors would continue to monitor water levels in the reservoir. In addition, instrumentation and monitoring systems would continuously monitor the stability of the dam and identify situations that may require intervention, such as a controlled emergency release of water from the reservoir. Any upgrades to instrumentation and monitoring equipment would be determined during final design and may include, but are not limited to, survey monuments, inclinometers, seepage weirs, piezometers, reservoir level sensors, strong motion accelerographs, and a weather station.

Irvine Lake is generally operated in four IRWD operational modes as outlined in Table 1. Each mode has general operating parameters that allow for the safe, cost-effective operation of the lake while maximizing the potential average annual water runoff from natural storm events.

[5] Portable, tactical helicopter dip sources which provide fire crews a water source to refill the helicopters water tanks closer to the location of a wildfire.

TABLE 1
IRWD/LAKE OPERATIONAL MODES

Season	
Winter	During the Winter Mode any available rainfall is captured in the lake and stored for use. This period begins with the first rainfall event in November/December and reduces or eliminates the need to purchase untreated imported water from MWD if runoff equals or is greater than demands.
Spring	During the Spring Mode under the first option, lake storage is evaluated to determine if available runoff captured during the winter will meet demands through October 1. If additional water is needed during a dry year, untreated imported water from MWD is purchased prior to May 1. Under the second option, water is not purchased prior to the summer season.
Summer	During the Summer Mode beginning May 1, under the first option, the lake is drafted down to meet IRWD demands. Under the second option water is purchased on a month-by-month basis to meet demands, which minimizes evaporation losses applied to imported supplies.
Fall	During the Fall Mode beginning October 1, purchased untreated imported water from MWD is used to maintain the Lake at the minimum operational level while maximizing available storage. Once sufficient runoff is received to meet demands or to begin filling the lake, staff transitions to the Winter Mode.
Under some water level and rain event conditions, the spillway may be utilized to pass storm flows around the dam. When the spillway is activated, the emergency outlet valve to Santiago Creek may be opened to release water and lower the water level in the reservoir and orders for untreated imported water are ceased. Source: IRWD 2020.	

Similar to the current reservoir, operation of the proposed Project would not require daily onsite staffing but would require only periodic maintenance. Water levels at Irvine Lake would fluctuate seasonally; water would be stored in winter when water supply exceeds demand, and the reservoir would be drawn down in summer when water demand exceeds supply. However, IRWD would develop a new operating plan for Irvine Lake that would be updated each year to set targets for the volume of water to be contained in the reservoir on a daily, monthly, annual, or seasonal basis. Reservoir operations would vary with time based upon a wide variety of factors, such as: seasonal storage needs, water quality considerations, and impoundment requirements based on rainfall projections.

During precipitation events, IRWD may maintain reservoir levels well below the spillway crest to create sufficient space for stormwater runoff to enter the reservoir and avoid use of the spillway. The annual operating plan would identify an operating strategy that would reduce the potential for utilizing the spillway and for maximizing stormwater capture. Reservoir operations would be adjusted by IRWD during the year based on changes in projected demands, and other factors as needed.

Under normal operating conditions, all flow out of the reservoir would be conveyed through inlet/outlet pipeline. In the event of an emergency or for dam safety reasons, IRWD would release water through the cone valve to the creek. IRWD Operations and Maintenance staff

would continue to conduct routine safety and security checks of the site, similar to existing protocols.

1.8.1 Additional Inundation During Operation

The Project includes raising the spillway six feet to 797.9 feet, which is 2 feet higher than the existing maximum water storage elevation with the flashboards installed (759.9 feet). Raising the spillway would allow the lake to impound water up to the 797.9-foot elevation contour year-round, which would allow storage of approximately 1,300 AF of additional water. Under current operations, if Irvine Lake was full and the water was conveyed to the Baker Water Treatment Plant at full production while also feeding the Howiler Water Treatment Plant, the water level in the lake would be lowered by approximately 2 feet in approximately 18 days, assuming no additional inflow into the reservoir and excluding evaporation. IRWD estimates that the upper 2 feet of the reservoir (i.e., 795.9 to 797.9 feet in elevation) could be inundated for an approximate maximum of 30 to 45 days per year but typically would be inundated less often and in some years not at all. As previously discussed, the existing lake capacity is currently approximately 24,000 AF, but it can hold an additional 2,700 AF when the flash boards are installed on the spillway. With proposed improvements, the lake would hold a maximum of 28,000 AF.

Other than raising the spillway, all other operations would remain similar to the existing operations of the dam.

1.9 REGULATORY SETTING

1.9.1 Federal

National Environmental Policy Act

The National Environmental Policy Act (NEPA) establishes a broad national framework for protecting the environment. NEPA's basic policy is to assure that all branches of government give proper consideration to the environment prior to undertaking any major federal action that significantly affects the environment (42 *United States Code* [USC] 4321-4347). NEPA established the U.S. Environmental Protection Agency (USEPA) with the following roles and functions: (1) to establish and enforce environmental protection standards consistent with national environmental goals; (2) to conduct research on the adverse effects of pollution and on methods and equipment for controlling it; the gathering of information on pollution; and the use of this information in strengthening environmental protection programs and recommending policy changes; (3) to assist, through grants, technical assistance, and other means, in arresting pollution of the environment; and (4) to assist the Council on Environmental Quality in developing and recommending to the President new policies for the protection of the environment.

Federal Endangered Species Act

The Federal Endangered Species Act (FESA) protects plants and animals that the USFWS has listed as "Endangered" or "Threatened." A federally listed species is protected from unauthorized "take," which is defined in the FESA as acts to "harass, harm, pursue, hunt,

shoot, wound, kill, trap, capture, or collect or attempt to engage in any such conduct" (16 USC Sections 1532[19] and 1538[a]). In this definition, "harm" includes "any act which actually kills or injures fish or wildlife, and emphasizes that such acts may include significant habitat modification or degradation that significantly impairs essential behavioral patterns of fish or wildlife" (50 *Code of Federal Regulations* [CFR], Title 50, Section 17.3). Unless performed for scientific or conservation purposes with the permission of the USFWS, take of listed species is only permissible if the USFWS issues an Incidental Take Permit (ITP). When issuing an ITP, all federal agencies, including the USFWS, must ensure that their activities are "not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species" (16 USC 1536[a]). Enforcement of the FESA is administered by the USFWS.

The FESA also provides for designation of Critical Habitat: specific areas within the geographical range occupied by a species where physical or biological features "essential to the conservation of the species" are found and "which may require special management considerations or protection" (16 USC 1538[5][A]). Critical Habitat may also include areas outside the current geographical area occupied by the species that are nonetheless essential for the conservation of the species.

Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act requires consultation with the USFWS and the fish and wildlife agencies of States where the "waters of any stream or other body of water are proposed or authorized, permitted or licensed to be impounded, diverted . . . or otherwise controlled or modified" by any agency under a federal permit or license. Consultation is to be undertaken for the purpose of "preventing loss of and damage to wildlife resources."

Sections 404 and 401 of the Clean Water Act of 1972

Section 404 of the Clean Water Act (CWA) (33 USC 1251 et seq.) regulates the discharge of dredged or fill material into waters of the United States (WOTUS), including wetlands. The USACE is the designated regulatory agency responsible for administering the 404 permit program and for making jurisdictional determinations. This permitting authority applies to all waters of the United States where the material has the effect of (1) replacing any portion of WOTUS with dry land or (2) changing the bottom elevation of any portion of WOTUS. These fill materials would include sand, rock, clay, construction debris, wood chips, and materials used to create any structure or infrastructure in WOTUS. Dredge and fill activities are typically associated with development projects; water resource-related projects; infrastructure development; and wetland conversion to farming, forestry, or urban development.

The definition of WOTUS has been the subject of shifting regulations. Past federal revisions to regulations addressing the extent of USACE jurisdiction and the definition of WOTUS have been issued by the Obama Administration in 2015 and the Trump Administration in 2020. On January 18, 2023, the United States Environmental Protection Agency (USEPA) published a final Water Rule in the Federal Register that went into effect on March 20, 2023 ("the 2023 Rule") (USACE and USEPA 2023a).

The definition of WOTUS changed again in response to the Supreme Court decision in the case of *Sackett v. USEPA*[6]. On September 8, 2023, the USEPA and the USACE amended the Code of Federal Regulations to conform the definition of WOTUS to the Supreme Court decision (USACE and USEPA 2023b). This conforming rule amends the provisions of the agencies' definition of WOTUS that were invalid under the Supreme Court's interpretation of the CWA under *Sackett*. Based on these changes, tributaries must have at least relatively permanent flow to be considered WOTUS from the federal definition. This would exclude ephemeral drainages from being WOTUS. This represents a substantial change to areas under federal jurisdiction in the arid west. This report provides interpretations of WOTUS under the Amended 2023 Rule.

Under Section 401 of the CWA, an activity requiring a USACE Section 404 permit must obtain a State Water Quality Certification (or waiver thereof) to ensure that the activity will not violate established federal or State water quality standards. The State Water Resources Control Board (SWRCB), in conjunction with the nine California RWQCBs, is responsible for administering the Section 401 water quality certification program. The SWRCB's and RWQCB's jurisdiction also extend to all "waters of the State" when no WOTUS are present, including wetlands and non-wetland waters of the State (isolated and non-isolated). The USEPA is the federal regulatory agency responsible for implementing the CWA.

Migratory Bird Treaty Act of 1918

The Migratory Bird Treaty Act (MBTA) of 1918 (16 USC 703–711), as amended in 1972, makes it unlawful at any time, by any means or in any manner, unless permitted by regulations, to "pursue; hunt; take; capture; kill; attempt to take, capture, or kill; possess; offer for sale; sell; offer to barter; barter; offer to purchase; purchase; deliver for shipment; ship; export; import; cause to be shipped, exported or imported; deliver for transportation; transport or cause to be transported; carry or cause to be carried; or receive for shipment, transportation, carriage, or export, any migratory bird; any part, nest, or eggs of any such bird; or any product, whether or not manufactured, which consists, or is composed in whole or part, of any such bird or any part, nest, or egg thereof. . . ." (16 USC 703).

The MBTA covers the taking of any nests or eggs of migratory birds, except as allowed by permit pursuant to 50 CFR, Part 21. This regulation seeks to protect migratory birds and active nests. The MBTA protects over 800 species, including geese, ducks, shorebirds, raptors, songbirds, and many relatively common species. Bird species protected under the provisions of the MBTA are identified by the List of Migratory Birds (50 CFR 10.13), as updated by the 1983 American Ornithologists' Union (AOU) Checklist and published supplements by the USFWS.

In 1972, the MBTA was amended to include protection for migratory birds of prey (e.g., raptors). Six families of raptors occurring in North America were included in the amendment: Accipitridae (kites, hawks, and eagles); Cathartidae (New World vultures); Falconidae (falcons and caracaras); Pandionidae (ospreys); Strigidae (typical owls); and

[6] Further discussion of this court decision is included in Appendix A of the Jurisdictional Delineation.

Tytonidae (barn owls). The provisions of the 1972 amendment to the MBTA protect all species and subspecies of these families.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (16 USC 668) provides for the protection of the bald eagle (*Haliaeetus leucocephalus*) and the golden eagle (*Aquila chrysaetos*) by prohibiting, except under certain specified conditions, the taking, possession, and commerce of such birds. The 1972 amendments increased penalties for violating provisions of the Act and strengthened other enforcement measures. A 1978 amendment authorized the Secretary of the Interior to permit the taking of golden eagle nests that interfere with resource development or recovery operations.

The Bald and Golden Eagle Protection Act defines "take" as "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb." Regulations further define "disturb" as "to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, 1) injury to an eagle, 2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or 3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior" (50 CFR 22.6).

In addition to immediate impacts, this definition also covers effects that result from human-induced alterations initiated around a previously used nest site during a time when eagles are not present, if, upon the eagle's return, such alterations agitate or bother an eagle to a degree that interferes with or interrupts normal breeding, feeding, or sheltering habits, and causes injury, death or nest abandonment.

A 1994 Memorandum from President William Clinton to the heads of Executive Agencies and Departments established the policy concerning collection and distribution of eagle feathers for Native American religious purposes.

1.9.2 State

California Environmental Quality Act

CEQA (13 *Public Resources Code* Sections 21000 et seq.) is a statute that requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. The CEQA Guidelines (14 *California Code of Regulations* [CCR] Chapter 3) are the regulations that explain and interpret the law for both public agencies and private development required to administer CEQA.

With regards to plants and animals, CEQA Guidelines Section 15380 independently defines "Endangered" and "Rare" species separately from the definitions of the California Endangered Species Act (CESA). Under CEQA, Endangered species of plants or animals are defined as those whose survival and reproduction in the wild are in immediate jeopardy, while Rare species are defined as those that (1) have such low numbers that they could become Endangered if their environment worsens or (2) are likely to become endangered within the foreseeable future (i.e., "threatened" as used in the FESA). In addition, a Lead

Agency can consider a non-listed species (e.g., species with a California Rare Plant Rank [CRPR], California Species of Special Concern, or species of Local Concern) to be treated as if it were Endangered, Rare, or Threatened for the purposes of CEQA if the species can be shown to meet the criteria in the definition of "Rare" or "Endangered" in the Project region.

The CEQA Guidelines designate certain "trustee agencies" that have jurisdiction by law over natural resources affected by a project which are held in trust for the people of California. CDFW is the trustee responsible for conservation, protection, and management of wildlife, native plants, and habitat necessary to maintain biologically sustainable populations. Trustee agencies are generally required to be notified of CEQA documents relevant to their jurisdiction, whether or not these agencies have actual permitting authority or approval power over aspects of the underlying project. CDFW shall provide the requisite biological expertise to review and comment upon environmental documents and impacts arising from project activities and shall make recommendations regarding those resources held in trust for the people of California (*California Fish and Game Code* §1802).

California Endangered Species Act

The State of California implements the CESA, which is enforced by the CDFW. While the provisions of the CESA are similar to the FESA, CDFW maintains a list of California Threatened and Endangered species, independent of the FESA Threatened and Endangered species list. It also lists species that are considered Rare and Candidates for listing, which also receive protection. The California list of Endangered and Threatened species is contained in Title 14, Sections 670.2 (plants) and 670.5 (animals) of the *California Code of Regulations*.

State-listed Threatened and Endangered species are protected under provisions of CESA. Activities that may result in take of individuals (defined in CESA as acts to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") are regulated by CDFW. While habitat degradation or modification is not included in the definition of "take" under CESA, the CDFW has interpreted "take" to include the destruction of nesting, denning, or foraging habitat necessary to maintain a viable breeding population of protected species.

If it is determined that the "take" would not jeopardize the continued existence of the species, an ITP can be issued by CDFW per Section 2081 of the *California Code of Regulations*. If a State-listed species is also federally listed, and the USFWS has issued an ITP that satisfies CDFW's requirements, CDFW may issue a consistency finding in accordance with Section 2080.1 of the *California Fish and Game Code*.

California Fish and Game Code

CDFW administers the *California Fish and Game Code*. Particular sections of the Code are applicable to natural resource management.

Native Plant Protection

Sections 1900–1913 of the *California Fish and Game Code* were developed to preserve, protect, and enhance Endangered and Rare plants in the State of California. The act requires

all State agencies to use their authority to carry out programs to conserve Endangered and Rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of the CDFW at least ten days in advance of any change in land use that would adversely impact listed plants. This allows the CDFW to salvage listed plant species that would otherwise be destroyed.

Unlawful Take or Destruction of Nests or Eggs

These sections duplicate federal protection under the MBTA. Section 3503 of the *California Fish and Game Code* makes it unlawful to take, possess, or destroy any bird's nest or any bird's eggs. Further, any birds in the orders *Falconiformes* or *Strigiformes* (i.e., birds of prey, such as hawks, eagles, and owls) and their nests and eggs are protected under Section 3503.5 of the *California Fish and Game Code*. Section 3513 of the *California Fish and Game Code* prohibits the take and possession of any migratory nongame bird, as designated in the MBTA.

California Fully Protected Species

The State of California created the "Fully Protected" classification in an effort to identify and provide additional protection to those animals that are rare or that face possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under the State and/or Federal Endangered Species Acts; however, some have not been formally listed.

Various sections of the *California Fish and Game Code* provide lists of Fully Protected reptile and amphibian (§ 5050), bird (§ 3511), and mammal (§ 4700) species that may not be taken or possessed at any time, except as provided in Sections 2081.7, 2081.9, or 2835. CDFW is unable to authorize the issuance of permits or licenses to take these species, except for necessary scientific research.

Natural Communities Conservation Planning Act

The Natural Community Conservation Planning Act, codified in Sections 2800–2835 of the *California Fish and Game Code* and signed into law in October 1991, authorizes the preparation of Natural Community Conservation Plans (NCCPs). The Act is a State of California effort to protect critical vegetative communities and their dependent wildlife species. The purpose of an NCCP is to sustain and restore those species and their habitat identified by CDFW that are necessary to maintain the continued viability of those biological communities impacted by human changes to the landscape. The NCCP process provides an alternative to protecting species on a "single species basis" as in the federal and State ESAs. Under the Act, CDFW is responsible for creating process planning and conservation guidelines for NCCP programs. Local governments and landowners may then prepare the NCCPs so that they comply with the CESA.

California Fish and Game Code (Sections 1600 through 1616)

California Fish and Game Code Sections 1600 et seq. establish a process to ensure that projects conducted in and around lakes, rivers, or streams do not adversely impact fish and wildlife resources or, when adverse impacts cannot be avoided, ensures that adequate mitigation and/or compensation is provided.

California Fish and Game Code Section 1602 requires any person, State, or local governmental agency or public utility to notify CDFW before beginning any activity that will do one or more of the following:

- substantially obstruct or divert the natural flow of a river, stream, or lake;
- substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake.

Section 1602 of the *California Fish and Game Code* applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State. CDFW's regulatory authority extends to include riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, CDFW takes jurisdiction to the top bank of the stream or to the outer limit of the adjacent riparian vegetation (outer drip line), whichever is greater. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation. A Section 1602 Lake or Streambed Alteration Agreement would be required if impacts to identified CDFW jurisdictional areas occur.

California Porter-Cologne Water Quality Control Act

The Porter-Cologne Act broadly defines "waters of the State" as any surface water or groundwater, including saline waters, within the boundaries of the State." In 2020, the Office of Administrative Law (OAL) began implementing the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to waters of the State. Under these new regulations, the SWRCB and its nine RWQCBs assert jurisdiction over all existing WOTUS, and all waters that would have been considered WOTUS under any historical definition.

Impacts to WOTUS are authorized by the RWQCBs through a Water Quality Certification per Section 401 of the CWA. Impacts to "waters of the State" that are not considered WOTUS would be authorized by Waste Discharge Requirements (WDRs) issued by the RWQCB, pursuant to California's Porter-Cologne Water Quality Control Act.

Pursuant to the California Porter-Cologne Water Quality Control Act, the SWRCB and the nine RWQCBs may require permits (known as "Waste Discharge Requirements" or WDRs) for the fill or alteration of the waters of the State. The term "waters of the State" is defined as "any

surface water or groundwater, including saline waters, within the boundaries of the state" (*California Water Code,* Section 13050[e]). The SWRCB and RWQCB have interpreted their authority to require WDRs to extend to any proposal to fill or alter waters of the State, even if those same waters are not under USACE jurisdiction. Pursuant to this authority, the State and Regional Boards may require the submission of a "report of waste discharge" under Section 13260, which is treated as an application for WDRs.

The Porter-Cologne Water Quality Control Act charges the SWRCB and the nine RWQCBs statewide with protecting water quality throughout California. Typically, the SWRCB and RWQCB act in concert with the USACE under Section 401 of the CWA in relation to permitting fill of federally jurisdictional waters. SWRCB and the RWQCBs may require permits (i.e., WDRs) for the fill or alteration of the waters of the State.

1.9.3 Regional

Central-Coastal Natural Community Conservation Plan/Habitat Conservation Plan

On August 30, 1991, the State Fish and Game Commission considered a petition in support of listing the coastal California gnatcatcher (*Polioptila californica californica*). The Commission decided not to list the coastal California gnatcatcher as an Endangered species in favor of pursuing preparation of a NCCP program as proposed by Assembly Bill (AB) 2172 (AB 2172/Natural Community Conservation Planning Act). AB 2172 authorized CDFW[7] to enter into agreements with any person for the purpose of preparing and implementing NCCPs and to prepare guidelines for development and implementation of NCCPs. AB 2172 also permits NCCPs to be prepared by local, State, or federal agencies independently or in cooperation with other persons and requires CDFW to be compensated for costs incurred in preparing and implementing NCCPs.

The purpose of the NCCP program is to provide regional or area wide protection and perpetuation of natural wildlife diversity while allowing compatible and appropriate development and growth. AB 2172 was designed in recognition of the fact that individual species protection under the state Endangered Species Act and the federal Endangered Species Act (FESA) is costly and historically ineffective as a mechanism for protection or prevention of extinction of plant and wildlife species, and that a habitat-based, multispecies or ecosystem-driven preservation approach has greater potential for long-term success. The focus of the NCCP program represents a dramatic shift from "individual species" to "habitat".

On March 25, 1993, the U.S. Department of the Interior listed the coastal California gnatcatcher as a "Threatened" species and adopted a special rule in accordance with Section 4(d) of the FESA that authorized landowners and local jurisdictions to voluntarily participate in the State of California NCCP Act of 1992.

The County of Orange, in conjunction with the state and federal resource agencies, local jurisdictions, utility companies (including IRWD), the Transportation Corridor Agencies, and major private landowners, prepared the NCCP/HCP for the Central–Coastal NCCP Subregion

[7] The California Department of Fish and Wildlife (CDFW) was formerly known as the California Department of Fish and Game (CDFG).

(NCCP/HCP approved on April 16, 1996, and Implementation Agreement [IA] executed on July 17, 1996). The plan is intended to ensure the long-term survival of the coastal California gnatcatcher and other special status coastal sage scrub-dependent plant and wildlife species while allowing for reasonable economic growth in accordance with state-sanctioned NCCP program guidelines. The Project occurs within the NCCP Central/Coastal Subregion.

The Habitat Reserve includes core habitat along the frontal slopes of the Lomas de Santiago and provides high densities of NCCP target species, including coastal California gnatcatcher and coastal cactus wren (*Campylorhynchus brunneicapillus couesi*). In addition, the Habitat Reserve provides linkages with other core habitat areas via a long strip of natural habitat between Portola Parkway and the Foothill Transportation Corridor, and other large blocks of core habitat in the vicinity of the frontal slopes of the Lomas de Santiago, including Syphon Reservoir and Rattlesnake Reservoir. The Habitat Reserve supports the largest subpopulation of coastal California gnatcatchers in the Central Subarea of the NCCP Central/Coastal Subregion Reserve System Design for Orange County (County of Orange 1996a).

The County of Orange has been issued a 10(a) permit as part of the approval of the NCCP/HCP which authorizes the "take" of coastal sage scrub and other specified habitats (e.g., oak woodland, cliff and rock, Tecate cypress) and provides regulatory coverage for a number of "Covered Species". Potential direct and indirect impacts are fully mitigated through the County's participation and contribution in the NCCP/HCP Mitigation Program. The participation not only provides mitigation for coastal sage scrub and the coastal California gnatcatcher, but also other special status species designated as Covered Species by the NCCP/HCP. Mitigation measures outlined in the NCCP/HCP Mitigation Program are summarized below:

1. *Creation of a Habitat Reserve System that will include coastal sage scrub and representative habitat of virtually all of the major habitat types currently existing within the Central/Coastal Subregion;*
2. *Creation and funding of an NCCP Non-Profit Corporation to coordinate management of the Reserve System;*
3. *Designation of Special Linkage Areas and Existing Use Areas to enhance biological connectivity within the Reserve System and Central/Coastal Subregion;*
4. *Implementation of the Adaptive Management Program, including specific management plans, defined by the NCCP/HCP, within the Reserve System, including provisions for restoration and enhancement funded both by Participating Landowners and Non-Participating Landowners as provided herein.*

2.0 METHODS

This section summarizes survey methods used to conduct biological surveys for the Project. The Biological Study Area (BSA) discussed in this report generally includes the area around Santiago Creek Dam and Irvine Lake. Initial work (spring/summer 2020) was focused north (downstream) of the dam structure in a Project study area provided by IRWD. The BSA was expanded in fall 2020 to south (upstream) of the dam, including the entirety of Irvine Lake, in order to assess potential effects related to raising the spillway and additional staging/access areas in Oak Park. The BSA was developed by adding a 250-foot buffer around the 797.9-foot elevation contour. Where the buffer did not include the 811.9-foot contour, the BSA was extended 50-feet beyond the 811.9-foot contour.[8] However, the BSA was truncated at the ridgeline adjacent to Irvine Lake and at Santiago Canyon Road because indirect effects (e.g., noise) would not be expected to extend over the ridgeline. This BSA allows for an assessment of indirect impacts of inundation effects and construction activities on surrounding habitat (Exhibit 3).

The focused surveys that Psomas conducted in spring/summer 2020 were limited to the area downstream of the dam, while the focused surveys conducted in spring/summer 2022 were generally conducted upstream of the dam. The survey area for each species varied depending on target habitat and details of each species protocol. Vegetation mapping and the jurisdictional delineation were conducted throughout the BSA. It should be noted that when the term "survey area" is used, it does not refer to the entire BSA.

2.1 LITERATURE REVIEW

Prior to the start of surveys, Psomas conducted a literature search to identify special status plants, wildlife, and habitats reported from the vicinity of the BSA. The literature review was updated prior to the 2022 focused surveys and again as documentation was completed; the most recent citation is given below. The BSA region is generally defined as the Central Subregion of the NCCP/HCP. Psomas reviewed the following sources of information:

- CDFW's California Natural Diversity Database (CNDDB) (CDFW 2025a)
- The California Native Plant Society's (CNPS') Inventory of Rare and Endangered Plants (CNPS 2025)
- CDFW's *Natural Communities List* (CDFW 2025b), *Special Vascular Plants, Bryophytes, and Lichens List* (CDFW 2025c), and *Special Animals* List (CDFW 2025d)
- Jepson eFlora (Jepson Flora Project 2024)
- County of Orange *Natural Community Conservation Plan and Habitat Conservation Plan* (County of Orange 1996a) and *Implementation Agreement* (County of Orange 1996b)

[8] The study area extended to the elevation of the dam crest (811.9 feet) because the impact boundary had not yet been developed when the surveys began.

- USFWS Information for Planning and Consultation (IPAC) Database (USFWS 2025, Appendix B)

2.2 VEGETATION MAPPING AND GENERAL SURVEYS

Psomas Senior Biologist Allison Rudalevige performed a general survey and vegetation mapping north (downstream) of the dam on February 25, 2020. Ms. Rudalevige and Psomas Senior Biologist Lindsay Messett performed a general survey and vegetation mapping south (upstream) of the dam on September 16 and 17, 2020. Psomas mapped vegetation in the field on an aerial photograph at a scale of 1-inch equals 175-feet (1″=175′) downstream of the dam and 1-inch equals 275 feet (1″ = 275′) upstream of the dam. Psomas used a boat for navigable access in order to map the vegetation along the northern portion of Irvine Lake. Psomas mapped vegetation along the southern portion of Irvine Lake and upstream into Santiago Creek on foot. Psomas used binoculars to map vegetation that was inaccessible due to steep topography or due to access issues.

Nomenclature of vegetation types generally follows Gray and Bramlet (1992) but is cross-referenced to *A Manual of California Vegetation* (CNPS 2024), which is the most current vegetation classification system used by CDFW for assessing sensitive natural communities (CDFW 2025b). Nomenclature of plant taxa conform to the *Special Vascular Plants, Bryophytes, and Lichens List* (CDFW 2025c) for special status species and the Jepson eFlora (Jepson Flora Project 2024) for all other taxa. Representative photographs of the BSA are included in Appendix C.

Psomas biologists documented all plant and wildlife species detected during the survey in field notes and they are listed in Appendix D. Psomas conducted active searches for reptiles and amphibians that included lifting, overturning, and carefully replacing rocks and debris. Psomas identified birds by visual and auditory recognition. Psomas conducted surveys for mammals during the day and included searching for and identifying diagnostic signs, including scat, footprints, scratch-outs, dust bowls, burrows, and trails. Taxonomy and nomenclature for wildlife follows the *Special Animals List* (CDFW 2025d) for special status species and, for other species, Crother (2017) for amphibians and reptiles, the American Ornithological Society (AOS 2024) for birds, and the Smithsonian National Museum of Natural History (SNMNH 2011) for mammals.

2.3 FOCUSED SURVEYS

2.3.1 Special Status Plant Species

Psomas conducted the botanical surveys consistent with the protocols created by CDFW (2018); therefore, the surveys were floristic in nature. Psomas conducted a literature search prior to both the 2020 and 2022 field surveys to identify special status plant species reported from the vicinity of the BSA. The literature search was updated as technical documentation was updated. Sources reviewed include the USGS's Black Star Canyon, Orange, Tustin, and El Toro 7.5-minute quadrangles in the California Native Plant Society's Inventory of Rare and Endangered Plants (CNPS 2025) and CDFW's CNDDB (CDFW 2025a).

Many annual and perennial herb species' germination capability are dependent on receiving a certain amount of rainfall in the winter and spring. The region received approximately 17.7 inches of precipitation between August 2019 and July 2020 (data taken from Irvine – South Coast Valleys Station No. 75) (CIMIS 2020). The region received approximately 9.3 inches of precipitation between July 2021 and June 2022 (data taken from Irvine – South Coast Valleys Station No. 75) (CIMIS 2022). The average annual precipitation for this area is between 10 and 13 inches. Therefore, rainfall was considered within normal ranges and conditions should have been adequate for germination of most plant species.

Additionally, reference populations were monitored for annual and difficult-to-detect target species to ensure that the surveys were comprehensive (Table 2). This is especially relevant during periods of unusual rainfall patterns or below average rainfall. If conditions at a nearby reference population are suitable for germination and growth, then it can be inferred that conditions would also be suitable in the BSA. Reference populations were not monitored for species with a CRPR of 3 or 4, large perennials (e.g., Tecate cypress [*Hesperocyparis forbesii*] and chaparral nolina [*Nolina cismontana*]), which would be identifiable throughout the year, or for species lacking a publicly accessible reference population.

TABLE 2
REFERENCE POPULATIONS MONITORED IN THE PROJECT REGION

Species	Date Observed	Location	Phenology
Brodiaea filifolia thread-leaved brodiaea	May 15, 2020	San Clemente	in bloom
Calochortus weedii var. *intermedius* intermediate mariposa lily	June 1, 2020 May 12, 2022	Peters Canyon Regional Park Santiago Canyon vicinity	in bloom early bloom
Dudleya multicaulis many-stemmed dudleya	April 12, 2017 April 27, 2022	City of Orange Santiago Canyon vicinity	Vegetative in bloom
Pseudognaphalium leucocephalum white rabbit-tobacco	September 8, 2022	San Juan Capistrano	in bloom

Surveys downstream of the dam were conducted on April 30, May 21, and June 4, 2020, by Psomas Senior Biologist Allison Rudalevige. The total number of person-hours spent surveying was approximately 15.75 hours. The 2020 plant survey area included the portion of the BSA located downstream of the dam. A systematic survey was conducted in all areas of suitable special status plant habitat in the survey area.

Surveys upstream of the dam were conducted on March 24, 2022, by Ms. Rudalevige; on April 25, 26, and 28, 2022, by Ms. Rudalevige and Consulting Botanist Sandra Leatherman; on May 23 and 26 by Ms. Rudalevige and Psomas Biologist Erin Ruckman; and on September 13, 2022, by Ms. Rudalevige and Psomas Biologist Sarah Thomas. The total number of person-hours spent surveying was approximately 87.75 hours. The special status plant survey area included all project impact areas upstream, of the dam (i.e., permanent, temporary, and additional inundation areas) plus a 50-foot buffer. A systematic survey was conducted in all areas of suitable special status plant habitat in the survey area. Inaccessible areas (e.g., steep cliffs), were observed remotely with binoculars.

All plant species observed were recorded in field notes. Plant species were identified in the field or collected for future identification. Plants were identified to the taxonomic level necessary to determine whether they were a special status species. Plants were identified using taxonomic keys, descriptions, and illustrations in Jepson Flora Project (2024), Baldwin et al. (2012), Hickman (1993), and Munz (1974). Nomenclature of plant taxa conform to the *Special Vascular Plants, Bryophytes, and Lichens List* (CDFW 2025c) for special status species and the Jepson eFlora (Jepson Flora Project 2024) for all other taxa.

Any special status plant species observed in the survey area were mapped on an iPad loaded with Avenza Maps software or with a handheld Garmin Global Positioning System (GPS) unit. Data were collected on the number and phenology of individuals (estimated for large populations) and microsite characteristics (e.g., slope, aspect, soil texture, surrounding habitat, and associated species). The results of the special status plant survey efforts are included as Appendix E.

2.3.2 Quino Checkerspot Butterfly

Psomas conducted Quino checkerspot butterfly surveys following guidelines from the USFWS Survey Protocol (USFWS 2014) to maximize detection of adults during the flight season. Per the USFWS protocol, surveys consist of an initial site assessment to determine if the Project site contains areas recommended for Quino checkerspot butterfly surveys. If the Project site is determined to be comprised solely of excluded areas (described below), Quino checkerspot butterfly surveys are not recommended. If a Project site has areas suitable for butterfly surveys (non-excluded areas), then surveys should be conducted in those portions of the Project site. Per USFWS protocol, Psomas completed five weekly focused surveys beginning the third week of February and continuing into March.

All areas within 50-feet of the proposed impact footprint (including additional inundation areas) were included in the site assessment. The site assessment was conducted prior to the first focused butterfly survey to identify which portions of the Project site provide suitable habitat for Quino checkerspot butterfly. The assessment was conducted by Psomas Senior Biologist Lindsay Messett (USFWS Permit No. TE 067064-5) on February 15 and 16, 2022.

Per the USFWS protocol, orchards, developed areas, or small in-fill parcels (plots smaller than one acre that are completely surrounded by urban development) largely dominated by non-native vegetation, active/in-use agricultural fields, closed-canopy forests or riparian areas, dense chaparral, and small openings (less than one acre) completely enclosed within dense chaparral, were considered unsuitable and designated as “excluded areas”. Areas outside of excluded areas, regardless of the presence/absence of host plants and nectar sources, were considered potential habitat areas.

All areas that were not excluded were surveyed for Quino checkerspot butterfly, regardless of host plant presence, absence, and/or density. The Quino checkerspot butterfly is generally associated with sage scrub, open chaparral, grasslands, and vernal pools. Within these communities, they are usually observed in open or sparsely vegetated areas (including trails and dirt roads), on hilltops, and on ridgelines.

The survey area contained approximately 308 acres of suitable habitats that could not be excluded per USFWS protocol; two days were required to complete each survey visit. The survey visits were divided into two areas (i.e., upstream of Santiago Creek Dam and downstream of Santiago Creek Dam). Ms. Messett conducted five rounds of focused survey visits in the survey areas during the 2022 flight season. Surveys were conducted once per week (weather permitting) on non-consecutive days during the peak of the flight season on February 18, 19, 25, 27; March 3, 4, 10, 11, 17, and 18, 2022. Table 3 below summarizes the survey conditions during each of the ten surveys.

TABLE 3
SUMMARY OF QUINO CHECKERSPOT BUTTERFLY SURVEYS

Survey Number	Survey Location	Date	Time (Start/End)	Surveyor	Weather Conditions		
					Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)
1	Downstream of Santiago Creek Dam	February 18, 2022	0900/1500	Messett	62/70	0–1/2–5	Clear/Clear
1	Upstream of Santiago Creek Dam	February 19, 2022	0930/1530	Messett	60/70	0–1/4–6	25/20
2	Downstream of Santiago Creek Dam	February 25, 2022	1000/1600	Messett	60/63	2–3/5–7	Clear/Clear
2	Upstream of Santiago Creek Dam	February 27, 2022	1000/1545	Messett	61/70	0–1/5–6	10/10
3	Upstream of Santiago Creek Dam	March 3, 2022	0930/1555	Messett	62/67	1–2/8–10	50/30
3	Downstream of Santiago Creek Dam	March 4, 2022	0915/1530	Messett	63/65	0–1/2–5	50/50
4	Upstream of Santiago Creek Dam	March 10, 2022	0845/1550	Messett	63/71	2–3/4–6	30/Clear
4	Downstream of Santiago Creek Dam	March 11, 2022	0815/1530	Messett	68/74	3–4/6–8	Clear/Clear
5	Upstream of Santiago Creek Dam	March 17, 2022	0930/1600	Messett	65/80	0–1/2–5	25/30
5	Downstream of Santiago Creek Dam	March 18, 2022	0900/1515	Messett	68/74	1–2/4–6	Clear/Clear

Surveys focused on likely breeding areas (host plant patches), feeding areas (nectaring plant patches), and topographical features conducive to detecting the Quino checkerspot butterfly

(ridgelines, hilltops, rock outcrops, dirt roads, and open ground with clay soils). Survey areas were walked at an average rate of 10 to 15 acres per hour. Binoculars were used to identify the majority of butterfly species that could not be seen at close range. General survey forms were filled out for each survey, noting weather conditions, survey date, start and end times, and nectaring sources in bloom.

The results of the Quino checkerspot surveys are included in Appendix F.

2.3.3 Crotch's Bumble Bee

In June 2023, the California Department of Fish and Wildlife (CDFW) issued survey guidelines for Candidate bumble bee species recommending at least three visual surveys conducted two to four weeks apart during the appropriate Colony Active Period (April to August for Crotch's bumble bee) to ensure the highest probability of detecting the species (CDFW 2023). Surveys must be conducted at a rate of three acres per hour within optimal habitat by a qualified Biologist (i.e., one with appropriate permits and experience in the identification of bee species). Psomas Senior Biologist Lindsay Messett (Scientific Collecting Permit [SCP]; 182810004-20009-001[9]) conducted all focused surveys for Crotch's bumble bee. The survey included all suitable foraging and potential nesting habitats for the Crotch's bumble bee in the survey area. Surveys were conducted on June 20 and 21; July 16 and 17; and August 5 and 6, 2024. A summary of weather conditions during each survey is provided in Table 4.

Ms. Messett conducted the surveys by walking meandering transects, slowly across the survey area, through all appropriate habitats, to obtain a 100 percent survey cover. The surveys were paced at approximately three acres per hour in optimal habitats but were more quickly paced in areas lacking available nectar sources. Ms. Messett scanned for bee activity on the ground and spent additional time at any flowering plants to look for foraging bees. Potential nest sites (e.g., forest edges, unmowed areas, and cavities such as mammal burrows) were inspected with binoculars for evidence of bumble bee use. If multiple exiting/entering bumble bees were observed at a cavity, further observation was made until nesting could be confirmed (e.g., multiple individuals entering the cavity).

Surveys were non-lethal (capture, photograph, release) and were conducted in accordance with the CDFW Survey Considerations for California Endangered Species Act Candidate Bumble Bee Species (CDFW 2023) and authorizations in Ms. Messett's SCP and MOU issued by CDFW. All bumble bees observed were captured using a butterfly net. Bees were carefully transferred to a clear, plastic vial and placed in a cooler with ice to chill. Once the bees were cooled, they were removed from the vial and photographed. Photographs focused on specific identifiable areas of the bees (i.e. the top of the abdomen, side of the thorax and abdomen, and the front and side views of the head). The bees were processed within 15 minutes of capture and were released within 100 feet of the capture site. Bumble bee species were identified by Ms. Messett using *Bumble Bees of North America: An Identification Guide* (Williams *et al.* 2014). Photographs of the bumble bees observed during the surveys were

[9] Lindsay Messett's SCP includes a MOU to allow her to capture and handle Crotch's bumble bee according to the survey guidelines.

also provided to taxonomist Dr. Keng-Lou James Hung, PhD (University of Oklahoma) to confirm species identification.

TABLE 4
SUMMARY OF CROTCH'S BUMBLE BEE SURVEYS

Survey Number	Survey Location	Date	Time (Start/End)	Acres Surveyed (acres)	Surveyor	Weather Conditions		
						Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)
1	Downstream of Santiago Creek Dam	June 20, 2024	9:00 AM/ 3:00 PM	15	Messett	66/80	1–1/1–2	0/0
1	Upstream of Santiago Creek Dam	June 21, 2024	8:10 AM/ 3:55 PM	35	Messett	68/76	0–1/4–5	0/0
2	Downstream of Santiago Creek Dam	July 16, 2024	9:00 AM/ 2:50 PM	15	Messett	68/81	0–1/3–4	10/0
2	Upstream of Santiago Creek Dam	July 17, 2024	8:00 AM/ 3:45 PM	35	Messett	71/80	1–2/1–2	75/30
3	Downstream of Santiago Creek Dam	August 5, 2024	9:00 AM/ 12:50 PM	15	Messett	80/92	1–2/1–2	0/0

°F: Fahrenheit; mph: miles per hour; %: percent.

The results of the Crotch's bumble bee surveys are included in Appendix G.

2.3.4 Western Spadefoot

There is currently no standardized survey protocol in place for this species. Survey methods were based on the biology of the western spadefoot and survey protocols for other currently listed anurans (i.e., frogs and toads) to maximize the likelihood of detection.

Focused surveys for this species were conducted throughout the BSA in spring 2025. Three surveys have been conducted, with one in February, one in March, and one in April. Each of the surveys was conducted within three days following rain events. These surveys included diurnal and nocturnal components to search for the presence of egg masses, tadpoles, and adults. The diurnal portion of the survey focused on searches for the presence of egg masses and tadpoles. Nocturnal surveys focused on searches for active juveniles and calling adults. Flashlights and headlamps were used at night to search for and visually identify any toads detected. Because spadefoots can be sensitive to sounds and light, the Biologists stopped and remained still for extended periods to listen for calls.

Psomas Senior Biologists Jonathan Aguayo and Lindsay Messett conducted the focused surveys in all potentially suitable habitat for western spadefoot in the BSA. Mr. Aguayo and Ms. Messett conducted focused surveys for the western spadefoot on February 14; March 13; and April 4, 2025, during favorable weather conditions conducive to good toad activity. The dates and weather conditions during each survey are provided in Table 5.

TABLE 5
SUMMARY OF SURVEY CONDITIONS FOR
WESTERN SPADEFOOT SURVEYS

Survey Number	Date	Time (Start/End)	Biologists	Weather Conditions		
				Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)
1 (Day)	February 14, 2025	2:52 PM–6:03 PM	Aguayo Messett	58/54	7/6	70/60
1 (Night)	February 14, 2025	6:37 PM–8:56 PM	Aguayo Messett	53/52	5/3	50/40
2 (Day)	March 13, 2025	3:58 PM–7:12 PM	Aguayo Messett	52/49	13/11	60/70
2 (Night)	March 13, 2025	7:56 PM–9:55 PM	Aguayo Messett	48/47	9/5	70/80
3 (Day)	April 4, 2025	4:09 PM–7:18 PM	Aguayo Messett	67/61	8/4	10/0
3 (Night)	April 4, 2025	7:59 PM–10:34 PM	Aguayo Messett	59/53	3/2	0/0

°F: Fahrenheit; mph: miles per hour; %: percent; nr: not recorded

The focused survey report documenting the results of these surveys is in preparation.

2.3.5 Arroyo Toad

USFWS survey protocol for the arroyo toad requires that a minimum of six surveys be performed during the breeding season (i.e., March 15–July 1), with at least one survey conducted in April, one in May, and one in June. The surveys included diurnal and nocturnal searches to determine the presence of eggs, tadpoles, and adults. During the diurnal surveys, water was examined for the presence of arroyo toad (*Anaxyrus californicus*) egg masses and tadpoles. Nocturnal surveys began one hour after dusk during weather conditions conducive to toad activity. Nocturnal search methods included walking along the creek banks and stopping periodically to listen for the breeding calls of adult males. Headlamps and flashlights were used to visually identify toads when a breeding call was heard. If any arroyo toads were found, the individual or population was documented, recorded with a GPS unit, and mapped on an aerial photograph. The number of individuals were noted on each subsequent visit, and data were collected on general habitat characteristics for any arroyo toads observed.

Psomas Senior Biologists Jonathan Aguayo and Lindsay Messett conducted the focused surveys in all potentially suitable habitat for arroyo toad in the survey area according to the survey methodology described above. The 2020 survey area included all suitable habitat downstream of the dam along Santiago Creek, extending 0.62 mile (1 kilometer) downstream of the BSA, which included a tributary from Fremont Canyon. Mr. Aguayo and Ms. Messett conducted focused surveys for the arroyo toad on April 17 and 24; May 15 and 22; and June 12 and 19, 2020. The 2022 survey area included all suitable habitat along Santiago Creek upstream of the dam. Mr. Aguayo and Ms. Messett conducted focused surveys for the arroyo toad on March 25; April 1 and 8; May 27; and June 10 and 23, 2022.

Diurnal surveys were conducted from approximately 4:00 PM until dusk, and nocturnal surveys were conducted from one hour after dusk until approximately 11:00 PM. Surveys focused on detecting toads by visual identification; listening for the advertising call of adult males; and checking potentially suitable breeding habitat for tadpoles and/or eggs. Biologists scanned pools for eggs, larvae, metamorphs, juveniles; breeding and/or calling adults in potentially suitable breeding locations along the creek; and foraging individuals in the adjacent riparian and upland areas. Mr. Aguayo and Ms. Messett moved in an upstream direction during the surveys. Headlamps, flashlights, and binoculars were used to visually identify toads, frogs, and their larvae detected at night. Nocturnal surveys were conducted during appropriate environmental conditions conducive to the activity patterns of the arroyo toad. Generally, these conditions are nighttime temperatures greater than 50 degrees Fahrenheit (°F) at dusk, with low winds (less than 10 miles per hour). Surveys were not scheduled on nights with a full or nearly full moon because arroyo toad activity is lower on these nights due to higher predation risk. Survey dates, times, and weather data are shown in Table 6. Survey conditions and results were documented in field notes.

The results of the arroyo toad surveys are included in Appendix H.

2.3.6 Southwestern Pond Turtle

2.3.6.1. Visual Survey

There is currently no standardized USFWS protocol in place for the southwestern pond turtle; therefore, surveys generally followed the Visual Survey Protocol for the Southcoast Ecoregion (USGS 2006a). Survey methods were focused on the detection of southwestern pond turtle adults and juveniles through visual observation; the visual surveys did not include dip netting or seining. Any southwestern pond turtles observed would have been documented and recorded using a Global Positioning System (GPS) or iPad to map the location on an aerial photograph.

Psomas Senior Biologist Jonathan Aguayo conducted visual surveys across all potentially suitable habitats for the southwestern pond turtle within the BSA. He walked slowly up the stream channel, either in the water or immediately adjacent to the water, visually searching for pond turtles with and without binoculars, concentrating on pools, surface water, banks, and suitable basking sites within the BSA. He searched aquatic habitat with and without

binoculars for the presence of basking or underwater pond turtles. He observed open pools or possible basking areas from a distance and then approached slowly and quietly to help prevent disturbing basking turtles. He listened for the splash of water, which could indicate possible unseen turtles entering the water. If a splash was heard, he spent additional time observing the area for a turtle to resurface. Visual surveys were performed on August 20 and 30, 2024, during weather conditions favorable for turtle activity (Table 7).

TABLE 7
SUMMARY OF SURVEY CONDITIONS FOR
SOUTHWESTERN POND TURTLE VISUAL SURVEYS

Survey Number	Date	Time (Start/End)	Biologist	Weather Conditions		
				Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)
1	August 20, 2024	8:00 AM/2:30 PM	Aguayo	72/96	2/6	0/0
2	August 30, 2024	9:20 AM/3:40 PM	Aguayo	67/81	1/5	80/0

Turtle Trapping

Trapping surveys follow the methodology outlined in the Western Pond Turtle Trapping Survey Protocol for the Southcoast Ecoregion (USGS 2006b). A five-day/four-night trapping program was conducted in August 2024. Nylon mesh hoop traps and floating basking traps were placed in suitable locations in Irvine Lake, baited with cans of sardines in oil to attract turtles. Traps were set near habitat features likely to be used by pond turtles (possible basking areas, areas with underwater refugia). The hoop traps measured 2.5 feet in diameter by 6 feet long with 1-inch square mesh and featured a one-way funnel entrance. Floating basking traps measured 20 inches wide by 28 inches long and 13 inches deep, with two 13-inch wings. Both hoop and basking traps were equipped with floats and securely fastened to immovable objects to prevent submersion to allow for captured turtles (and other animals) to surface for air.

Traps were left in place for a maximum of 24 hours before being checked by Biologists to retrieve captured turtles and other aquatic species (e.g. fish, frogs, invertebrates). General weather data (i.e., ambient air temperature, sky conditions, wind speed) and water temperature were recorded at the start and end of each trapping session. Two trapping sessions, one on the west side of Irvine Lake and another on the east side of Irvine Lake, were required to adequately cover Irvine Lake. As described above, Santiago Creek was surveyed visually because it was not deep enough for trap placement.

Mr. Aguayo (Scientific Collecting Permit [SCP] ID: S-190310010-20076-001) and Senior Biologist Lindsay Messett (SCP ID: S-182810004-20009-001) were the Principal Investigators for the trapping sessions, with assistance from Psomas Biologists Trevor Bristle, Jack Underwood, Cristina Juran, and Tyler Glaser. Both Mr. Aguayo and Ms. Messett are knowledgeable about the southwestern pond turtle and hold the necessary CDFW

authorization to trap and handle the species. All traps were tagged with Mr. Aguayo's CDFW SCP number, under which the live trapping was conducted.

Trapping sessions were conducted from August 19–23, 2024, on the west side of Irvine Lake and from August 26–30, 2024, on the east side of Irvine Lake. Surveys were conducted during weather conditions favorable for turtle activity (Table 8). A total of 24 hoop traps and 3 basking traps were set in Irvine Lake. Trap locations were selected based on suitable habitat with traps spaced 820 feet (i.e., 250 meters) apart. The number of traps set was proportionate to the overall size of the lake.

TABLE 8
SUMMARY OF SURVEY DATA AND CONDITIONS
FOR SOUTHWESTERN POND TURTLE TRAPPING

Survey Number	Survey Date	Surveying Biologists	Start/End Time	Water Temperature (°F)		Wind (mph)		Temperature (°F)		Cloud Cover (%)

The results of the southwestern pond turtle surveys are included as Appendix I.

2.3.7 Coastal California Gnatcatcher

USFWS survey protocol for the coastal California gnatcatcher requires three visits, conducted at least one week apart, to all potentially occupied habitat areas for surveys within an NCCP area (USFWS 1997a, 1997b). All visits must be conducted between 6:00 AM and 12:00 PM, and no more than 100 acres of suitable habitat may be surveyed per visit.

Psomas Senior Biologist Lindsay Messett (USFWS Permit No. TE 067064-5) conducted all focused surveys for coastal California gnatcatcher. The 2020 survey area for the gnatcatcher surveys included all suitable habitat (i.e., sagebrush scrub, disturbed sagebrush scrub, and disturbed floodplain sagebrush scrub) downstream of the dam and within a 500-foot buffer around the tentative impact footprint. The 2022 survey area for the gnatcatcher surveys includes all suitable habitat upstream of the dam in the BSA. The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (i.e., Irvine Lake). The 2020 surveys were conducted on April 30, May 27, and June 25, 2020. The 2022 surveys were conducted on March 25, April 4, and June 9, 2022.

Ms. Messett avoided weather conditions that were too cold (i.e., below 55 degrees Fahrenheit [°F]), too hot (i.e., above 95°F), or too windy (i.e., wind speed greater than 15 miles per hour) to comply with USFWS survey protocol requirements. A summary of weather conditions during each survey is provided in Table 9, below. Ms. Messett conducted the surveys by slowly walking through all appropriate habitats while listening and watching for gnatcatcher activity and by using a combination of recordings of gnatcatcher vocalizations and "pishing" sounds to elicit responses from any gnatcatchers present. The frequency of vocalization playback and "pishing" varied depending on conditions such as habitat patch size, topography in each area, and ambient noise conditions.

The results of the coastal California gnatcatcher surveys are included as Appendix J.

2.3.8 Least Bell's Vireo/Southwestern Willow Flycatcher

USFWS protocol for the least Bell's vireo (*Vireo bellii pusillus*) requires that at least eight surveys be conducted from April 10 to July 31 with a ten-day interval between each site visit (USFWS 2001). The USFWS protocol for the southwestern willow flycatcher requires a total of five surveys, with the first survey conducted between May 15 and May 31; the second and third surveys between June 1 and June 24; and the fourth and fifth surveys between June 25 and July 17 (Sogge et al. 2010).

Psomas Senior Biologist Lindsay Messett conducted all 2020 focused surveys for least Bell's vireo downstream of the dam. The 2020 survey area for the least Bell's vireo surveys included all suitable habitat (i.e., southern willow scrub and mule fat scrub) downstream of the dam and within a 500-foot buffer north of the BSA along Santiago Creek. The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (i.e., Irvine Lake). Surveys were conducted on April 30, May 12 and 27, June 9, and 25, and July 6, 17, and 28, 2020.

Psomas Senior Biologist Jonathan Aguayo (USFWS Permit No. TE 96514A-3) conducted all focused surveys for least Bell's vireo and southwestern willow flycatcher upstream of the dam. Because the survey area contained more than 80 acres of suitable habitat, 2 days were required to cover the entire survey area for each of the 8 visits. Mr. Aguayo conducted focused surveys for the least Bell's vireo on April 13, 14, 24, and 25; May 12, 13, 25, and 26; June 7, 8, 21, and 22; and July 1, 4, 13, and 14, 2022. Focused surveys for southwestern willow flycatcher were conducted on May 25 and 26; June 7, 8, 21, and 22; and July 1, 4, 13, and 14, 2022. Per guidance issued from the USFWS, focused surveys for least Bell's vireo and southwestern willow flycatcher were not conducted concurrently. During the last five surveys, surveys were conducted for southwestern willow flycatcher first; surveys for least Bell's vireo followed (described below).

As mentioned above, the surveys were conducted sequentially, with surveys for the southwestern willow flycatcher conducted first (i.e., first thing in the morning) and surveys for the least Bell's vireo conducted afterwards. The survey area was split into two mainly linear routes; therefore, southwestern willow flycatchers were surveyed from the starting point to the end, and least Bell's vireos were surveyed on the way back. All bird species detected during the survey were recorded, including notable observations of special status species or other birds (e.g., brown-headed cowbird). A complete list of wildlife species observed during the surveys is included in Appendix D.

Ms. Messett and Mr. Aguayo systematically surveyed the riparian habitats by walking slowly and methodically along their margins; habitat is narrow enough that transects through the habitat were not necessary. Following the willow flycatcher protocol, recorded vocalizations were used to elicit a response from any potentially territorial southwestern willow flycatchers. As the least Bell's vireo survey protocol does not require the playback of least Bell's vireo vocalizations, recorded least Bell's vireo vocalizations were not used during the surveys. Any least Bell's vireos or southwestern willow flycatchers detected were recorded

with a GPS unit (Garmin Vista) or an iPad. Because of the high density of least Bell's vireos in the survey area upstream of the dam, great care was taken in the field to verify that adjacent territories were occupied by distinct males. Although not required during a presence/absence survey, time was also taken to visually observe any individuals detected to identify their sex and age to determine the fate of the territory over the course of the surveys (e.g., juveniles observed indicate successful nesting).

All surveys were conducted under optimal weather conditions and during early morning hours when bird activity is at its peak (Table 10). It should be noted that the timing of a few of the 2020 surveys began later because on these mornings, Ms. Messett was surveying for coastal California gnatcatcher in the adjacent upland habitat. If a least Bell's vireo was singing during the gnatcatcher survey, Ms. Messett likely would have heard it in the adjacent riparian habitat. As mentioned above, the 2022 surveys were conducted sequentially, with surveys for the southwestern willow flycatcher conducted first (i.e., first thing in the morning) and surveys for the least Bell's vireo conducted afterwards. The survey area was split into two mainly linear routes; therefore, southwestern willow flycatchers were surveyed from the starting point to the end, and least Bell's vireos were surveyed on the way back. All bird species detected during the survey were recorded, including notable observations of special status species or other birds (e.g., brown-headed cowbird [*Molothrus ater*]).

The results of the least Bell's vireo/southwestern willow flycatcher surveys are included in Appendix K.

2.3.9 Western Yellow-billed Cuckoo

The USFWS survey protocol for western yellow-billed cuckoo requires a minimum of four surveys be conducted in three time periods that span the peak of breeding activity for the western populations of this species: (1) one survey is required from June 15 to June 30 when migrating yellow-billed cuckoos are passing through but breeding birds are also arriving; (2) two surveys are required from July 1 to July 31 when individual cuckoos encountered are mostly breeders but are occasionally migrants, wandering individuals, or young of the year; and (3) one survey is required from August 1 to August 15 when most breeding yellow-billed cuckoos have finished breeding activities and are departing. Each survey needs to be conducted 12 to 15 days apart. Focused surveys were conducted by Lindsay Messett (TE-067064-5).

The survey area for the western yellow-billed cuckoo includes all suitable riparian habitats upstream of the dam. The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (i.e., Irvine Lake).

Ms. Messett systematically surveyed the riparian habitats by walking slowly and methodically along the margins of riparian habitat and using meandering transects through the riparian habitat in the survey area. Per USFWS survey protocol for the species, Ms. Messett played recorded contact or "kowlp" calls of western yellow-billed cuckoo five times at one-minute intervals at each calling station (or point) established in the survey area. Compact speakers capable of broadcasting recorded bird calls in excess of 70 decibels were used during all surveys. Upon arriving at each calling point, Ms. Messett listened and watched for cuckoos for one minute prior to playing the broadcast contact calls. Calling points were established approximately every 328 feet in riparian habitat that provided potentially suitable or marginally suitable habitat for the western yellow-billed cuckoo. All surveys were conducted under optimal weather conditions (i.e., between 55 degrees Fahrenheit [°F] and 95°F with wind speeds between 0 and 15 miles per hour) and during the morning hours when bird activity is at a peak (Table 11). Additionally, per USFWS guidelines, all incidental observations of least Bell's vireo and willow flycatcher (*Empidonax trailli*) were recorded and mapped.

TABLE 11
SUMMARY OF SURVEY DATA AND CONDITIONS FOR
WESTERN YELLOW-BILLED CUCKOO SURVEYS

The results of the western yellow-billed cuckoo surveys are included in Appendix L.

2.3.10 Jurisdictional Delineation

Jurisdictional water resources considered for this report include waters of the United States (WOTUS) under the regulatory authority of the USACE; waters of the State under the regulatory authority of the RWQCB; and the bed, bank, and channel of all lakes, rivers, and/or streams (and associated riparian vegetation), under the regulatory authority of CDFW.

Psomas assessed the presence of WOTUS by determining connectivity or adjacency of on-site features to points of discharge at a Traditional Navigable Waterway. Non-wetland WOTUS are delineated based on the limits of the Ordinary High Water Mark (OHWM), which can be determined by a number of factors, including (1) the presence of a clear, natural line impressed on the bank; (2) shelving; (3) changes in the character of the soil; (3) destruction of terrestrial vegetation; and (4) the presence of litter and debris. The OHWM limits (i.e., active floodplain) occurring in the BSA were further verified using methods contained in *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States*, *A Delineation Manual* (Lichvar and McColley 2008) and the *Updated Datasheet for the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Curtis and Lichvar 2010).

In September 2008, the USACE issued the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008). This regional supplement is designed for use with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987). Both the 1987 Wetlands Manual and the Arid West Supplement to the manual provide technical methods and guidelines for determining the presence of wetland WOTUS. Both documents prescribe using a three-parameter approach to identify wetlands. The three parameters needed to assign a site as a wetland include evidence of wetland hydrology, hydrophytic vegetation, and hydric soils. However, problem areas may periodically or permanently lack certain indicators due to seasonal or annual variability or

the nature of the soils or plant species on site. Atypical wetlands lack certain indicators due to recent human activities or natural events. Guidance for determining the presence of wetlands in these situations is presented in the regional supplement.

Psomas determined the limits of RWQCB jurisdiction in the field following the methods described for USACE jurisdiction, above. RWQCB shares USACE jurisdiction unless isolated conditions are present. If isolated waters are present, RWQCB takes jurisdiction using USACE's definition of the OHWM. In 2019, SWRCB adopted a new wetland definition, which includes areas with (1) continuous or recurrent saturation of the upper substrate of sufficient duration to cause anaerobic conditions and (2) vegetation dominated by hydrophytes or lacking vegetation (SWRCB 2019). This new definition went into effect on May 28, 2020.

CDFW's jurisdiction was determined by measuring the distance between the top of the bank to the top of the bank of the water features on site or, if present, to the outer limit of riparian vegetation located within or immediately adjacent to the feature. CDFW jurisdiction within Irvine Lake extended to the top of the existing dam embankment.

The jurisdictional delineation for the portion of the BSA downstream of the dam was conducted by Psomas on March 24, 2020. The jurisdictional delineation for the portion of the BSA upstream of the dam was conducted on October 14, 20, and 21, 2020. Psomas Senior Regulatory Specialist Allison Rudalevige performed all surveys with assistance from Psomas Senior Biologist Jonathan Aguayo on October 14 and 20 and Psomas Senior Biologist Lindsay Messett on October 21. Areas under USACE, RWQCB, and CDFW authority were delineated using an aerial photograph (scale of 1-inch equals 175 feet [1″ = 175′] downstream of the dam and scale 1″ = 275′ upstream of the dam) overlaid with 5-foot topographic contour data loaded onto Avenza Maps application on an iPad. Large drainage features and waterbodies were delineated as polygons and narrow drainages were delineated as centerlines with corresponding width measurements. Soil test pits were dug in areas that exhibited potential hydrophytic vegetation and wetland hydrology.

The results of the jurisdictional delineation are included as Appendix M.

3.0 EXISTING BIOLOGICAL RESOURCES

3.1 PHYSICAL ENVIRONMENTAL SETTING

3.1.1 Regional Environment

The Project is generally located in the coastal foothills of eastern Orange County. Topographically, this region exhibits low-lying ridgelines and hills with interspersed relatively broad valley and canyon bottoms. Elevations in the BSA range from approximately 657 to 996 feet above msl.

Within the eastern Orange County area, there are numerous designated open space areas. The largest areas in proximity to the BSA include the following: the 1,000-acre NCCP Reserve, Limestone Canyon Regional Park, Whiting Ranch Wilderness Park, Santiago Oaks Regional Park, Irvine Regional Park, and Cleveland National Forest. In addition to designated open space, other non-designated open space areas within the region include other undeveloped land in the foothills of Santiago Canyon.

3.1.2 Climate

Southern California experiences a Mediterranean climate characterized by mild, rainy winters and hot, dry summers. The temperature is moderated by the coastal influence of the Pacific Ocean, which creates mild conditions throughout most of the year. The most distinguishing characteristic of a Mediterranean climate is its seasonal precipitation. In Southern California, precipitation is characterized by brief, intense storms between November and March. It is not unusual for the majority of the annual precipitation to fall during a few storms over a short span of time.

Rainfall patterns in the region are subject to extreme variations from year to year and longer-term wet and dry cycles. The region received approximately 17.7 inches of precipitation between August 2019 and July 2020 (data taken from Irvine – South Coast Valleys Station No. 75) (CIMIS 2020). The region received approximately 7.1 inches of precipitation between July 2021 and June 2022 and approximately 9.3 inches of precipitation between July 2021 and June 2022 (data taken from Irvine – South Coast Valleys Station No. 75) (CIMIS 2022). The average annual precipitation for this area is between 10 and 13 inches.

Climate change refers to any significant change in climate, such as the average temperature, precipitation, or wind patterns over a period of time. Significant changes in global climate patterns have been associated with an accumulation of greenhouse gas emissions in the atmosphere. Some greenhouse gases occur naturally and are emitted to the atmosphere through natural processes, while others are created and emitted solely through human activities; the majority of global warming is attributed to human activities. In addition to affecting temperature and precipitation patterns, climate change is believed to be contributing to more extreme weather events such as more frequent larger storms and extended periods of drought (USFS 2018, US EPA 2017).

In the Cleveland National Forest, climate change effects are changing fire patterns and disease outbreaks and affecting water supplies (USFS 2018). Fires are a natural part of the landscape, but each year the fire season is coming earlier and ending later. In addition, the fires themselves are burning hotter and have become more damaging and dangerous. Similarly, insects are a natural part of forested landscapes, but now the insects are spreading more rapidly because the winter is not cold enough to reduce their populations. Also, insect-caused disease epidemics are larger and last longer, killing more trees and increasing fire risk. The warmer winters are affecting water supplies because the snow packs are thinner and melt earlier in spring, so the water runs out from the forest earlier in summer. Extended droughts also make trees more vulnerable to both fire and insects (USFS 2018).

Two significant fires have recently burned in the vicinity of the BSA. The Silverado Fire began in October of 2020 and burned approximately 12,466 acres of open space south of the BSA. The 2020 Bond Fire is located north and east of the previous Silverado Fire. The Bond Fire burned approximately 6,686 acres (CalFire 2020). These fires were two of three significant fires that were burning concurrently in Southern California in the fall of 2020 during unusually powerful and long-lasting Santa Ana Wind conditions.

3.1.3 Local Environment

Irvine Lake (named Santiago Creek Reservoir on the USGS, Exhibit 3) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east of the BSA include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the BSA in the northwest, downstream of the dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the BSA. Elevations in the BSA range from approximately 657 to 996 feet above msl.

Soils mapped in the BSA include Alo variant clay, Anaheim loam, Anaheim clay loam, Balcom-rock outcrop complex, beaches, Bosanko clay, Botella loam, Botella clay loam, Calleguas clay loam, Capistrano sandy loam, Cieneba sandy loam, Cieneba–rock outcrop complex, Corralitos loamy sand, Myford sandy loam, pits, riverwash, rock outcrop–Cieneba complex, Soboba gravelly loamy sand, Soper loam, Soper gravelly loam, Soper cobbly loam, Soper–rock outcrop complex, and Sorrento loam (USDA NRCS 2020) (Exhibit 5).

3.2 VEGETATION TYPES AND OTHER AREAS

The following vegetation types occur in the BSA: sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore-coast live oak riparian woodland, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, and western sycamore, and vegetated fluctuating shoreline (Exhibit 6; Table 12). Other

landcover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

[a] Ranked as sensitive based on less than 10 stands sampled; may be more widespread (CDFW 2025b).
[b] This blended community would be characterized more as riparian herb than southern black willow forest; therefore, it would not be considered a sensitive community.

BSA: Biological Survey Area

3.2.1 Sagebrush Scrub (2.3.6)

Sagebrush scrub is distributed throughout the BSA on the slopes surrounding Irvine Lake. This vegetation type is dominated by relatively dense California sagebrush (*Artemisia californica*). Other native shrubs are also scattered throughout these areas and include leafy California buckwheat (*Eriogonum fasciculatum var. foliolosum*), deerweed (*Acmispon glaber*), laurel sumac (*Malosma laurina*), lemonade berry (*Rhus integrifolia*), and toyon (*Heteromeles arbutifolia*). The density of these co-occurring species varies across the BSA. Where present, openings between shrubs have native herbs, such as erect plantain (*Plantago erecta*) and narrow-toothed pectocarya (*Pectocarya linearis* ssp. *ferocula*). Sparse amounts of scaly scale-broom (*Lepidospartum squamatum*) extend into this vegetation where it occurs along Santiago Creek downstream of the dam.

Sagebrush scrub is consistent with the *Artemisia californica* association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b). However, sagebrush scrub is protected by the NCCP/HCP.

3.2.2 Disturbed Sagebrush Scrub (2.3.6)

Disturbed sagebrush scrub is distributed downstream of the dam and along slopes in the southern portion of the BSA. It is similar in composition to sagebrush scrub but it has an open canopy and the spaces between the shrubs are degraded (disturbed) by the presence of non-native grasses and herbs such as bromes (*Bromus* spp.), oats (*Avena* spp.), grayish shortpod mustard (*Hirschfeldia incana*), and/or black mustard (*Brassica nigra*).

Disturbed sagebrush scrub is consistent with the *Artemisia californica* association mixed with one or more of the annual brome grasslands or the upland mustard associations in *A Manual of California Vegetation* (CNPS 2024). These associations are not considered sensitive natural communities by CDFW (2025b). However, disturbed sagebrush scrub is protected by the NCCP/HCP.

3.2.3 Sagebrush – Coyote Brush Scrub (2.3.12)

Sagebrush – coyote brush scrub is distributed on slopes in the southern portion of the BSA. This vegetation type is co-dominated by California sagebrush and coyote brush (*Baccharis pilularis* ssp. *consanguinea*) with lesser amounts of leafy California buckwheat, laurel sumac, lemonade berry, toyon, and white sage (*Salvia apiana*).

Sagebrush – coyote brush scrub is consistent with the *Baccharis pilularis – Artemisia californica* association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b). However, sagebrush – coyote brush scrub is protected by the NCCP/HCP.

3.2.4 Southern Cactus Scrub (2.4)

Southern cactus scrub is distributed on slopes on the northern side of Irvine Lake. This vegetation type is characterized by approximately 20 percent cover of prickly-pear (either *Opuntia littoralis* or *Opuntia x vaseyi*). These areas also contain California sagebrush, leafy California buckwheat, laurel sumac, and other sagebrush scrub species.

Southern cactus scrub is consistent with the *Artemisia californica – Opuntia littoralis* association in *A Manual of California Vegetation* (CNPS 2024). This association is considered a provisional[10] sensitive natural community by CDFW (2025b). Southern cactus scrub is also protected by the NCCP/HCP.

3.2.5 Disturbed Southern Cactus Scrub (2.4)

Disturbed southern cactus scrub is located in the southwestern portion of the BSA. This vegetation type is characterized by the presence of prickly-pear with other native shrubs such as California sagebrush and leafy California buckwheat. However, it is degraded (disturbed) by the presence of non-native grayish shortpod mustard and pepper tree (*Schinus molle*).

[10] Ranked as sensitive based on less than 10 stands sampled; may be more widespread (CDFW 2023a).

Disturbed southern cactus scrub is consistent with the *Artemisia californica – Opuntia littoralis* association mixed with one or more of the annual brome grasslands or the upland mustard associations in *A Manual of California Vegetation* (CNPS 2024). The *Artemisia californica – Opuntia littoralis* association is considered a provisional[3] sensitive natural community by CDFW (2025b). Disturbed southern cactus scrub is also protected by the NCCP/HCP.

3.2.6 Disturbed Floodplain Sage Scrub (2.6)

Disturbed floodplain sage scrub occurs along the active floodplain/low terrace of Santiago Creek downstream of the dam. This vegetation type is characterized by the presence of scaly scale-broom along a rocky alluvial wash. As is typical of this vegetation type, shrub density is relatively low. Other species that co-occur include California sagebrush, California brickellbush (*Brickellia californica*), straw-colored cudweed (*Pseudognaphalium stramineum*), and chilicothe (*Marah macrocarpa*). This vegetation type is degraded (disturbed) by the presence of non-native fennel (*Foeniculum vulgare*) and non-native grasses.

Disturbed floodplain sage scrub is consistent with the *Lepidospartum squamatum – Artemisia californica* association mixed with the *Foeniculum vulgare* association in *A Manual of California Vegetation* (CNPS 2024). The *Lepidospartum squamatum – Artemisia californica* association is considered a sensitive natural community by CDFW (2025b). Disturbed floodplain sage scrub is also protected by the NCCP/HCP.

3.2.7 Toyon – Sumac Chaparral (3.12)

Toyon – sumac chaparral is distributed downstream of the dam and on the slopes in the western portion of the BSA. The dominant shrub is laurel sumac; however, lemonade berry, toyon, blue elderberry (*Sambucus mexicana*), and coast live oak (*Quercus agrifolia*) co-occur in some areas. The patch on the east side of Santiago Creek downstream of the dam also contains Coulter's matilija poppy (*Romneya coulteri*), a special status plant species. This vegetation type intergrades with coastal sage scrub and annual brome grassland.

Toyon – sumac chaparral is consistent with the *Malosma laurina* association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b).

3.2.8 Annual Grassland (4.1)

Annual grassland is distributed primarily downstream of the dam but also occurs in small patches in the southwestern portion of the BSA. This vegetation type is dominated by non-native grasses, including red brome (*Bromus rubens*), ripgut grass (*Bromus diandrus*), slender wild oat (*Avena barbata*), wild oat (*Avena fatua*), and wall barley (*Hordeum murinum*). Other non-native species, such as grayish shortpod mustard, black mustard, and tocalote (*Centaurea melitensis*) are also present. Most areas contain scattered native species such as miner's-lettuce (*Claytonia perfoliata*), fascicled tarplant (*Deinandra fasciculata*), telegraph weed (*Heterotheca grandiflora*), turkey-mullein (*Croton setiger*), and fiddleneck (*Amsinckia* spp.). The slope up to the dam contains a greater cover of native species,

including miniature lupine (*Lupinus bicolor*), common goldfields (*Lasthenia gracilis*), erect plantain, and valley popcorn flower (*Plagiobothrys canescens*). This slope may have been seeded with a native seed mix following a previous disturbance.

Annual grassland has characteristics of the *Bromus diandrus – Avena* spp., *Bromus diandrus* – mixed herbs, *Bromus rubens* – mixed herbs, *Brassica nigra – Bromus diandrus*, and *Hirschfeldia incana* associations in *A Manual of California Vegetation* (CNPS 2024). None of these associations are considered sensitive natural communities by CDFW (2025b).

3.2.9 Ruderal (4.6)

Ruderal (weedy) vegetation occurs in broad, flat areas and slopes in the eastern and southern portions of the BSA and along small portions of the shoreline around Irvine Lake. This vegetation type is dominated by grayish shortpod mustard. The area adjacent to the west of the dam is a monoculture of common castor bean (*Ricinus communis*), a non-native species.

Most of the ruderal vegetation in the BSA is consistent with the *Hirschfeldia incana* association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b).

3.2.10 Riparian Herb (7.1)

Riparian herb is distributed just above the shoreline around Irvine Lake throughout the BSA. This vegetation type is dominated by cocklebur (*Xanthium strumarium*) with lesser amounts of white sweetclover (*Melilotus albus*), alkali-mallow (*Malvella leprosa*), and grayish shortpod mustard.

Riparian herb is consistent with the *Xanthium strumarium* association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b).

3.2.11 Southern Willow Scrub (7.2)

Southern willow scrub occurs in one location along Santiago Creek downstream of the dam. This vegetation type is dominated by arroyo willow (*Salix lasiolepis*) with scattered white alder (*Alnus rhombifolia*), western sycamore (*Platanus racemosa*), and Fremont cottonwood (*Populus fremontii* ssp. *fremontii*). The understory contains scattered mule fat (*Baccharis salicifolia* ssp. *salicifolia*), California sagebrush, flatsedge (*Cyperus* sp.), and non-native grasses. A depression in the streambed holds standing water surrounded by broad-leaved cattail (*Typha latifolia*).

Southern willow scrub is consistent with the *Salix lasiolepis* association in *A Manual of California Vegetation* (CNPS 2024). This association is considered a sensitive natural community by CDFW (2025b).

3.2.12 Mulefat Scrub (7.3)

Mulefat scrub primarily occurs along the low flow channel of Santiago Creek downstream of the dam. It also occurs upstream of the dam in one patch adjacent to the east end of the dam structure. It is dominated by a varying cover of mule fat; scaly scale-broom also occurs. Downstream of the dam, this vegetation type includes some low cover of non-native fennel and mustards.

Mulefat scrub is consistent with the *Baccharis salicifolia* association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b).

3.2.13 Disturbed Mulefat Scrub (7.3)

Disturbed mulefat scrub is distributed above the shoreline of Irvine Lake and extending upstream of the lake along the low-flow channel of Santiago Creek. This vegetation type is dominated by scattered mule fat; however, it is degraded (disturbed) by the presence of saltcedar (*Tamarix ramosissima*), giant reed (*Arundo donax*), and grayish shortpod mustard.

Disturbed mulefat scrub is consistent with the *Baccharis salicifolia – Tamarix ramosissima* or *Baccharis salicifolia – Arundo donax* associations in *A Manual of California Vegetation* (CNPS 2024). These associations are not considered sensitive natural communities by CDFW (2025b).

3.2.14 Southern Sycamore Riparian Woodland (7.4)

Southern sycamore riparian woodland is located in one location at the upstream end of Santiago Creek in the eastern portion of the BSA. This vegetation type consists of a closed riparian canopy dominated by western sycamore. Other species in the tree canopy include Goodding's black willow, arroyo willow, Fremont cottonwood, and coast live oak; a few scattered gum trees (*Eucalyptus* spp.) are also present. The understory and margins contain mule fat.

Southern sycamore riparian woodland is consistent with the *Platanus racemosa–Populus fremontii/Salix lasiolepis* association in *A Manual of California Vegetation* (CNPS 2024). This association is considered a sensitive natural community by CDFW (2025b).

3.2.15 Southern Sycamore Riparian Woodland/Coast Live Oak Riparian Forest (7.4/7.5)

Southern sycamore riparian woodland/coast live oak riparian forest is distributed in a few patches in the southeastern portion of the BSA and in one location north of Irvine Lake. This vegetation type is co-dominated by western sycamore and coast live oak trees in a savannah-like setting. The understory and area between trees are dominated by grayish shortpod mustard and tree tobacco (*Nicotiana glauca*).

Southern sycamore riparian woodland/coast live oak riparian forest is consistent with the *Platanus racemosa–Quercus agrifolia* association in *A Manual of California Vegetation* (CNPS 2024). This association is considered a sensitive natural community by CDFW (2025b).

3.2.16 Southern Black Willow Forest (7.7)

Southern black willow forest occurs along tributary drainages in the southern portion of the BSA, upstream of the lake along Santiago Creek, and in a few patches above the shoreline of Irvine Lake. This vegetation type is dominated by a tree canopy of Goodding's black willow (*Salix gooddingii*); mule fat is abundant in the understory, along the margins, and between the tree canopy.

Southern black willow forest is consistent with the *Salix gooddingii/Baccharis salicifolia* association in *A Manual of California Vegetation* (CNPS 2024). This association is considered a sensitive natural community by CDFW (2025b).

3.2.17 Disturbed Southern Black Willow Forest (7.7)

Disturbed southern black willow forest is distributed above the shoreline of Irvine Lake and upstream of the lake along Santiago Creek. This vegetation type is characterized by the presence of Goodding's black willow and mule fat; however, it is degraded (disturbed) by the presence of non-native species such as saltcedar, giant reed, grayish shortpod mustard, and non-native grasses. In many areas, the tree canopy is sparse.

Disturbed southern black willow forest is consistent with the *Salix gooddingii/Baccharis salicifolia* association mixed with the *Tamarix* spp. association in *A Manual of California Vegetation* (CNPS 2024). The *Salix gooddingii/Baccharis salicifolia* association is considered a sensitive natural community by CDFW (2025b).

3.2.18 Southern Black Willow Forest/Riparian Herb (7.7/7.1)

Southern black willow forest/riparian herb is distributed in broad, flat areas near fluctuating shoreline and vegetated fluctuating shoreline near the upstream end of Irvine Lake and in the southern portion of the BSA. This vegetation type contains sparse Goodding's black willow scattered throughout an area dominated by cocklebur. Based on historic aerial images, these areas are inundated or partially inundated when the water level in the lake is higher.

Southern black willow forest/riparian herb is generally consistent with the *Xanthium strumarium* association mixed with the *Salix gooddingii* association in *A Manual of California Vegetation* (CNPS 2024). While the *Salix gooddingii* association is considered a sensitive natural community by CDFW (2025b), these areas would not be considered a sensitive natural community due to the extremely low tree cover.

3.2.19 Coast Live Oak Woodland (8.1)

Coast live oak woodland occurs scattered throughout the BSA. This vegetation type is dominated by coast live oak. In some areas, the understory consists of lemonade berry,

toyon, laurel sumac, and California sagebrush while in other areas understory is primarily non-native grasses, miner's-lettuce, and chilicothe. At its margins, coast live oak intergrades with sagebrush scrub, toyon – sumac chaparral, and annual grassland.

Coast live oak woodland is consistent with the *Quercus agrifolia* association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b).

3.2.20 Western Sycamore (8.x)

Western sycamore trees occur scattered throughout the central portion of the BSA downstream of the dam. Areas mapped as western sycamore consists of individual trees and small groups of western sycamore trees in a savannah-like setting. The understory consists of non-native grasses.

Western sycamore is similar to the *Platanus racemosa*/annual grass association in *A Manual of California Vegetation* (CNPS 2024). This association is considered a sensitive natural community by CDFW (2025b).

3.2.21 Cliff (10.0)

Cliffs occur on the western side of Santiago Creek downstream of the dam and along the slopes of Irvine Lake in the western portion of the BSA. This landcover consists of a steep, bare rock face with little to no vegetation.

3.2.22 Open Water (12.1)

Open water occurs in Irvine Lake. Areas mapped as open water were inundated at the time of the survey and unvegetated.

3.2.23 Fluctuating Shoreline (12.2)

Fluctuating shoreline is distributed along the margins of Irvine Lake above the waterline and where the water level has recently receded at the upstream end of the lake. These areas are submerged frequently enough that vegetation has not established. Based on historic aerial images, these areas are inundated or partially inundated when the water level in the lake is higher. These areas fluctuate between open water, unvegetated shoreline, and/or partially vegetated depending on water level.

3.2.24 Vegetated Fluctuating Shoreline (12.2)

Vegetated fluctuating shoreline is distributed along portions of Irvine Lake where the water level has receded long enough for vegetation to become established. These areas are dominated by the non-native swamp prickly grass (*Crypsis schoenoides*) with lesser amounts of flatsedge, seaside healiotrope (*Heliotropium curassavicum* var. *oculatum*), willow weed (*Persicaria lapathifolia*), alkali-mallow, and Bertero's burhead (*Echinodorus berteroi*). Based on historic aerial images, these areas are inundated or are partially inundated when the water level in the lake is higher.

Vegetated fluctuating shoreline is consistent with the *Crypsis* (*C. schoenoides, C. vaginiflora*) association in *A Manual of California Vegetation* (CNPS 2024). This association is not considered a sensitive natural community by CDFW (2025b).

3.2.25 Perennial Stream (13.1)

Perennial stream is located along Santiago Creek upstream of Irvine Lake. It includes a low flow channel and lower portions of the active floodplain; this area broadens as it discharges into Irvine Lake. The low flow channel was primarily unvegetated and flowing water was present at the time of the site visit. The upstream portion of the channel contains seedlings and low-growing vegetation, indicating that it is periodically scoured. Vegetation includes mule fat seedlings (approximately 6 inches high), marsh pulicaria (*Pulicaria paludosa*), white lamb cudweed (*Pseudognaphalium luteoalbum*), fringed willowherb (*Epilobium ciliatum*), willow weed, white sweetclover, annual beard grass (*Polypogon monspeliensis*), southern cattail (*Typha domingensis*), and broad-leaved cattail.

Because of the dynamic nature of this portion of Santiago Creek and the limited amount of vegetation, it does not represent a vegetation association in *A Manual of California Vegetation* (CNPS 2024).

3.2.26 Ornamental (15.5)

Ornamental vegetation is primarily located in association with development and consists of species planted for landscaping purposes. This vegetation type consists of non-native tree species (i.e., pepper tree [*Schinus* sp.], European olive (*Olea europaea*), and gum tree [*Eucalyptus* spp.]), sometimes intermixed with planted native trees such as coast live oak, western sycamore, and Fremont cottonwood. In some areas, the understory is dominated by turf grass.

Ornamental vegetation is consistent with the *Eucalyptus* (*globulus*, *camaldulensis*) association and the *Schinus molle* association in *A Manual of California Vegetation* (CNPS 2024). It is not considered a sensitive natural community by CDFW (2025b).

3.2.27 Developed (15.6)

Developed areas consist of an impermeable landcover and include the dam embankment, spillway channel, buildings, parking lots, and paved roads. These areas are unvegetated.

3.2.28 Disturbed (16.1)

Disturbed areas occur throughout the BSA and consist of bare ground (e.g., graded access roads). Note that graded areas overgrown with vegetation were mapped according to the vegetation. Smaller access roads were not mapped separately from the surrounding vegetation.

3.3 WILDLIFE POPULATIONS AND MOVEMENT PATTERNS

Vegetation in the BSA provides habitat for many wildlife species. Common wildlife species observed or expected to occur in the BSA are discussed below.

3.3.1 Fish

Irvine Lake is stocked with fish, including rainbow trout (*Oncorhynchus mykiss*), bass (*Morone* sp.), catfish (*Ictalurus* sp.), common carp (*Cyprinus carpio*), bluegill (*Lepomis macrochirus*), and crappie (*Pomoxis* sp.). Non-native fish are predators on native species; no native fish (with the exception of the stocked rainbow trout) are expected to occur in Irvine Lake.

3.3.2 Amphibians

Amphibians require moisture for at least a portion of their life cycle, and many require standing or flowing water for reproduction. Terrestrial species may or may not require standing water for reproduction; they survive in dry areas by aestivating (i.e., remaining beneath the soil in burrows or under logs and leaf litter and emerging only when temperatures are low and humidity is high). Many of these species' habitats are associated with water, and they emerge to breed once the rainy season begins. Soil moisture conditions can remain high throughout the year in some habitat types, depending on factors such as amount of vegetation cover, elevation, and slope/aspect.

Amphibian species observed in the BSA include western toad (*Anaxyrus boreas*), California treefrog (*Pseudacris cadaverina*), Baja California treefrog (*Pseudacris hypochondriaca*), and the non-native American bullfrog (*Lithobates catesbeianus*). Other amphibian species expected to occur include garden slender salamander (*Batrachoseps major major*), black-bellied salamander (*Batrachoseps nigriventris*), and arboreal salamander (*Aneides lugubris*).

3.3.3 Reptiles

Reptiles are well-adapted to life in arid habitats. They have several physiological adaptations that allow them to conserve water. Reptiles can also become dormant during weather extremes, allowing them to survive prolonged droughts and paucity of food (Ruben and Hillenius 2005). Reptilian diversity and abundance typically vary with vegetation type and character.

Common reptile species observed in the BSA include common side-blotched lizard (*Uta stansburiana*) and western fence lizard (*Sceloporus occidentalis*). Other reptile species expected to occur include southern alligator lizard (*Elgaria multicarinata*), western skink (*Plestiodon skiltonianus*), red racer (*Coluber flagellum piceus*), California striped racer (*Coluber lateralis lateralis*), California kingsnake (*Lampropeltis californiae*), gopher snake (*Pituophis catenifer*), northern three-lined boa [rosy boa] (*Lichanura orcutti*), and southern Pacific rattlesnake (*Crotalus oreganus helleri*).

3.3.4 Birds

A variety of bird species are expected to be residents in the BSA, using the habitats throughout the year. Other species are present only during certain seasons. For example, the white-crowned sparrow (*Zonotrichia leucophrys*) is expected to occur in the BSA during the winter and migrate to the northern forests for breeding in the spring.

The following resident bird species were observed in the BSA: mallard (*Anas platyrhynchos*), California quail (*Callipepla californica*), mourning dove (*Zenaida macroura*), Anna's hummingbird (*Calypte anna*), double-crested cormorant (*Phalacrocorax auritus*), snowy egret (*Egretta thula*), acorn woodpecker (*Melanerpes formicivorus*), northern flicker (*Colaptes auratus*), black phoebe (*Sayornis nigricans*), Say's phoebe (*Sayornis saya*), California scrub jay (*Aphelocoma californica*), American crow (*Corvus brachyrhynchos*), common raven (*Corvus corax*), oak titmouse (*Baeolophus inornatus*), Bewick's wren (*Thryomanes bewickii*), blue-gray gnatcatcher (*Polioptila caerulea*), northern mockingbird (*Mimus polyglottos*), European starling (*Sturnus vulgaris*), house finch (*Haemorhous mexicanus*), lesser goldfinch (*Spinus psaltria*), California towhee (*Melozone crissalis*), song sparrow (*Melospiza melodia*), and common yellowthroat (*Geothlypis trichas*).

Migratory species observed in the BSA that are present during the nesting season include lesser nighthawk (*Chordeiles acutipennis*), barn swallow (*Hirundo rustica*), and black-headed grosbeak (*Pheucticus melanocephalus*). Other migratory species that would be expected to occur in the spring/summer include black-chinned hummingbird (*Archilochus alexandri*), Pacific-slope flycatcher (*Empidonax difficilis*), ash-throated flycatcher (*Myiarchus cinerascens*), phainopepla (*Phainopepla nitens*), hooded oriole (*Icterus cucullatus*), and Bullock's oriole (*Icterus bullockii*). Wintering species observed or expected to occur in the BSA include ruby-crowned kinglet (*Regulus calendula*), cedar waxwing (*Bombycilla cedrorum*), yellow-rumped warbler (*Setophaga coronata*), Townsend's warbler (*Setophaga townsendi*), and white-crowned sparrow.

Raptors (birds of prey) observed or expected to occur in the BSA include Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), great-horned owl (*Bubo virginianus*), barn owl (*Tyto alba*), western screech owl (*Megascops kennicottii*), and American kestrel (*Falco sparverius*). The turkey vulture (*Cathartes aura*), a scavenger, was also observed. Each of these species also has potential to nest in the BSA.

3.3.5 Mammals

Small mammals observed in the BSA include Eastern fox squirrel (*Sciurus niger*), California ground squirrel (*Otospermophilus beecheyi*), Botta's pocket gopher (*Thomomys bottae*), mouse (*Peromyscus sp.*), and desert cottontail (*Sylvilagus audubonii*). Medium to large-sized mammals, or their sign, observed include mountain lion (*Puma concolor*), coyote (*Canis latrans*), northern raccoon (*Procyon lotor*), and southern mule deer (*Odocoileus hemionus*).

Bats occur throughout most of Southern California and may use any portion of the BSA as foraging habitat. Most of the bats that could potentially occur in the BSA are inactive during the winter and either hibernate or migrate, depending on the species. Bats may roost in cliffs

or rocky outcroppings, crevices of structures, or large oak or sycamore trees in the BSA. Bat species that may occur in the BSA for foraging and roosting include greater bonneted bat [western mastiff bat] (*Eumops perotis californicus),* Brazilian free-tailed bat (*Tadarida brasiliensis*), big brown bat (*Eptesicus fuscus*), canyon bat (*Parastrellus hesperus*), pallid bat (*Antrozous pallidus*), California myotis (*Myotis californicus*), and Yuma bat (*Myotis yumanensis*).

3.3.6 Wildlife Movement

Wildlife corridors link together areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated "islands" of wildlife habitat. In the absence of habitat linkages that allow movement to adjoining open space areas, various studies have concluded that some wildlife species, especially the larger and more mobile mammals, will not likely persist over time in fragmented or isolated habitat areas because they prohibit the infusion of new individuals and genetic information (MacArthur and Wilson 1967; Soule 1987; Harris and Gallagher 1989; Bennett 1990). Corridors mitigate the effects of this fragmentation by (1) allowing animals to move between remaining habitats, thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk that catastrophic events (such as fire or disease) will result in population or local species extinction; and (3) serving as travel routes for individual animals as they move in their home ranges in search of food, water, mates, and other necessary resources (Noss 1983; Farhig and Merriam 1985; Simberloff and Cox 1987; Harris and Gallagher 1989).

Wildlife movement activities usually fall into one of three movement categories: (1) dispersal (e.g., juvenile animals from natal areas or individuals extending range distributions); (2) seasonal migration; and (3) movements related to home range activities (e.g., foraging for food or water; defending territories; or searching for mates, breeding areas, or cover). A number of terms such as "wildlife corridor," "travel route," "habitat linkage," and "wildlife crossing" have been used in various wildlife movement studies to refer to areas in which wildlife move from one area to another. To clarify the meaning of these terms and to facilitate the discussion on wildlife movement in this analysis, these terms are defined as follows:

A. ***Travel route –*** a landscape feature (such as a ridgeline, drainage, canyon, or riparian strip) within a larger natural habitat area that is used frequently by animals to facilitate movement and to provide access to necessary resources (e.g., water, food, cover, den sites). The travel route is generally preferred because it provides the least amount of topographic resistance in moving from one area to another. It contains adequate food, water, and/or cover while moving between habitat areas; and it provides a relatively direct link between target habitat areas.

B. ***Wildlife corridor –*** a piece of habitat, usually linear in nature, that connects two or more habitat patches that would otherwise be fragmented or isolated from one another. Wildlife corridors are usually bound by urban land areas or other areas unsuitable for wildlife. The corridor generally contains suitable cover, food, and/or

water to support species and to facilitate their movement while in the corridor. Larger, landscape-level corridors (often referred to as "habitat linkages" or "landscape linkages") can provide both transitory and resident habitat for a variety of species.

C. ***Wildlife crossing*** **–** a small, narrow area, relatively short in length and generally constricted in nature that allows wildlife to pass under or through an obstacle or barrier that otherwise hinders or prevents movement. Crossings typically are man-made and include culverts, underpasses, drainage pipes, and tunnels to provide access across or under roads, highways, pipelines, or other physical obstacles. These often represent "choke points" along a movement corridor, which may impede wildlife movement and increase the risk of predation.

It is important to note that in a large, open space area with few or no man-made or naturally occurring physical constraints to wildlife movement, wildlife corridors (as defined above) may not yet exist. Given an open space area that is both large enough to maintain viable populations of species and to provide a variety of travel routes (e.g., canyons, ridgelines, trails, riverbeds, and others), wildlife will use these "local" routes while searching for food, water, shelter, and mates and will not need to cross into other large, open space areas. Based on their size, location, vegetative composition, and availability of food, some of these movement areas (e.g., large drainages and canyons) are used for longer lengths of time and serve as source areas for food, water, and cover, particularly for small- and medium-sized animals. This is especially true if the travel route is within a larger open space area. However, once open space areas become constrained and/or fragmented as a result of urban development or construction of physical obstacles (such as roads and highways), the remaining landscape features or travel routes that connect the larger open space areas become corridors as long as they provide adequate space, cover, food, and water and do not contain obstacles or distractions (e.g., man-made noise, lighting) that would generally hinder wildlife movement.

In general, wildlife corridor discussions typically focus on larger, more mobile mammal species such as southern mule deer, mountain lion, and coyote. Discussing the needs of larger mammal species typically also captures the needs of mid-sized mammals such as foxes (*Vulpes* sp.), northern raccoon, striped skunk (*Mephitis mephitis*), and American badger (*Taxidea taxus*). Most mammal species have relatively large home ranges through which they move to find adequate food, water, and breeding and wintering habitat. It is assumed that corridors that serve larger, more mobile mammal species also serve as corridors for many smaller, less mobile species, such as reptiles, amphibians, and rodents. Regional movement for these species facilitates gene flow and requires at least some local "stepping stone" movement of individuals between populations.

Discussions of wildlife corridors generally focus less on bird species because they are more mobile and can fly over inhospitable habitat. Long-distance migrants are able to move great distances over unsuitable habitat; however, they must have stopover sites to rest and forage in order to continue their migration. Many resident species are habitat-specific, moving only through their preferred habitat type(s), or similar adjacent habitat; wildlife corridors would be more important for these bird species.

Ideally, an open space corridor should encompass a heterogeneous mix of vegetation types to accommodate the ecological requirements of a wide variety of resident species in any particular region. Most species typically prefer adequate vegetation cover during movement, which can serve as both a food source and as protection from weather and predators. Drainages, riparian areas, and forested canyon bottoms typically serve as natural movement corridors because these features provide cover, food, and often water for a variety of species. Very few species will move across large expanses of open, uncovered habitat unless it is the only option available to them. Landscape linkages must also provide "live-in" habitat (food and cover) to support smaller and less mobile species, such as amphibians, reptiles, and rodents, that require longer periods to traverse a corridor.

The BSA is contiguous with large undeveloped open space areas in the NCCP Reserve, OC Regional Parks, and the Cleveland National Forest. Due to the undeveloped nature of the BSA, wildlife movement is generally unconstrained in and around the BSA. Santiago Creek likely functions as a regional movement corridor and connects with several canyons both upstream and downstream of the BSA. The existing dam structure and associated reservoir may be a barrier to movement for amphibians, reptiles, and small mammals moving along the drainage; however, like larger mammals, these small animals can move around the lake and dam over time using the adjacent drainages and ridgelines as travel routes. Santiago Canyon Road to the south of the BSA may be a barrier to wildlife movement for small animals; however, small animals could use drainage structures under the road as wildlife crossings. The roadway would not be expected to be a barrier to movement for medium and large-sized mammals due to the relatively low level of traffic on the road; the medium and large-sized mammals would be expected to cross over the roadway when traffic is low.

A NCCP "Special Linkage" area occurs in the southern portion of the BSA, extending southeast along Santiago Canyon Road (Exhibit 4). It connects Habitat Reserve areas to the west and north of Irvine Lake to Habitat Reserve areas south of Santiago Canyon Road (i.e., Limestone Canyon). Special Linkages include areas where proposed development or existing uses would provide either an opportunity to conserve habitat useful for biological connectivity or support target species while permitting compatible non-habitat uses. Special Linkages are not part of the Reserve System. Existing uses within the Special Linkage in the BSA include development associated with Irvine Lake and Santiago Canyon Road.

3.4 SPECIAL STATUS BIOLOGICAL RESOURCES

The following section addresses special status biological resources that were observed, reported, or have the potential to occur in the BSA. These resources include plant and wildlife species that have been afforded special status and/or recognition by federal and State resource agencies, as well as private conservation organizations. In general, the principal reason an individual taxon (i.e., species, subspecies, or variety) is given such recognition is the documented or perceived decline or limitations of its population size, geographic range, and/or distribution resulting in most cases from habitat loss. In addition to species, special status biological resources include vegetation types and habitats that are either unique; of relatively limited distribution in the region; or provide a high value for wildlife. These resources have been defined by federal, State, and local government conservation programs. Sources used to determine the special status of biological resources are listed below.

- ***Habitats* –** the CNDDB (CDFW 2025a); *NatureServe Conservation Status Assessments: Methodology for Assigning Ranks* (Faber-Langendoen et al. 2012); and the *California Natural Communities List* (CDFW 2025b).
- ***Plants* –** the CNDDB (CDFW 2025a); the Inventory of Rare and Endangered Plants (CNPS 2025); various USFWS *Federal Register* notices regarding listing status of plant species; and the *List of Special Vascular Plants, Bryophytes, and Lichens* (CDFW 2025c).
- ***Wildlife* –** the CNDDB (CDFW 2025a); the California Wildlife Habitat Relationships Database System (CDFW 2014); various USFWS *Federal Register* notices regarding listing status of wildlife species; and the *List of Special Animals* (CDFW 2025d).

3.4.1 Definitions

A federally **Endangered** species is one facing extinction throughout all or a significant portion of its geographic range. A federally **Threatened** species is one likely to become Endangered within the foreseeable future throughout all or a significant portion of its range. The presence of any federally listed Threatened or Endangered species in a project impact area generally imposes constraints on development, particularly if development would result in "take" of the species or its habitat. The term "take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct. "Harm" in this sense can include any disturbance of species' habitats during any portion of its life history.

Federally **Proposed** or **Candidate** species are those officially proposed by the USFWS to be added to the federal Threatened and Endangered species list. Because proposed species may soon be listed as Threatened or Endangered, these species could become listed prior to or during implementation of a proposed project. The presence of a Proposed or Candidate species within a project impact area may impose constraints on development if they are listed prior to issuance of project permits, particularly if a project would result in "take" of the species or its habitat.

The State of California considers an **Endangered** species to be one whose prospects of survival and reproduction are in immediate jeopardy, a **Threatened** species as one present in such small numbers throughout its range that it is likely to become an Endangered species in the near future in the absence of special protection or management, and a **Rare** species as one present in such small numbers throughout its range that it may become Endangered if its present environment worsens. "Rare species" only applies only to California native plants. State-listed Threatened and Endangered species are protected against take unless an Incidental Take Permit is obtained from the resource agencies. The presence of any State-listed Threatened or Endangered species in a project impact area generally imposes constraints on development, particularly if a project would result in "take" of the species or its habitat.

California **Species of Special Concern** is an informal designation used by CDFW for some declining wildlife species that are not State Candidates for listing. This designation does not provide legal protection but signifies that these species are recognized as special status by CDFW. A few years ago, CDFW down-listed several species from Species of Special Concern

to the **Watch List**. Although not considered special status, Watch List species are tracked by the CNDDB.

Species that are California **Fully Protected** and **Protected** include those protected by special legislation for various reasons, such as the mountain lion and white-tailed kite (*Elanus leucurus*). Fully Protected species may not be taken or possessed at any time. California Protected species include those species that may not be taken or possessed at any time except under special permit from CDFW issued pursuant to Sections 650 and 670.7 of the *California Code of Regulations,* or Section 2081 of the *California Fish and Game Code.*

Species of **Local Concern** are those that have no official status with the resource agencies but are being watched because either the region has a unique population or the species is declining in the region.

Special Animal is a general term that refers to species that the CNDDB is interested in tracking, regardless of legal or protective status. This term includes species designated as any of the above terms but also includes species that may be considered biologically rare; restricted in distribution; declining throughout their range; have a critical, vulnerable stage in their life cycle that warrants monitoring; are on the periphery of their range and are threatened with extirpation in California; are associated with special status habitats; or are considered by other State or federal agencies or private organizations to be sensitive or declining.

The **CRPR**, formerly known as CNPS List, is a ranking system by the Rare Plant Status Review group[11] and managed by the CNPS and CDFW (CDFW 2025). A CRPR summarizes information on the distribution, rarity, and endangerment of California's vascular plants. Plants with a CRPR of **1A** are presumed extirpated from the state because they have not been seen in the wild in California for many years and they are either rare or extinct elsewhere. Plants with a CRPR of **1B** are Rare, Threatened, or Endangered throughout their range. Plants with a CRPR of **2A** are presumed extirpated from California but are more common elsewhere. Plants with a CRPR of **2B** are considered Rare, Threatened, or Endangered in California, but are more common elsewhere. Plants with a CRPR of **3** require more information before they can be assigned to another rank or rejected; this is a "review" list. Plants with a CRPR of **4** are of limited distribution or are infrequent throughout a broader area in California; this is a "watch list". The Threat Rank is an extension that is added to the CRPR to designate the plant's endangerment level. An extension of **.1** is assigned to plants that are considered to be "seriously threatened" in California (i.e., over 80 percent of the occurrences are threatened or have a high degree and immediacy of threat). Extension **.2** indicates the plant is "fairly threatened" in California (i.e., between 20 and 80 percent of the occurrences are threatened or have a moderate degree and immediacy of threat). Extension **.3** is assigned to plants that are considered "not very threatened" in California (i.e., less than 20 percent of occurrences are threatened or have a low degree and immediacy of threat or no current threats are known). The absence of a threat code extension indicates that this information is lacking for the plant(s) in question.

[11] This group consists of over 300 botanical experts from the government, academia, non-governmental organizations, and the private sector.

In addition to providing an inventory of special status plant and wildlife species, CDFW also provides an inventory of vegetation types that are considered special status by the State and federal resource agencies, academic institutions, and various conservation groups (e.g., the CNPS). Special status natural communities are "of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects"; they may or may not contain special status species (CDFG 2009). Determination of the level of imperilment (i.e., exposure to injury, loss, or destruction) is based on the NatureServe Heritage Program Status Ranks that rank both species and vegetation types on a global and statewide basis according to their rarity, trend in population size or area, and recognized threats (e.g., proposed developments, habitat degradation, and non-native species invasion) (Faber-Langendoen et al. 2012).

3.5 SPECIAL STATUS VEGETATION TYPES

Coastal sage scrub vegetation (i.e., sagebrush scrub, disturbed sagebrush scrub, sagebrush – coyote brush scrub, southern cactus scrub, disturbed southern cactus scrub and disturbed floodplain sage scrub) is considered a special status vegetation type in the Central–Coastal NCCP/HCP area because of its potential to support NCCP/HCP Covered Species. Additionally, southern cactus scrub and disturbed southern cactus scrub are considered sensitive natural communities by CDFW (2025b; Table 12).

Riparian vegetation types are often considered special status because they are often under the regulatory authority of the resource agencies (i.e., USACE, CDFW, and RWQCB); jurisdictional resources are discussed in the next section. Riparian vegetation types in the BSA include riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern black willow forest, disturbed southern black willow forest, and southern black willow forest/riparian herb. Other mapped areas that may be considered riparian and jurisdictional resources include open water, fluctuating shoreline, vegetated fluctuating shoreline, and perennial stream. Of these riparian vegetation types, southern willow scrub, southern black willow forest, and disturbed southern black willow forest are considered sensitive natural communities by CDFW (2025b; Table 12).

Sycamore and oak woodlands provide high quality habitat for wildlife. These trees are large enough to provide cavities for shelter (e.g., roosting) and breeding (e.g., cavity-nesting) for wildlife species. Downed wood provides important cover for amphibians, reptiles, and small to medium-sized mammals; nest sites for cavity-nesting and ground-nesting birds; nutrients into the soil as they decompose; and favorable microhabitat for emerging seedlings (Tietje et al. 2005). Southern sycamore riparian woodland/coast live oak forest and western sycamore are considered sensitive natural communities by CDFW (2025b; Table 12). Coast live oak woodland is not considered a sensitive natural community but is generally considered of local concern because of the habitat value that it provides.

Toyon–sumac chaparral, annual grassland, ruderal, and ornamental are not considered sensitive natural communities by CDFW (2025b). Cliff, disturbed and developed are not given threat rankings because they are unvegetated landcovers.

3.6 JURISDICTIONAL RESOURCES

Seventeen potential jurisdictional features were mapped in the BSA: Irvine Lake, Santiago Creek, and 15 smaller drainages that discharge into either Irvine Lake or Santiago Creek. Based on an assessment of jurisdictional waters, a total of 428.476 acres of WOTUS under the regulatory authority of the USACE, 435.205 acres of waters of the State under the regulatory authority of the RWQCB, and 669.630 acres of waters under the regulatory authority of CDFW occurs in the BSA (Table 13, Exhibits 7, 8, and 9).

TABLE 13
SUMMARY OF JURISDICTIONAL RESOURCES IN THE SURVEY AREA

Feature	Jurisdiction (acres)						
	USACE WOTUS			RWQCB Waters of the State			CDFW Jurisdictional Resources

3.7 SPECIAL STATUS PLANTS

Table 14 provides a summary of special status plant species reported to occur in the Project region (i.e., the USGS' Black Star Canyon, Orange, Tustin, and El Toro 7.5-minute quadrangles). This list includes species reported by the CNDDB and the CNPS, supplemented with species from the Project Biologist's experience that either occur nearby or could occur based on the presence of suitable habitat. The table includes information on the status, NCCP/HCP coverage, species habitat, and potential for occurrence. Note that these species are listed alphabetically according to their scientific name.

Focused surveys for special status plants were conducted downstream of the dam in spring/summer 2020 and upstream of the dam in spring/summer 2022. The potential for occurrence in the area where additional inundation would occur is also shown in Table 14.

Focused surveys were conducted for all special status plant species with potential to occur in the BSA based on the presence of suitable habitat. Three special status plant species, intermediate mariposa lily (*Calochortus weedii* var. *intermedius*), many-stemmed dudleya (*Dudleya multicaulis*), and Coulter's matilija poppy, were observed downstream of the dam during the 2020 focused surveys (Appendix E). Four special status plant species, Braunton's milkvetch (*Astragalus brauntonii*), intermediate mariposa lily, mud nama (*Nama stenocarpa*), and Coulter's matilija poppy, were observed upstream of the dam during the 2022 focused surveys (Appendix E). The five special status species that were observed in the BSA are discussed in more detail following the table. The remaining species would not be expected to occur because the BSA lacks suitable habitat or because they were not observed during the focused surveys.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Abronia villosa var. *aurita*	chaparral sand-verbena	—	—	1B.1	No	Sandy areas in chaparral, coastal scrub, desert dunes.	Not expected to occur; not observed during focused surveys; suitable habitat.
Allium marvinii	Yucaipa onion	—	—	1B.2	No	Dry slopes and ridges in chaparral.	Not expected to occur; outside current known range.
Astragalus brauntonii	Braunton's milk-vetch	FE	—	1B.1	No	Recent burns or disturbed areas, usually on sandstone with carbonate layers in chaparral, coastal scrub, valley and foothill grassland. Reported immediately north of the BSA in 2012 (CDFW 2025a).	**Observed in the survey area**
Atriplex coulteri	Coulter's saltbush	—	—	1B.2	No	Alkaline or clay soils in coastal bluff scrub, coastal dunes, coastal scrub, and valley and foothill grassland.	Not expected to occur; not observed during focused surveys; marginally suitable habitat.
Atriplex pacifica	south coast saltscale	—	—	1B.2	No	Alkaline soils in coastal scrub, coastal bluff scrub, playas, coastal dunes.	Not expected to occur; not observed during focused surveys; marginally suitable habitat.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Atriplex serenana var. *davidsonii*	Davidson's saltscale	—	—	1B.2	No	Alkaline soils in coastal bluff scrub, coastal scrub.	Not expected to occur; not observed during focused surveys; marginally suitable habitat.
Baccharis malibuensis	Malibu baccharis	—	—	1B.1	No	In Conejo volcanic substrates in coastal scrub, chaparral, cismontane woodland, and riparian woodland. Reported immediately north of the BSA in 2000 (CCH 2020).	Not expected to occur; not observed during focused surveys; suitable habitat.
Bahiopsis laciniata	San Diego County viguiera	—	—	4.3	No	Chaparral and coastal scrub	Not expected to occur; not observed during focused surveys; suitable habitat.
Brodiaea filifolia	thread-leaved brodiaea	FT	SE	1B.1	No	Chaparral openings, cismontane woodland, coastal scrub, playas, valley and foothill grassland, vernal pools.	Not expected to occur; not observed during focused surveys; suitable habitat.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Calandrinia breweri	Brewer's calandrinia	—	—	4.2	No	Sandy or loamy soils in disturbed sites and burns in chaparral and coastal sage scrub.	Not expected to occur; not observed during focused surveys; suitable habitat.
Calochortus catalinae	Catalina mariposa lily	—	—	4.2	Covered	Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland.	Not expected to occur; not observed during focused surveys; suitable habitat. Incidentally observed on access road outside survey area.
Calochortus plummerae	Plummer's mariposa-lily	—	—	4.2	No	Rocky and sandy sites, usually of granitic or alluvial material, in coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, lower montane coniferous forest.	Not expected to occur; not observed during focused surveys; suitable habitat.
Calochortus weedii var. *intermedius*	intermediate mariposa-lily	—	—	1B.2	Conditionally Covered	Dry, rocky calcareous slopes and rock outcrops in coastal scrub, chaparral, valley and foothill grassland.	**Observed in the survey area.**

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Camissoniopsis lewisii	Lewis' evening-primrose	—	—	3	No	Sand or clay substrate in coastal bluff scrub, cismontane woodland, coastal dunes, coastal scrub, valley and foothill grassland.	Not expected to occur; not observed during focused surveys; suitable habitat.
Centromadia parryi ssp. *australis*	southern tarplant	—	—	1B.1	No	Disturbed sites and alkaline soils in marshes and swamp margins, valley and foothill grassland, and vernal pools.	Not expected to occur; not observed during focused surveys; suitable habitat.
Chorizanthe parryi var. *fernandina*	San Fernando Valley spineflower	—	SE	1B.1	No	Sandy soils in coastal scrub, valley and foothill grasslands. Historic (1902) occurrence within 0.5 mile of the BSA, but the BSA is outside the current known range of the species (CDFW 2025a).	Not expected to occur; historic (1902) occurrence within 0.5 mile but outside current known range.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Chorizanthe polygonoides var. *longispina*	long-spined spineflower	—	—	1B.2	No	Gabbroic clay or sandy soil in chaparral, coastal scrub, meadows and seeps, valley and foothill grassland, vernal pools. BSA is at the edge of the current known range.	Not expected to occur; not observed during focused surveys; suitable habitat.
Convolvulus simulans	small-flowered morning-glory	—	—	4.2	No	Clay, occasionally serpentine soils in chaparral openings, coastal scrub, valley and foothill grasslands. Reported just west of Irvine Lake in 2016 (CCH 2020).	Not expected to occur; not observed during focused surveys; suitable habitat.
Deinandra paniculata	paniculate tarplant	—	—	4.2	No	Usually vernally mesic, sometimes sandy substrate in coastal scrub, valley and foothill grassland, and vernal pools.	Not expected to occur; not observed during focused surveys; suitable habitat.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Diplacus clevelandii	Cleveland's bush monkeyflower	—	—	4.2	No	Disturbed areas and open borders of chaparral, cismontane woodland, and lower montane coniferous forest.	Not expected to occur; outside current known elevational range.
Dodecahema leptoceras	slender-horned spineflower	FE	SE	1B.1	No	Sandy soil in chaparral, cismontane woodland, and alluvial fan coastal scrub.	Not expected to occur; outside current known range.
Dudleya cymosa ssp. *ovatifolia*	Santa Monica Mountains dudleya	FT	—	1B.1	Covered	Volcanic or sedimentary, rocky sediment in chaparral and coastal scrub.	Not expected to occur; not observed during focused surveys; suitable habitat.
Dudleya multicaulis	many-stemmed dudleya	—	—	1B.2	No	Heavy, often clayey soils or grassy slopes in chaparral, coastal scrub, valley and foothill grassland. Reported in immediate vicinity of the BSA in 2008 (CDFW 2025a).	**Observed in the 2020 plant focused survey area.**

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Eriastrum densifolium ssp. *sanctorum*	Santa Ana River woollystar	FE	SE	1B.1	No	Sandy soils on river floodplains or terraced fluvial deposits in coastal scrub and chaparral.	Not expected to occur; outside current known range (i.e., the Santa Ana River watershed).
Harpagonella palmeri	Palmer's grapplinghook	—	—	4.2	Covered	Clay soils in open grasses areas in chaparral, coastal scrub, and valley and foothill grassland.	Not expected to occur; not observed during focused surveys; suitable habitat.
Helianthus nuttallii ssp. *parishii*	Los Angeles sunflower	—	—	1A	No	Coastal and freshwater marshes and swamps.	Not expected to occur; not observed during focused surveys; presumed extinct; suitable habitat.
Hesperocyparis forbesii	Tecate cypress	—	—	1B.1	Covered	Clay or gabbro soils in closed-cone coniferous forest and chaparral.	Not expected to occur; perennial species not observed during general plant surveys or focused surveys.
Hesperocyparis goveniana	Gowen cypress	FT	—	1B.2	No	Closed-cone coniferous forest, mixed evergreen forest, chaparral, and coastal terraces. Perennial species observable year-round.	Not expected to occur; perennial species not observed during general plant surveys or focused surveys.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Hordeum intercedens	vernal barley	—	—	3.2	No	Coastal dunes, coastal scrub, saline flats and depressions of valley and foothill grassland, vernal pools. Reported just south of Irvine Lake in 1998 (CCH 2020).	Not expected to occur; not observed during focused surveys; marginally suitable habitat.
Horkelia cuneata var. *puberula*	mesa horkelia	—	—	1B.1	No	Sandy or gravelly soils in chaparral, cismontane woodland, and coastal scrub.	Not expected to occur; not observed during focused surveys; suitable habitat.
Juglans californica	Southern California black walnut	—	—	4.2	No	Chaparral, cismontane woodland, coastal scrub, and riparian woodland. Perennial species observable year-round.	Not expected to occur; perennial species not observed during general plant surveys or focused surveys.
Juncus acutus ssp. *leopoldii*	southwestern spiny rush	—	—	4.2	No	Moist, saline places including coastal dunes, marshes and swamps, and meadows and seeps. Perennial species observable year-round.	Not expected to occur; perennial species not observed during focused surveys; marginally suitable habitat.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Lasthenia glabrata ssp. *coulteri*	Coulter's goldfields	—	—	1B.1	No	Usually on alkaline soils in coastal salt marsh, playas, vernal pools. Reported from oak woodland in 2008 (CCH 2020).	Not expected to occur; not observed during focused surveys; no suitable habitat.
Lepechinia cardiophylla	heart-leaved pitcher sage	—	—	1B.2	Covered	Closed-cone coniferous forest, chaparral, cismontane woodland.	Not expected to occur; outside current known elevational range.
Lepidium virginicum var. *robinsonii*	Robinson's pepper-grass	—	—	4.3	No	Dry soils in chaparral and coastal scrub.	Not expected to occur; not observed during focused surveys; suitable habitat.
Lilium humboldtii ssp. *ocellatum*	ocellated Humboldt lily	—	—	4.2	No	Openings in chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and riparian woodland.	Not expected to occur; not observed during focused surveys; suitable habitat.
Lycium californicum	California box-thorn	—	—	4.2	No	Coastal bluff scrub and coastal scrub. Perennial species observable year-round.	Not expected to occur; outside current known range.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Monardella hypoleuca ssp. *intermedia*	intermediate monardella	—	—	1B.3	No	Chaparral, cismontane woodland, and sometimes lower montane coniferous forest.	Not expected to occur; not observed during focused surveys; marginally suitable habitat.
Nama stenocarpa	mud nama	—	—	2B.2	No	Lake shores, riverbanks, intermittently wet areas, marshes, and swamps. BSA is at the edge of the current known range.	**Observed in the survey area.**
Nasturtium gambelii	Gambel's water cress	FE	ST	1B.1	No	Freshwater and brackish marshes at the martins of lakes and along streams; in or just above the water level.	Not expected to occur; not observed during focused surveys; suitable habitat.
Nolina cismontana	chaparral nolina	—	—	1B.2	No	Primarily sandstone and shale substrates in chaparral and coastal scrub.	Not expected to occur; not observed during focused surveys; suitable habitat.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Penstemon californicus	California beardtongue	—	—	1B.2	No	Sandy or granitic soils and stony slopes in chaparral, lower montane coniferous forest, pinyon and juniper woodland.	Not expected to occur; outside current known range.
Pentachaeta aurea ssp. *allenii*	Allen's pentachaeta	—	—	1B.1	No	Openings in coastal scrub and valley and foothill grasslands.	Not expected to occur; not observed during focused surveys; suitable habitat.
Phacelia hubbyi	Hubby's phacelia	—	—	4.2	No	Open gravelly or rocky slopes of chaparral, coastal scrub, and valley and foothill grassland.	Not expected to occur; not observed during focused surveys; suitable habitat.
Pickeringia montana var. *tomentosa*	woolly chaparral-pea	—	—	4.3	No	Gabbroic, granitic, or clay soil in chaparral.	Not expected to occur; no suitable habitat.
Pseudognaphalium leucocephalum	white rabbi-tobacco	—	—	2B.2	No	Sandy, gravelly areas of riparian woodland, cismontane woodland, coastal scrub, and chaparral.	Not expected to occur; not observed during focused surveys; suitable habitat.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Rhinotropis [*Polygala*] *cornuta* var. *fishiae*	Fish's milkwort	—	—	4.3	No	Chaparral, cismontane woodland, riparian woodland.	Not expected to occur; not observed during focused surveys; suitable habitat.
Romneya coulteri	Coulter's matilija poppy	—	—	4.2	Covered	Chaparral and coastal scrub, often in burns.	**Observed in the survey area.**
Senecio aphanactis	chaparral ragwort	—	—	2B.2	No	Drying alkaline flats of chaparral, cismontane woodland, coastal scrub.	Not expected to occur; not observed during focused surveys; marginally suitable habitat.
Sidalcea neomexicana	salt spring checkerbloom	—	—	2B.2	No	Alkali springs and marshes in playas, chaparral, coastal scrub, lower montane coniferous forest, and Mojavean desert scrub.	Not expected to occur; not observed during focused surveys; marginally suitable habitat.
Suaeda esteroa	estuary seablite	—	—	1B.2	No	Coastal salt marshes in clay, silt, and sand substrates.	Not expected to occur; no suitable habitat.
Suaeda taxifolia	woolly seablite	—	—	4.2	No	Coastal bluff scrub, coastal dunes, and salt marshes.	Not expected to occur; outside current known range; no suitable habitat.

TABLE 14
SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
Symphyotrichum defoliatum	San Bernardino aster	—	—	1B.2	No	Disturbed areas, vernally mesic grassland, or near ditches, streams, and springs in meadows and seeps, cismontane woodland, coastal scrub, lower montane coniferous forest, marshes and swamps, valley and foothill grassland.	Not expected to occur; not observed during focused surveys; suitable habitat.
Viguiera laciniata	San Diego County viguiera	—	—	4.3	No	Chaparral and coastal scrub.	Not expected to occur; not observed during focused surveys; suitable habitat.

SPECIAL STATUS PLANT SPECIES REPORTED FROM THE PROJECT REGION

Species	Common Name	Federal Status	State Status	CRPR	NCCP/ HCP Covered Species	Habitat*	Potential to Occur
CRPR Threat Code Extensions None Plants lacking any threat information .1 Seriously threatened in California (over 80% of occurrences threatened; high degree and immediacy of threat) .2 Fairly threatened in California (20–80% of occurrences threatened; moderate degree and immediacy of threat) .3 Not very threatened in California (<20% of occurrences threatened; low degree and immediacy of threat or no current threats known) Species that were observed on site are shown in **boldface type.** * Sources include CDFW 2025a, CNPS 2025, and Jepson Flora Project 2024.							

3.7.1 Braunton's Milkvetch

Braunton's milkvetch is a federally listed Endangered species and has a CRPR of 1B.1. It is not a Covered species in the Central Coastal NCCP/HCP. It typically blooms between January and August (CNPS 2025). This perennial herb occurs in chaparral, coastal scrub, and valley and foothill grassland at elevations between approximately 15 and 2,100 feet above msl (Jepson Flora Project 2024; CNPS 2025). It generally occurs after recent burns or in disturbed areas, usually in sandstone with carbonate layers (CNPS 2025). This species is known from the western portion of the Western Transverse Ranges, the San Gabriel Mountains, tentatively from the San Gabriel Mountains/South Coast, and the northern Peninsular Ranges (Jepson Flora Project 2024); it is known from a few canyons in Orange County (Allen and Roberts 2013).

One individual Braunton's milkvetch was observed in the 2022 survey area (Psomas 2022a; Exhibit 10). It was observed in the sandy channel of Santiago Creek, upstream of the lake. The species associated with the Braunton's milkvetch observed in the survey area include mule fat, cicuta-leaved phacelia (*Phacelia cicutaria*), and horseweed (*Erigeron canadensis*). A voucher specimen was not collected due to the limited population size.

3.7.2 Intermediate Mariposa Lily

Intermediate mariposa lily has a CRPR of 1B.2. It is a Conditionally Covered species[12] in the Central–Coastal NCCP/HCP (i.e., populations less than 20 individuals are fully authorized). It typically blooms between May and July (Jepson Flora Project 2024; CNPS 2025). This perennial bulbiferous herb occurs on dry, rocky, open slopes in chaparral and coastal sage scrub at elevations between sea level and approximately 2,231 feet above msl (Roberts 2008; Jepson Flora Project 2024). It is sometimes locally common following fire (Roberts 2008). This species is known from the South Coast and northern Peninsular Ranges (Jepson Flora Project 2024).

One individual intermediate mariposa lily was observed in the 2020 focused survey area (Psomas 2020d, Exhibit 10). This individual was observed in the eastern portion of the 2020 focused survey area on a moderately steep, south facing slope in disturbed sagebrush scrub with Ceineba-rock outcrop complex soil. The species associated with the intermediate mariposa lily observed include California sagebrush, black mustard, coast morning glory (*Calystegia macrostegia*), and oats.

Four individual intermediate mariposa lilies were observed in the 2022 focused survey area and an additional individual was observed just outside the survey area (Psomas 2022a; Exhibit 10). The four individuals were observed in two populations in the northwestern portion of the 2022 survey area on moderately steep, southeast- to east-facing slopes in sagebrush scrub. The species associated with the intermediate mariposa lilies observed in the survey area include California sagebrush, black sage (*Salvia mellifera*), chilicothe, mule fat, California encelia (*Encelia californica*), and smilo grass (*Stipa miliacea* var. *miliacea*).

[12] The NCCP/HCP refers to this species by its former common name – foothill mariposa lily.

3.7.3 Many-stemmed Dudleya

Many-stemmed dudleya has a CRPR of 1B.2. It is not covered by the Central–Coastal NCCP/HCP. It typically blooms between April and June (Jepson Flora Project 2024; CNPS 2025). This perennial herb occurs on heavy, often clayey soils or grassy slopes in chaparral, coastal scrub, valley, and foothill grassland at elevations between approximately 5 and 2,975 feet above msl (Roberts 2008; Jepson Flora Project 2024). This species is known from the South Coast (Jepson Flora Project 2024).

Approximately 810 many-stemmed dudleya individuals were observed in 2 locations in the 2020 focused survey area (Psomas 2020d, Exhibit 10). Approximately 800 individuals were observed in the eastern portion of the 2020 focused survey area and 10 individuals were observed on a steep, east-facing cliff in the western portion of the 2020 focused survey area. The majority of individuals (eastern location) were observed in disturbed sagebrush scrub with Ceineba-rock outcrop complex and pits soil. The smaller population (western location) was observed in toyon-sumac chaparral with Sorrento loam soil. The species associated with the many-stemmed dudleya included California sagebrush, California buckwheat, daggerleaf cottonrose (*Filago gallica*), white sage, splendid mariposa lily (*Calochortus splendens*), common goldfields (*Lasthenia gracillis*), osmadenia (*Osmadenia tenella*), and little California melica (*Melica imperfecta*).

3.7.4 Mud Nama

Mud nama has a CRPR of 2B.2. It is not a Covered species in the Central Coastal NCCP/HCP. It typically blooms between January and October (Jepson Flora Project 2024; CNPS 2025). This annual herb occurs in intermittently wet areas of marshes and swamps, including lake margins and riverbanks at elevations between approximately 15 and 1,640 feet above msl (Jepson Flora Project 2024; CNPS 2025). This species is known from the San Joaquin Valley, South Coast, southern Channel Islands, western Peninsular Ranges, and southeastern Sonoran Desert (Jepson Flora Project 2024). The CNDDB contains 22 records of this species in Imperial, Kings, Los Angeles, Orange, Riverside, and San Diego Counties. Of these, seven locations are reported from Orange County (i.e., Anaheim Marsh [historic occurrence, 1932], Laguna Lakes in Laguna Canyon, Emerald Canyon, Lambert Reservoir, Peters Canyon Channel, Fairview Park, and Ladera Ranch); all the records are over 25 years old. Of these records, the largest reported population was 30 individuals, most other records did not include a count or reported less than 10 individuals (CDFW 2025a).

Multiple populations of mud nama were observed in the southern portion of Irvine Lake in the 2022 focused survey area (Psomas 2022a; Exhibit 10). This area experiences periodic inundation and was mapped as open water during the 2020 vegetation mapping upstream of the dam. At the time of the special status plant survey, the substrate was exposed and consisted of riparian herb vegetation; the species was growing in more open areas, including along disturbed roads/trails. The species associated with the mud nama observed in the survey area were primarily annual beard grass, white sweetclover, and sourclover (*Melilotus indicus*) with scattered saltcedar, alkali heliotrope, mule fat, flatsedge, everlasting (*Pseudognaphalium* sp.), water cress (*Nasturtium officinale*), and willow weed.

Individuals covered a large area and the species is small in stature. To estimate the population sizes, ten quadrats one-square-foot in size were sampled in a relatively dense population of mud nama. This resulted in an average of 37.7 individuals per square foot. Therefore, a "high density" population was considered to have between 35 and 40 individuals per square foot. A "moderate density" population was considered to have between 20 and 25 individuals per square foot and a "low density" population was considered to have between 5 and 10 individuals per square foot. Based on these approximate population densities, the total number of individuals in the survey area was estimated using the square footage of each population. The total population was estimated to be between 3.5 and 5.5 million (Table 15). This is the largest population currently known for this species.

TABLE 15
MUD NAMA POPULATION INFORMATION

Population Number	Estimated Population Density	Population Area (square feet)	Estimated Population Size (Number of Individuals)
1	High density	25,023	875,805 – 1,000,920
2	Moderate density	15,709	314,180 – 392,725
3*	n/a	n/a	100
4*	n/a	n/a	1,000
5	Low density	284,500	1,422,500 – 2,845,000
6	Low density	12,647	63,235 – 126,470
7	Low density	1,121	5,605 – 11,210
8	High density	1,036	36,260 – 41,440
9	Low density	3,053	15,265 – 30,530
10	Low density	9,367	46,835 – 93,670
11	High density	17,305	605,675 – 692,200
12	Low density	8,335	41,675 – 83,350
		Total	**3,428,135 – 5,318,615**

High Density: 35–40 individuals per square foot; Moderate Density: 20–25 individuals per square foot; Low Density: 5–10 individuals per square foot

*Populations 3 and 4 were small and population sizes were estimated directly.

3.7.5 Coulter's Matilija Poppy

Coulter's matilija poppy has a CRPR of 4.2. It is a Covered Species in the Central–Coastal NCCP/HCP. It typically blooms between March and July (Jepson Flora Project 2024; CNPS 2025). This perennial rhizomatous herb occurs in chaparral and coastal scrub, often in elevations between sea level and approximately 3,937 feet above msl (Roberts 2008; Jepson Flora Project 2024). This species grows as clones via rhizomes (Clarke et al. 2007; Jepson Flora Project 2024). This species is known from the South Coast, Western Transverse and Peninsular Ranges, and San Jacinto Mountains (Jepson Flora Project 2024).

Approximately 46 Coulter's matilija poppy clones were observed in 3 populations in the 2020 focused survey area (Psomas 2020d, Exhibit 10). Coulter's matilija poppy clones were observed in the northern and central portions of the 2020 focused survey area. The clones were observed in sagebrush scrub, coast live oak woodland, and toyon–sumac chaparral with Sorrento loam soil. The species associated with the Coulter's matilija poppy include laurel sumac, blue elderberry, California sagebrush, grayish shortpod mustard, chilicothe, black sage (*Salvia melifera*), California buckwheat, coast live oak, long-flowered monkey flower (*Diplicus longiflorus*), and slender wild oat. A voucher specimen was not collected and a CNDDB form was not submitted because this species is not tracked by the CNDDB (i.e., has a CRPR of 4.2).

One individual Coulter's matilija poppy was observed in the 2022 focused survey area (Psomas 2022a; Exhibit 10). It was observed in a sandy/cobbly low terrace of Santiago Creek upstream of the lake. The species associated with the Coulter's matilija poppy observed in the survey area include mule fat, leafy California buckwheat, fennel, and tocalote. A voucher specimen was not collected due to the limited population size and because it is known from the vicinity.

3.8 SPECIAL STATUS WILDLIFE

Table 16 provides a summary of special status wildlife species reported to occur in the Project region (i.e., the USGS' Black Star Canyon, Orange, Tustin, and El Toro 7.5-minute quadrangles). This list includes species reported by the CNDDB, supplemented with species from the Project Biologist's experience that either occur nearby or could occur based on the presence of suitable habitat. This table includes information on the status, NCCP/HCP coverage, species habitat, and potential for occurrence. Note that these species are listed taxonomically. Species observed in the BSA are discussed further below. Exhibit 10 shows the locations of special status species.

Focused surveys for arroyo toad, coastal California gnatcatcher, and least Bell's vireo were conducted downstream of the dam in spring/summer 2020 (Appendices H, J, and K). Focused surveys for Quino checkerspot butterfly were conducted throughout the BSA in spring 2022 (Appendix F). Focused surveys for arroyo toad, coastal California gnatcatcher, least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo were conducted upstream of the dam in spring/summer 2022 (Appendices H, J, K, and L). Focused surveys for Crotch's bumble bee and southwestern pond turtle were conducted throughout the BSA in summer 2024 (Appendices G and I).

Of the 60 species reported from the Project region, 40 species have potential to occur in the BSA based on the presence of suitable habitat and the results of focused surveys. The remaining species would not be expected to occur because the BSA lacks suitable habitat or because they were not observed during the focused surveys. Sixteen special status wildlife species were observed during the 2020, 2022, and 2024 focused surveys; these species are discussed in more detail following the table. Two federally-listed species (i.e., coastal California gnatcatcher and least Bell's vireo) and one federally Proposed Threatened species (i.e., monarch butterfly [*Danaus plexippus*; overwintering not expected]are known to occur in the BSA. Two State listed species (i.e., bald eagle and least Bell's vireo) and four State Candidate species (i.e., Crotch's bumble bee, white sturgeon [*Acipenser transmontanus*; only sterile individuals], burrowing owl [*Athene cunicularia*], and mountain lion) are known or have potential to occur in the BSA. Special status species that were observed or those with moderate potential to occur are discussed in more detail following the table.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Invertebrates						
Branchinecta sandiegonensis	San Diego fairy shrimp	FE	—	Conditionally Covered	Inhabits vernal pools and ephemeral depressions.	Not expected to occur; no suitable habitat.
Streptocephalus woottoni	Riverside fairy shrimp	FE	—	Conditionally Covered	Inhabits vernal pools and ephemeral depressions.	Not expected to occur; no suitable habitat.
Danaus plexippus (overwintering populations)	monarch butterfly	FPT	—	No	Overwintering sites consist of forested areas that provide protection from the elements and moderate temperatures, as well as nectar and clean water sources located nearby. Overwintering sites are within 1.5 miles of the Pacific Ocean at elevations of 200-300 feet above msl. Reproduction is dependent on the presence of milkweed (*Asclepias* sp.).	**Observed (individual foraging during spring); hostplant present;** not expected for overwintering because BSA is too far inland and is outside the known elevational range for overwintering.
Euphydryas editha quino	quino checkerspot butterfly	FE	CE	Conditionally Covered	Inhabits openings in chaparral and sage scrub and grasslands; erect plantain is one of the specific host plants where females lay eggs.	Not expected to occur; not observed during focused surveys; suitable habitat.
Bombus crotchii	Crotch's bumble bee	—	CE	No	Inhabits areas with appropriate food sources (e.g., *Fabaceae, Apocynaceae, Asteraceae, Lamiaceae, and Boraginaceae*).	Observed; suitable habitat.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Fish						
Acipenser transmontanus	white sturgeon	—	CT	No	Inhabits large rivers with deep waters (>12 feet deep) and swift currents; brackish and estuarine environments.	Sterile individuals known to be stocked in Irvine Lake by OC Parks; no suitable habitat and outside current known range of natural populations.
Oncorhynchus mykiss irideus pop. 10	steelhead – southern California DPS	FE	CE	No	Inhabits streams; can tolerate warmer water and more variable conditions.	Not expected to occur; no suitable habitat; outside current known range.
Rhinichthys gabrielino [*osculus* ssp. 8]	Santa Ana speckled dace	FPT	SSC	No	Inhabits permanently flowing streams, usually in shallow cobble and gravel riffles.	Not expected to occur; outside current known range[b].
Catostomus santaanae	Santa Ana sucker	FT	SSC	No	Inhabits coastal streams; prefer sand-rubble-boulder bottoms; cool, clear water; and algae.	Not expected to occur; outside current known range.
Amphibians						
Taricha torosa	Coast Range newt	—	SSC	No	Breeds in ponds, reservoirs, and slow-moving streams and lives in terrestrial habitats.	May occur; suitable habitat.
Spea hammondii	western spadefoot	FPT	SSC	Not Covered	Breeds in vernal pools in grassland habitats, but also hardwood woodlands.	May occur for foraging; not expected to occur for breeding because not observed during 2025 focused surveys; suitable foraging habitat; limited suitable breeding potential in pools or along slow-moving portions of Santiago Creek.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Anaxyrus californicus	arroyo toad	FE	SSC	Conditionally Covered	Inhabits rivers with sandy banks, willows, cottonwoods, and sycamores. Not observed during surveys for NCCP/HCP but area not thoroughly surveyed (County of Orange 1996).	Not expected to occur; not observed during focused surveys; suitable habitat.
Reptiles						
Actinemys pallida [*Emys marmorata*]	southwestern [western] pond turtle	FPT	SSC	No	Inhabits marshes, rivers, streams, and irrigation ditches, usually with aquatic vegetation and basking sites and suitable upland habitat.	Not expected to occur; not observed during focused surveys; suitable habitat.
Phrynosoma blainvillii	coast horned lizard	—	SSC	Covered	Inhabits a wide variety of habitats with open areas for sunning, bushes for cover, and patches of loose soil for burial.	Expected to occur; suitable habitat.
Aspidoscelis hyperythra	orange-throated whiptail	—	WL	Covered	Inhabits coastal scrub, chaparral, and hardwood woodlands; prefers washes and other sandy areas with patches of brush and rocks.	**Observed in the survey area.**
Aspidoscelis tigris stejnegeri	coastal whiptail	—	SSC	Covered	Inhabits deserts and semi-arid areas with sparse vegetation and open areas, woodland, and riparian areas.	**Observed in the survey area.**
Anniella stebbinsi	southern California legless lizard	—	SSC	No	Inhabits a variety of habitats, generally in moist, loose soil.	May occur; suitable habitat.
Arizona elegans occidentalis	California glossy snake	—	SSC	No	Inhabits a range of scrub and grassland habitats, often with loose or sandy soils.	May occur; suitable habitat.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Salvadora hexalepis virgultea	coast patch-nosed snake	—	SSC	No	Inhabits brushy or shrubby vegetation with small mammal burrows for refuge and overwintering sites.	May occur; suitable habitat.
Thamnophis hammondii	two-striped gartersnake	—	SSC	No	Found in or near permanent fresh water, often along streams with rocky beds and riparian growth.	**Observed in the survey area.**
Crotalus ruber	red-diamond rattlesnake	—	SSC	Covered	Inhabits rocky areas with dense vegetation in chaparral, woodland, grassland, and deserts.	Expected to occur; suitable habitat.
Birds						
Accipiter cooperii	Cooper's hawk	—	WL (nesting)	No	Forages in woodland. Nests in riparian growths of deciduous trees, such as canyon bottoms on river floodplains and in live oaks.	Expected to occur for foraging; may occur for nesting; suitable foraging and nesting habitat.
Buteo regalis	ferruginous hawk	—	WL (wintering)	No	Inhabits open grasslands, sagebrush flats, desert scrub, low foothills, and fringes of pinyon and juniper woodland.	May occur during migration and wintering; suitable habitat.
Elanus leucurus	white-tailed kite	—	FP (nesting)	No	Inhabits open grasslands, meadows, or marshes close to isolated, dense -topped trees for nesting and perching.	**Observed in the survey area.**
Haliaeetus leucocephalus	bald eagle	Delisted	SE/FP (nesting & wintering)	No	Nests in large, old-growth trees with open branches near water. Forages along ocean shore, lake margins, and rivers.	**Observed (nesting) immediately adjacent to the survey area; observed foraging in the survey area.**

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Aquila chrysaetos	golden eagle	—	WL/FP (nesting & wintering)	Conditionally Covered	Variety of open habitats (desert, grassland, shrubland, agriculture, streams) especially near mountains, hills, and cliffs.	May occur for foraging; not expected to occur for nesting; suitable foraging habitat; no suitable nesting habitat but potentially suitable nesting habitat adjacent.
Falco mexicanus	prairie falcon	—	WL (nesting)	Conditionally Covered	Variety of open habitats (desert, grassland, shrubland, agriculture, streams) especially near bluffs and cliffs that are used for nesting.	May occur for foraging; not expected to occur for nesting; suitable foraging habitat; no suitable nesting habitat but potentially suitable nesting habitat adjacent.
Falco peregrinus anatum	American peregrine falcon	Delisted	Delisted	Covered	Nests in a scrape, depression, or ledge in an open site on cliffs, banks, dunes, and mounds near wetlands, lakes, rivers, or other water.	**Observed in the survey area.**
Coturnicops noveboracensis	yellow rail	—	SSC	No	Inhabits freshwater marshlands.	Not expected to occur; no suitable habitat.
Laterallus jamaicensis coturniculus	California black rail	—	ST/FP	No	Inhabits freshwater marshes, wet meadows, and shallow margins of saltwater marshes bordering larger bays.	Not expected to occur; no suitable habitat.
Rallus obsoletus levipes	light-footed Ridgway's rail	FE	SE/FP	No	Inhabits salt marshes with dense growth of pickleweed or cordgrass.	Not expected to occur; no suitable habitat.
Sternula antillarum browni	California least tern	FE (nesting colony)	SE/FP (nesting colony)	No	Colonial breeder on bare or sparsely vegetated, flat substrates such as sand beaches, alkali flats, landfills, or paved areas along the coast.	Not expected to occur; no suitable habitat.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Coccyzus americanus occidentalis	western yellow-billed cuckoo	FT (nesting)	SE (nesting)	No	Nests in riparian forests along broad, lower flood-bottoms of larger river systems with willows, often mixed with cottonwoods, with understory of blackberry, nettles, or wild grape.	Not expected to occur; not observed during focused surveys; suitable habitat.
Asio otus	long-eared owl	—	SSC (nesting)	No	Inhabits riparian bottomlands with tall willows and cottonwoods, also belts of live oak along stream courses.	May occur for foraging and nesting; suitable foraging and nesting habitat.
Athene cunicularia	burrowing owl	—	CE/SSC (burrow sites & some wintering sites)	No	Inhabits open, dry annual or perennial grasslands, deserts, and scrublands with low-growing vegetation; uses California ground squirrel burrows and similar openings for breeding.	Limited potential to occur; suitable habitat; limited numbers in the region.
Empidonax traillii extimus	southwestern willow flycatcher	FE (nesting)	SE (nesting)	Conditionally Covered	Inhabits riparian habitat along rivers, stream, and other wetlands with dense growths of willows, mule fat, etc., often with a scattered overstory of cottonwood.	Not expected to occur; not observed during focused surveys; suitable habitat.
Lanius ludovicianus	loggerhead shrike	—	SSC (nesting)	No	Inhabits grasslands and other dry, open habitats.	May occur; suitable habitat.
Vireo bellii pusillus	least Bell's vireo	FE (nesting)	SE (nesting)	Conditionally Covered	Inhabits riparian forest, riparian scrub, and riparian woodland, usually nesting in willows, mule fat, or mesquite.	**Observed in the survey area.**

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Eremophila alpestris actia	California horned lark	—	WL	No	Inhabits short-grass prairie, "bald" hills, mountain meadows, open coastal plains, fallow agricultural fields, and alkali flats.	May occur; suitable habitat.
Campylorhynchus brunneicapillus sandiegensis	coastal cactus wren	—	SSC	Covered	Inhabits coastal sage scrub with tall prickly-pear cactus for nesting and roosting.	**Observed in the survey area.**
Polioptila californica californica	coastal California gnatcatcher	FT	SSC	Covered	Inhabits coastal sage scrub in arid washes, on mesas, and slopes.	**Observed in the survey area.**
Aimophila ruficeps canescens	southern California rufous-crowned sparrow	—	WL	Covered	Inhabits coastal sage scrub and sparse mixed chaparral, frequently on relative steep, rocky hillsides with grass and forb patches.	**Observed in the survey area.**
Ammodramus savannarum	grasshopper sparrow	—	SSC (nesting)	No	Inhabits dense grasslands on rolling hills, lowland plains, and valleys and on hillsides on lower mountain slopes.	**Observed in the survey area.**
Passerculus sandwichensis beldingi	Belding's savannah sparrow	—	SE	No	Inhabits coastal salt marshes, nesting in pickleweed on and about the margins of tidal flats.	Not expected to occur; no suitable habitat.
Icteria virens	yellow-breasted chat	—	SSC (nesting)	No	Inhabits riparian thickets of willow and other brushy tangles near watercourses; nests in low, dense riparian vegetation consisting of willows, blackberry, and wild grape.	**Observed in the survey area.**
Agelaius tricolor	tricolored blackbird	—	ST/SSC (nesting colony)	No	Inhabits freshwater marsh, swamps, and wetlands with open water and protected nesting substrate.	Not expected to occur; limited amount of suitable habitat.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Setophaga petechia	yellow warbler	—	SSC (nesting)	No	Inhabits riparian forest, riparian scrub, and riparian woodland, foraging and nesting in willow shrubs and thickets, cottonwoods, sycamores, ash, and alders.	**Observed in the survey area.**
Mammals						
Sorex ornatus salicornicus	southern California saltmarsh shrew	—	SSC	No	Inhabits coastal marshes with dense vegetation and woody debris for cover.	Not expected to occur; no suitable habitat.
Choeronycteris mexicana	Mexican long-tongued bat	—	SSC	No	Inhabits riparian scrub, pinyon and juniper woodland, and Sonoran thorn woodland; roosts in caves and in and around buildings.	Not expected to occur; outside current known range.
Antrozous pallidus	pallid bat	—	SSC	No	Inhabits deserts, grasslands, shrublands, woodlands, and forest, most commonly in open, dry habitats with rocky areas for roosting.	Limited potential to occur for foraging and roosting; suitable foraging and roosting habitat.
Nyctinomops femorosaccus	pocketed free-tailed bat	—	SSC	No	Inhabits pinyon-juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oasis. Roosts in crevices of cliffs and rocky outcroppings.	May occur for foraging and roosting; suitable foraging and roosting habitat.
Nyctinomops macrotis	big free-tailed bat	—	SSC	No	Rugged and rocky terrain; roosts in buildings, caves, rock crevices in cliffs, and rocky outcroppings.	May occur for foraging and roosting; suitable foraging and roosting habitat.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Lasiurus frantzii	western red bat	—	SSC	No	Riparian habitat near water. Roosts exclusively in trees, particularly sycamore, cottonwood, ash, and elderberry (*Sambucus* sp.).	May occur for foraging and roosting; suitable foraging and roosting habitat.
Lasiurus xanthinus	western yellow bat	—	SSC	No	Inhabits valley foothill riparian, desert riparian, desert wash, and palm oasis habitats. Roosts in trees, particularly palms. Forages over water and among trees.	May occur for foraging and roosting; suitable foraging and roosting habitat.
Eumops perotis californicus	western mastiff bat	—	SSC	No	Inhabits many open, semi-arid to arid habitats including conifer and deciduous woodlands, coastal scrub, grasslands, and chaparral. Roosts in crevices in cliff faces, high buildings, trees, and tunnels.	May occur for foraging and roosting; suitable foraging and roosting habitat.
Chaetodipus fallax fallax	northwestern San Diego pocket mouse	—	—	No	Inhabits coastal scrub, chaparral, grasslands, and sagebrush, usually in association with rocks or coarse gravel.	May occur; suitable habitat.
Perognathus longimembris pacificus	Pacific pocket mouse	FE	SSC	Conditionally Covered	Inhabits coastal scrub with fine alluvial sands; only occurs within a few miles of the coast.	Not expected to occur; outside current known range.
Neotoma bryanti [*lepida*] *intermedia*	Bryant's San Diego desert woodrat	—	SSC	Covered	Inhabits coastal scrub with moderate to dense canopies, rock outcrops, rocky cliffs, and slopes.	May occur; suitable habitat.

TABLE 16
SPECIAL STATUS WILDLIFE SPECIES REPORTED FROM THE PROJECT VICINITY

Species	Common Name	Federal Status	State Status	NCCP/HCP Covered Species	Habitat[a]	Potential to Occur
Onychomys torridus ramona	southern grasshopper mouse	—	SSC	No	Inhabits desert areas, especially scrub habitats with friable soils for digging with low to moderate shrub cover.	Not expected to occur; outside current known range
Puma concolor	mountain lion–Southern California/Central Coast Evolutionary Significant Unit (ESU)	—	CE	No	Inhabits various habitats within foothill and mountain areas typically where deer can be found.	**Observed (tracks) in the survey area.**

[a] Sources include CDFW 2025a and 2025d.

[b] CDFW is currently considering a translocation of Santa Ana speckled dace to Santiago Creek near its confluence with Black Star Canyon, about a mile upstream of Irvine Lake. Details are still being determined and are not yet available.

3.8.1 Monarch Butterfly

The monarch butterfly is proposed as a federally Threatened species by the USFWS; California overwintering sites would be protected by this status. Monarch butterflies lay their eggs on the obligate milkweed (*Asclepias* sp.). Multiple generations of monarchs are produced through the breeding season, with most adult butterflies living two to five weeks. Overwintering adults enter reproductive diapause and live for six to nine months (USFWS 2023). Each spring, monarchs leave overwintering sites and disperse across California and eventually migrate to all western states, searching for milkweed plants on which to lay their eggs. Several generations are produced throughout the spring, summer, and fall, with each generation spreading further across the landscape. The last generation then migrates all the way back to the overwintering grounds on the Pacific coast in the fall. Monarchs return to the same groves of trees each year (Xeres Society 2023). In the western U.S., monarchs overwinter at groves of trees along the Pacific Coast with a large concentration overwintering in California. Currently, the most common overwintering groves consist of non-native blue gum (*Eucalyptus* sp.), but they also use native Monterey pine (*Pinus radiata*), Monterey cypress (*Hesperocyparis macrocarpa*), western sycamore, coast live oak, and redwood (*Sequoia sempervirens*) (USFWS 2024b). The majority of overwintering sites are found within 1.5 miles of the Pacific Ocean, which moderates temperatures, at lower elevations (i.e., 200 to 300 feet above msl) and situated on slopes oriented to the south, southwest, or west that provide the most solar radiation (Xeres Society 2016).

Along with the proposed listing, the USFWS is proposing 4,395 acres of Critical Habitat for this species to protect overwintering sites in Alameda, Marin, Monterey, San Luis Obispo, Santa Barbara, Santa Cruz, and Ventura Counties, California (USFWS 2024b). The BSA is not within proposed Critical Habitat for this species.

Monarch butterfly was recorded as an incidental observation during the Quino checkerspot butterfly surveys and its hostplant, milkweed, was noted during botanical surveys. Western sycamore and coast live oak woodlands are present in the BSA; however, the BSA is over 20 miles from the Pacific Ocean and the elevation of the BSA is too high (i.e., 657 to 996 feet above msl). Additionally, there are no known overwintering sites mapped in the BSA (Xeres Society 2023). Therefore, monarch butterfly is not expected to overwinter in the BSA.

3.8.2 Crotch's Bumble Bee

The Crotch's bumble bee (*Bombus crotchii*) is proposed as a Candidate[13] to be State listed as Endangered. The Crotch's bumble bee is a ground nester and often makes its nest in abandoned mammal burrows and can be found in most native habitat types, although it prefers grassland and scrub habitats. It is primarily associated with plants from the following families: *Fabaceae, Apocynaceae, Asteraceae, Lamiaceae,* and *Boraginaceae* (Richardson 2017, Thorp et. al. 1983). Grassland and scrub habitat, as well as several plant species from these families are present; therefore, suitable habitat is present for this species. This species has been recently observed at multiple locations in the Project region. The most recent

[13] The CDFW treats Candidate species as if they are listed while they determine if they will be formally listed.

observations of this species were in 2020 in the Irvine Ranch Open Space along Santiago Creek in 2016 and in Trabuco Canyon in 2020 (CDFW 2025a).

Focused surveys were conducted in summer 2024; one male Crotch's bumble bee was observed foraging in a small patch of leafy California buckwheat, in the southern portion of the survey area (Exhibit 10). At the time of the focused surveys in the summer months, most plants were no longer flowering; floral resources were likely higher in the spring and early summer. The estimated percent cover of floral resources during the focused surveys was approximately 20 to 30 percent of the survey area during the June visit. During the focused surveys, the species in bloom consisted primarily of leafy California buckwheat, deerweed, short-podded mustard, and black mustard. Potential bumble bee nest sites and overwintering habitat included small rodent burrows and leaf litter.

3.8.3 White Sturgeon

White sturgeon is a Candidate to be listed as State Threatened. This species occurs in deep rivers (more than 12 feet deep) with swift flows. White Sturgeon can live in excess of 100 years, and historically grew to sizes of approximately 20 feet and 1,300 pounds (Moyle 2002). White Sturgeon are an anadromous fish native to California, where they primarily occur in San Francisco Bay and the Delta and spawn in the Sacramento and San Joaquin rivers and associated tributaries (CDFW 2024c). White sturgeon are not expected to occur in southern California streams, and therefore, are not expected to occur naturally in the BSA as it is outside the species' known range and does not provide suitable habitat. However, sterile individuals of white sturgeon are stocked in Irvine Lake by OC Parks (Hayes, pers. comm. 2023).

3.8.4 Santa Ana Speckled Dace

Santa Ana speckled dace (*Rhinichthys gabrielino* [*osculus* ssp. 8]) is proposed as a federally Threatened species by the USFWS. The Santa Ana speckled dace is a small freshwater fish that occurs in perennial streams and rivers. The species was historically found throughout the upper and middle reaches of the Los Angeles, San Gabriel, Santa Ana, and San Jacinto Rivers. Currently, Santa Ana speckled dace is restricted to the headwaters of those river systems, with limited connectivity for populations in the Santa Ana River and San Jacinto River. Santa Ana speckled dace inhabit a variety of stream habitats, with a preference for cool, moving water and gravel substrate that have aquatic invertebrates as a food source (USFWS 2024a). This species was reported from Modjeska Canyon near its confluence with Santiago Creek in 1999 (CDFW 2025a). The BSA is outside the current known range of the Santa Ana speckled dace. However, CDFW is currently considering translocating this species to a site along Santiago Creek near its confluence with Black Star Canyon, approximately 1.25 mile upstream of Irvine Lake (Pareti, pers. comm. 2024). If this species is translocated, the translocation success will be monitored by CDFW. Therefore, while this species is not currently expected to occur in the BSA, it could occur along Santiago Creek upstream of the lake in the future.

3.8.5 Western Spadefoot

The western spadefoot has recently been proposed as a federally Threatened species by the USFWS; it is also a California Species of Special Concern. Western spadefoot are restricted to California and northwestern Baja California, Mexico between sea level and 4,500 feet above msl. Adult toads forage and burrow in open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, playas, and alkali flats in foothills and mountains. They feed primarily on insects, worms, and other invertebrates. Western spadefoot are rarely seen, spending most of their life underground in earthen burrows up to three feet deep. Adults emerge from dry season refuges during late winter or spring rains, typically in February and March, and proceed to nearby breeding pools. Breeding habitat consists primarily of shallow, temporary rain pools that should persist for a minimum of 30 days following egg-laying. The temporary nature of the breeding habitat ensures a lack of predators such as fish, American bullfrog (*Lithobates catesbeiana*), and red-swamp crayfish (*Procambarus larkia*) that would otherwise reduce the likelihood of tadpoles reaching metamorphosis and adulthood. In Southern California, over 80 percent of habitat once known to be occupied by western spadefoot has been lost through loss of breeding habitat and/or fragmentation of breeding and foraging/burrowing habitat by development. The Central Coastal Subregion of the NCCP/HCP proposed to include western spadefoot as a Covered Species; however, there were not enough breeding pools conserved in the Central Subregion. Therefore, western spadefoot was designated a Covered Species only in the Coastal Subregion; it is not covered in the Central Subregion, which is where the BSA occurs. Suitable foraging habitat is present in the BSA; limited suitable breeding pools were observed in the BSA and the species also has a limited potential to breed along slow-moving portions of Santiago Creek. The western spadefoot has potential to occur within the BSA for foraging but has only a limited potential to breed in the BSA because the presence of suitable pools is limited and variable from year to year. Areas that appeared suitable for pooling in 2024 did not pool in 2025; new pools were observed in 2025 that were not observed in prior years. Focused surveys were conducted throughout the BSA in spring 2025; no western spadefoot were observed. While this species may occur in the BSA for foraging, it is not expected to occur in the BSA for breeding because it was not observed during focused surveys.

3.8.6 Southwestern Pond Turtle

The southwestern pond turtle is proposed as a federally Threatened species by the USFWS; it is also a California Species of Special Concern. The western pond turtle is the only native turtle species in coastal California; the former northwestern and southwestern subspecies were recently split into separate species, with the southwestern pond turtle (*Actinemys pallida*) occurring in Southern California. It is found in ponds, lakes, marshes, reservoirs, seasonal standing or slow-moving streams, canals, sloughs, vernal pools, and occasionally in brackish water (Germano and Bury 2001). Sufficient cover (e.g., vegetation, undercut banks) and basking sites are important components of suitable habitat (Spinks et al. 2003). Suitable basking sites include partially submerged logs, rocks, floating vegetation, and open mud banks (CDFW 2000). Adults are often observed basking on logs or other objects protruding out of the water or floating in the warmer surface water. They have both good hearing and

eyesight and are easily disturbed; they are often heard splashing into the water to take cover before they are seen (USGS 2006a). Southwestern pond turtles are omnivorous; aquatic invertebrates are the mainstay of the adult diet; but carrion, small fish, frogs, and some plants are also consumed (USGS 2006a). Adult southwestern pond turtles in Southern California may remain active in the water year-round if conditions are suitable (enough water, warm temperatures) (USGS 2006a). However, during the coldest months (October to April), this species will often seek upland refugia (i.e., shelter with appropriate temperature and moisture conditions) and enter a period of aestivation. Western pond turtles can also hibernate underwater in bottom mud (CDFW 2000). Habitat destruction for urban (primarily flood control) and agricultural development has resulted in population declines throughout the western pond turtle's range (Spinks et al. 2003). Over 90 percent of the wetland habitats within the historic range of the western pond turtle throughout California have been lost (USFWS 1992). Additionally, invasion of non-native plant and wildlife species into habitats occupied by western pond turtles is another threat to the continued survival of the species. Suitable habitat for western pond turtle is present throughout the BSA. Focused visual surveys and a trapping program were conducted in the BSA, including 108 trap days (27 traps multiplied by 4 days of trapping for each), in summer 2024. No southwestern pond turtles were observed during the focused surveys. Therefore, southwestern pond turtle is not expected to occur in the BSA.

3.8.7 Orange-throated Whiptail

Orange-throated whiptail is a California Watch List Species. It is a Covered species in the Central–Coastal NCCP/HCP. This species occurs in coastal scrub, chamise-redshank chaparral, mixed chaparral, and valley-foothill hardwood habitats from sea level to 3,410 feet above msl (Jennings and Hayes 1994). It prefers washes and other sandy areas with patches of brush and rocks (Stebbins 2003). It occurs in Orange, Riverside, and San Diego counties west of the crest of the Peninsular Ranges, especially in areas with summer morning fog. It also occurs in southwestern San Bernardino County (Zeiner et al. 1990).

Two juvenile orange-throat whiptails were observed during the 2022 focused least Bell's vireo surveys upstream of Santiago Creek Dam (Exhibit 10). Suitable habitat for this species is present throughout the BSA.

3.8.8 Coastal Whiptail

Coastal whiptail is a California Species of Special Concern. It is a Covered species in the Central–Coastal NCCP/HCP. This species occurs in a variety of habitats including valley-foothill hardwood, valley-foothill hardwood conifer, valley-foothill riparian, mixed conifer, pine-juniper, chamise-redshank chaparral, mixed chaparral, desert scrub, desert wash, alkali scrub, and annual grassland from sea level to 7,500 feet above msl. It occurs throughout much of the state (Zeiner et al. 1990).

Three adult coastal whiptails were observed during the 2022 focused least Bell's vireo surveys upstream of Santiago Creek Dam (Exhibit 10). Suitable habitat for this species is present throughout the BSA.

3.8.9 Two-striped Garter Snake

Two-striped garter snake is a California Species of Special Concern. This highly aquatic species occurs primarily in or near perennial or intermittent freshwater streams with rocky beds bordered by willows or other dense vegetation (Jennings and Hayes 1994; Stebbins 2003). The two-striped garter snake feeds on tadpoles, newt larvae, toads, frogs, fish, fish eggs, and earthworms (Stebbins 2003). It occurs from Monterey County south to El Rosario in Baja California, Mexico at elevations between sea level and approximately 8,000 feet above msl (Stebbins 2003). It is considered locally rare in southwestern California. It is estimated that development and other human impacts have reduced the historic range of this species in California by 40 percent (Stebbins 2003).

An individual two-striped garter snake was observed during the 2020 focused arroyo toad survey downstream of Santiago Creek Dam (Exhibit 10). Three individual two-striped garter snakes were observed during the 2022 focused arroyo toad surveys upstream of Santiago Creek Dam (Exhibit 10). Suitable habitat for this species is present along Santiago Creek throughout the BSA.

3.8.10 White-tailed Kite

White-tailed kite is a California Fully Protected species; its nesting locations are protected. This species nests in oak and sycamore woodlands, mature willows with adjacent grasslands, agricultural fields, and other open areas. Kites prey on voles (*Microtus* sp.) and other small, diurnal mammals, occasionally on birds, insects, reptiles, and amphibians. Kites forage in undisturbed, open grasslands, meadows, farmlands and emergent wetlands. They soar, glide, and hover (i.e., "kite") less than 100 feet above the ground in search of prey.

A pair of white-tailed kites was observed foraging during the 2022 focused least Bell's vireo surveys upstream of Santiago Creek Dam (Exhibit 10). Suitable foraging habitat for this species is present throughout the BSA; woodlands in the BSA provide suitable nesting habitat.

3.8.11 Bald Eagle

The bald eagle is a State-listed Endangered species, a California Fully Protected species, and is also protected by the Federal Bald Eagle Act. Through protection under the Endangered Species Act, bald eagle populations recovered through captive breeding programs, reintroduction efforts, the banning of DDT, and public education (USDA 2023). This species was delisted by the USFWS in 2007 and will be monitored for 20 years as part of the Post-Delisting Monitoring Plan for the species. This species requires large bodies of water or free-flowing rivers with abundant fish and adjacent snags or perches, and nests in large, old-growth trees or snags in remote stands near water (Zeiner et al. 1990). Bald eagles are usually found close to water because their diet is primarily made up of fish and waterfowl. When waterfowl migrate south for the winter, bald eagles follow and winter in southern California from November to March (USDA 2023). Most breeding territories are in northern California, but the eagles also nest in scattered locations in the central and southern Sierra Nevada mountains and foothills, in several locations from the Central Coast Range to inland southern California, and on Santa Catalina Island (CDFW 2024a). Breeding populations of

bald eagles in southern California were extirpated in the 1950s until reintroduction efforts began on Catalina Island in the 1980s. Since 2003, several pairs of bald eagles have nested in southern California at Lake Hemet, Lake Skinner, Lake Matthews, and Big Bear Lake (USDA 2023). CDFW tracks information on occupied territories for bald eagles in California; the location at Irvine Lake has been mapped as the only bald eagle nesting location in Orange County (CDFW 2024a).

An individual bald eagle was incidentally observed during vegetation mapping upstream of Santiago Creek Dam in fall 2020 and a nesting pair was observed during focused surveys in spring/summer 2022 (Exhibit 10). The pair nested in a pine tree in a canyon adjacent to the BSA. Suitable foraging and wintering habitat for this species is present throughout the BSA. While the ornamental trees within the BSA are not suitable because they are not mostly gum trees or too small for eagle nesting, suitable nesting habitat is adjacent to the BSA.

3.8.12 American Peregrine Falcon

The American peregrine falcon is a Covered species in the Central–Coastal NCCP/HCP. This species was delisted from the federal list of Endangered species in 1999 (USFWS 1999), and from the California list of Endangered species in 2008. It was recently removed from the CDFW list of Fully Protected species (CDFW 2025d). Peregrine falcons prey almost exclusively on birds and use a variety of habitats, particularly wetlands and coastal areas. While this falcon is a rare summer resident in Southern California, it is more common during migration and the winter season. For nesting, this falcon prefers inaccessible areas such as those provided by cliffs, high building ledges, bridges, and other such structures.

A peregrine falcon was observed foraging during the 2020 focused arroyo toad survey downstream of Santiago Creek Dam (Exhibit 10). Suitable foraging habitat is present for this species throughout the BSA. While there are cliffs in the BSA, they are limited in extent and do not provide many ledges for nesting raptors; however, cliffs suitable for nesting are adjacent to the BSA.

3.8.13 Least Bell's Vireo

Least Bell's vireo is a federal and state Endangered species. The least Bell's vireo was formerly considered a common breeder in riparian habitats throughout the Central Valley and other low-elevation riverine systems throughout California and Baja California, Mexico (USFWS 1998). The decline of least Bell's vireo is attributed to the widespread loss of riparian woodlands coupled with the increase in brown-headed cowbirds (USFWS 1986). Cowbirds are nest parasites that lay their eggs in the nests of other birds and leave the host bird to raise their young, often to the detriment of the host's own young (USFWS 1998). With the implementation of intensive brown-headed cowbird management programs, the least Bell's vireo numbers have dramatically increased (USFWS 1998). The least Bell's vireo is an obligate riparian species (i.e., nests exclusively in riparian habitat) that generally nests in early-successional stages of riparian habitats. The most critical factor in habitat structure is the presence of a dense understory shrub layer from approximately three to six feet above ground, where nests are typically placed, and a dense stratified canopy for foraging (Goldwasser 1981; Gray and Greaves 1981; Salata 1981, 1983; RECON 1989).

A total of 29 least Bell's vireo locations were observed during the 2022 focused surveys upstream of the dam (Exhibit 10). A total of 27 locations consisted of territories occupied by breeding pairs, 1 location consisted of a territory occupied by an unpaired male, and 1 location consisted of a transient male. A territory is defined as a singing male observed or heard consistently in the same general location on multiple surveys (i.e., defending a territory). A transient male is one observed during only one survey. The territory points shown on Exhibit 10 represent either a nest location or the general area where least Bell's vireos were observed and/or detected most of the time. A total of 25 pairs were observed to have successfully nested; a total of 38 juveniles were observed during the 2022 focused surveys. The survey results include only the number of nestlings/fledglings that were visually or aurally confirmed; additional fledglings may have been undetected in the habitat. Least Bell's vireo was incidentally observed in the riparian habitat downstream of the dam during focused surveys conducted in summer 2024 (Psomas 2024a; Exhibit 10). Suitable riparian habitat for this species is present along Santiago Creek throughout the BSA.

On February 2, 1994, the USFWS published a final critical habitat for the least Bell's vireo, designating approximately 37,560 acres of land in Santa Barbara, Ventura, Los Angeles, San Bernardino, Riverside, and San Diego counties, California (USFWS 1994). The Project site is not located in designated critical habitat for this species.

3.8.14 Coastal Cactus Wren

Coastal cactus wren is a California Species of Special Concern; only individuals in San Diego and Orange Counties are special status. It is a Covered species in the Central–Coastal NCCP/HCP. The full species occurs in arid and semi-arid regions from California, Nevada, Utah, Arizona, New Mexico, and Texas south to Mexico and Baja California, Mexico (Shuford and Gardali 2008). The *sandiegensis* subspecies occurs from northwestern Baja California, Mexico through San Diego County and into southern Orange County, though the taxonomic status of cactus wrens and northern limits of this subspecies is uncertain (Shuford and Gardali 2008; Proudfoot et al. 2000). Coastal cactus wrens typically inhabit coastal sage scrub and alluvial sage scrub habitats that have sufficient amounts of prickly pear cactus and/or cholla (*Opuntia prolifera*) (Shuford and Gardali 2008). Nests are built almost exclusively in cholla or prickly pear cactus (Shuford and Gardali 2008).

Coastal cactus wrens were observed during both the 2020 focused surveys downstream of Santiago Creek Dam and the 2022 focused surveys upstream of Santiago Creek Dam (Exhibit 10). Suitable foraging and nesting habitat for this species is present throughout the BSA.

3.8.15 Coastal California Gnatcatcher

The coastal California gnatcatcher is a federally Threatened species and a California Species of Special Concern. It is a Covered species in the Central–Coastal NCCP/HCP. This species occurs in most of Baja California, Mexico's arid regions, but this subspecies is extremely localized in the United States, where it predominantly occurs in coastal regions of highly urbanized Los Angeles, Orange, Riverside, and San Diego Counties (Atwood 1992). In California, this subspecies is a resident of coastal sage scrub vegetation types. The breeding season for the coastal California gnatcatcher ranges from late February to August. Nests are

generally placed in a shrub about three feet above ground. Brood parasitism by brown-headed cowbirds and loss of habitat to urban development have been cited as causes of coastal California gnatcatcher population decline (Unitt 1984; Atwood 1990).

One California gnatcatcher territory was observed during the 2020 focused California gnatcatcher surveys downstream of Santiago Creek Dam (Exhibit 10). This territory included a breeding pair, which successfully fledged at least three chicks. No coastal California gnatcatchers were observed breeding upstream of the dam within the BSA during the 2022 focused surveys; however, one coastal California gnatcatcher was detected just outside the BSA (Exhibit 10). Additionally, four gnatcatcher locations were incidentally observed during vegetation mapping and the jurisdictional delineation upstream of Santiago Creek Dam (Exhibit 10). These four locations consisted of two individual juveniles, one male, and one unidentified individual. Coastal California gnatcatcher was also incidentally observed downstream of the dam during focused surveys conducted in summer 2024 (Psomas 2024a; Exhibit 10). Suitable habitat for this species is present throughout the BSA.

USFWS published a Revised Final Rule designating Critical Habitat for the coastal California gnatcatcher in 2007 (USFWS 2007). This Revised Critical Habitat designates 197,303 acres in San Diego, Orange, Riverside, San Bernardino, Los Angeles, and Ventura Counties. The Project is not located within the designated Revised Critical Habitat for the coastal California gnatcatcher.

3.8.16 Southern California Rufous-Crowned Sparrow

Southern California rufous-crowned sparrow is a Watch List species. In California, the subspecies occurs on moderate to steep, dry, rocky, south- or west-facing slopes in scrub vegetation interspersed with patches of grasses and forbs or rock outcrops (Collins 1999). It is present throughout the year in Southern California and is threatened by loss of habitat due to urban and agricultural development.

Southern California rufous-crowned sparrows were observed during the 2020 focused surveys downstream of Santiago Creek Dam (Exhibit 10). Suitable foraging and nesting habitat for this species is present throughout the BSA.

3.8.17 Grasshopper Sparrow

Grasshopper sparrow is a California Species of Special Concern; its nesting locations are protected. This species nests in short to medium-height moderately open grasslands with scattered shrubs, alkaline meadows, and sage scrub-grassland ecotones. Loss of habitat to urbanization is the primary threat to this species.

Four individual grasshopper sparrows were observed during the 2022 focused least Bell's vireo surveys upstream of Santiago Creek Dam (Exhibit 10). At least one pair was observed defending a territory and is presumed to have nested in ruderal habitat.

3.8.18 Yellow-breasted Chat

Yellow-breasted chat is a California Species of Special Concern; its nesting locations are protected. This species nests in early successional riparian habitats with a well-developed shrub layer and open canopy. The loss and degradation of riparian habitat, as well as nest parasitism by brown-headed cowbirds have contributed to this species' decline in California.

A total of 43 yellow-breasted chats (15 pairs, 6 individual adults, and 7 juveniles) were observed during the 2022 focused least Bell's vireo surveys upstream of Santiago Creek Dam (Exhibit 10). Suitable riparian habitat for this species is present along Santiago Creek throughout the BSA.

3.8.19 Yellow Warbler

Yellow warbler is a California Species of Special Concern; its nesting locations are protected. This species occurs in riparian vegetation in close proximity to water along streams and in wet meadows. The loss and degradation of riparian habitat, as well as nest parasitism by brown-headed cowbirds have contributed to this species' decline in California.

A total of 10 yellow warblers (5 pairs) were observed during the 2022 focused least Bell's vireo surveys upstream of Santiago Creek Dam (Exhibit 10). Suitable riparian habitat for this species is present along Santiago Creek throughout the BSA.

3.8.20 Mountain Lion

The mountain lion is currently a Candidate to be State listed as Threatened as an Evolutionary Significant Unit comprised of the following subpopulations: (1) Santa Ana Mountains; (2) Eastern Peninsular Ranges; (3) San Gabriel/San Bernardino Mountains; (4) Central Coast South (Santa Monica Mountains); (5) Central Coast North (Santa Cruz Mountains); and (6) Central Coast Central. CDFW is in the process of reviewing the petition for listing and evaluating available information (CDFW 2024b). CDFW status review report was expected in November 2021; as of June 2023, its status has not been updated (CDFW 2024b). The mountain lion occurs throughout most of California except for the Mojave and Colorado Deserts and the croplands of the Central Valley. Mountain lions occur in a variety of habitats, especially brushy habitats and riparian areas with interspersed irregular terrain, rocky outcrops, and tree/brush edges. Mountain lions use caves, natural cavities and thickets for cover. Mountain lions use habitat connections for movement among fragmented core habitat (Zeiner 1988). A major threat to this species is fragmentation of habitat by spread of human developments and associated roads. Estimates of effective population size highlight genetic isolation and raise significant concerns for viability in Southern California and the Central Coast (Center for Biological Diversity 2019).

Tracks of a mountain lion were observed during the 2020 focused arroyo toad survey downstream of Santiago Creek Dam and during the 2022 focused surveys upstream of Santiago Creek Dam. Suitable habitat for this species is present throughout the BSA.

4.0 PROJECT IMPACTS

The determination of impacts in this analysis is based on a comparison of maps depicting Project grading limits and maps of biological resources in the BSA. The Project would modify the existing dam embankment, spillway/outlet tower along with raising the spillway, which would lead to infrequent inundation of the area between the 795.9-foot elevation contour and the 797.9-foot elevation around the perimeter of Irvine Lake (referred to as "additional inundation area") for an approximate maximum period of up to 45 days following large storms. Additionally, a SCE power line would need to be relocated around the Project (referred to as the "SCE Realignment"); impacts for the SCE Realignment are only shown where they are outside the permanent and temporary impact areas for the Project.

All permanent structural impacts are assumed to be contained within the permanent impact line identified on Exhibit 11. All construction activities, including equipment staging areas, borrow sites, and remedial grading are assumed to be contained within the temporary impact line identified on Exhibit 11. It should be noted that Irvine Lake will be partially or completely dewatered prior to construction of the access road along a dry portion of the lake bottom. Should these impact areas extend beyond the limits shown, additional analysis would be required.

Both direct and indirect impacts on biological resources have been evaluated. Direct impacts are those that involve the initial loss of habitats due to grading, construction, and construction-related activities. Indirect impacts are those that would be related to temporary disturbance from construction activities (e.g., noise, dust) and the long-term use of the Project. Raising the spillway would have the indirect effect of infrequent additional inundation following larger storm events during operation of the Project.

Biological impacts associated with the Project were evaluated with respect to the following special status biological issues:

- Species listed under federal or State Endangered Species Acts;
- Species proposed for listing under federal or State Endangered Species Acts;
- Non-listed species that meet the criteria in the definition of "Rare" or "Endangered" in the CEQA Guidelines (i.e., 14 California Code of Regulations, Section 15380)[14];
- Species designated as California Species of Special Concern, Fully Protected, or Watch List species;
- Vegetation types (synonymous with "habitat" and "community") suitable to support a federally or State-listed Endangered or Threatened plant or wildlife species;
- Streambeds, waterbodies, wetlands, and their associated vegetation;

[14] Section 15380 of the CEQA Guidelines indicates that a lead agency can consider a non-listed species (e.g., plant with a CRPR of 1B.1) to be Endangered, Rare, or Threatened if the species can be shown to meet the criteria in the definition of Rare or Endangered. For the purposes of this discussion, the current scientific knowledge on the population size and distribution for each special status species was considered in determining if a non-listed species meets the definitions for Rare and Endangered according to Section 15380 of the CEQA Guidelines.

- Vegetation types, other than wetlands, considered special status by regulatory agencies (e.g., USFWS, CDFW) or resource conservation organizations;
- Other species or issues of concern to regulatory agencies or conservation organizations; and
- Central–Coastal Subregion NCCP/HCP and Implementation Agreement.

The actual and potential occurrence of these resources in the BSA was correlated with the following significance criteria to determine whether the impacts of the Project on these resources would be considered significant.

IRWD has prepared specifications related to construction of the Project. Standard Best Management Practices (BMPs) that would be implemented during construction of the Project; these BMPs are considered Project Design Features (PDF). Project impacts were evaluated assuming the following PDFs would be implemented:

PDF-1. Worker Environmental Awareness Program (WEAP) Training. Prior to the initiation of construction activities, IRWD will retain a qualified Biologist (i.e., Biological Monitor) to provide a WEAP training for construction personnel to review the mitigation measures and permit requirements applicable to the construction phase. The Biological Monitor will require trained personnel to sign the WEAP Log to document that they have been trained and understand the mitigation measures and permit conditions. The Biological Monitor will repeat the WEAP training as-needed for new construction personnel.

PDF-2. Project Limits. Prior to construction, the Project limits will be clearly staked by IRWD or IRWD's Contractor and verified by the Biological Monitor.

PDF-3. NCCP/HCP Construction Minimization Measures. As required by the NCCP/HCP, IRWD will follow standard construction-related minimization Measures. These include removal of coastal sage scrub outside the California gnatcatcher breeding season (i.e., February 15 to July 15); pre-construction surveys for coastal California gnatcatchers; identification of coastal sage scrub habitat areas for protection as Environmentally Sensitive Areas (ESAs); and biological monitoring during all clearing of coastal sage scrub.

PDF-4. Tree Protection. To protect western sycamore and coast live oak trees adjacent to Project's permanent and temporary impact areas (Exhibit 11), protective fencing will be placed around all western sycamore and coast live oak trees located within 50 feet of the Project's permanent and temporary impact areas. The tree protection area will be 1.5 times the dripline of the tree. No stockpiling of materials will occur within the tree protection areas. Limbs of western sycamore and coast live oak trees can be pruned to allow construction equipment access. If large branches need to be removed or if more than 10 percent of the total canopy would be affected, pruning will be supervised by a Certified Arborist retained by IRWD.

PDF-5: Nesting Bird Protection. To the extent practicable, IRWD or IRWD's Contractor will conduct vegetation clearing during the non-breeding season (i.e.,

September 16 to January 31). If vegetation clearing will be initiated during the breeding season for nesting birds/raptors (i.e., February 1–September 15), IRWD or IRWD's Contractor will conduct the construction activity in compliance with the conditions set forth in the Migratory Bird Treaty Act. IRWD will retain a qualified Biologist to conduct a pre-construction survey for nesting birds and/or raptors within seven days prior to clearing of any vegetation or work near existing structures The nesting bird survey area will include a buffer of 100 feet around the work area for nesting birds and a buffer of 500 feet around the work area for nesting raptors. If an active nest is found, the Biologist will determine the appropriate protective buffer depending on the sensitivity of the species and the nature of the construction activity. The protective buffer will be 25–100 feet for nesting birds; 300–500 feet for special status bird species or nesting raptors; and 0.5 mile for golden eagle or prairie falcon. No work will be conducted in the protective buffer until a qualified Biologist determines that the nest is no longer active. The Biologist will map any nests found during survey efforts and their protective buffers and will provide the map to IRWD and the Contractor.

PDF-6. Speed Limit During Construction. The speed limit on construction access roads will be no more than 20 miles per hour. Signage will be posted throughout the construction areas and at multiple locations along the access road between the dam and the staging area at the upstream end of the lake. "Wildlife crossing" signage will also be posted along the access road between the dam and the staging area at the upstream end of the lake. Signage will be verified by the Biological Monitor.

PDF-7. Night Lighting. Night lighting will be directed away from adjacent habitat areas to the extent practicable. Shielding of night lighting during construction will be incorporated to ensure that ambient lighting is directed away from sensitive habitat areas. Appropriate shielding of night lighting will be verified by the Biological Monitor.

PDF-8. Prevent Spread of Invasive Species. Weed seeds entering the construction area via vehicles will be minimized by requiring construction vehicles to be washed prior to delivery to the Project site. Track-clean or other methods of vehicle cleaning will be used by the construction contractor to prevent weed seeds from entering/exiting the Project site on vehicles. Wattles used for erosion control will be biodegradable and certified as weed-free. Seed mixes and/or hydroseed applied to temporarily disturbed areas will consist of native species local to the Project vicinity. IRWD will retain a qualified Biologist to review and approve the seed mix. Use of measures to prevent the spread of invasive species will be verified by the Biological Monitor.

PDF-9. Treatment of Invasive Species. During active construction, IRWD will retain a qualified Biologist to conduct surveys for non-native invasive plant species on the OC Parks target list on a monthly basis. If a target species is observed within 100 feet of the active construction area, IRWD will retain a qualified Contractor to remove and/or treat the non-native invasive plant species and to appropriately dispose of it. The target species will be removed/treated before they set seed.

For a period of two years following completion of construction, IRWD will retain a qualified Biologist to conduct surveys for non-native invasive plant species on the OC Parks target list on a quarterly basis. If a target species is observed within 100 feet of the previously disturbed areas, IRWD will retain a qualified Contractor to remove and/or treat the non-native invasive plant species and to appropriately dispose of it. The target species will be removed/treated before they set seed.

4.1 SIGNIFICANCE CRITERIA

The environmental impacts relative to biological resources are assessed using impact significance criteria that mirror the policy contained in CEQA, Section 21001(c) of the California Public Resources Code. Accordingly, the State Legislature has established it to be the policy of the state to:

> *"Prevent the elimination of fish or wildlife species due to man's activities, ensure that fish and wildlife populations do not drop below self-perpetuating levels, and preserve for future generations representations of all plant and animal communities…"*

Determining whether a project may have a significant effect, or impact plays a critical role in the CEQA process. According to CEQA, Section 15064.7, Thresholds of Significance, each public agency is encouraged to develop and adopt (by ordinance, resolution, rule, or regulation) thresholds of significance that the agency uses in the determination of the significance of environmental effects. A significant threshold is quantitative, qualitative, or performance level of a particular environmental effect, that would normally be determined to be significant by the agency if the threshold is exceeded.

In the development of thresholds of significance for impacts to biological resources CEQA provides guidance primarily in Section 15065, Mandatory Findings of Significance, and the CEQA Guidelines, Appendix G, Environmental Checklist Form. Section 15065(a) states that a project may have a significant effect where:

> *"The Project has the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or wildlife community, reduce the number or restrict the range of an endangered, rare, or threatened species…"*

Appendix G of the CEQA Guidelines is more specific in addressing biological resources and encompasses a broader range of resources to be considered, including: candidate, sensitive, or special status species; riparian habitat or other sensitive natural communities; federally protected wetlands; fish and wildlife movement corridors; local policies or ordinances protecting biological resources; and, adopted HCPs. These factors are considered through the checklist of questions answered during the Initial Study process that is used to determine appropriate environmental documentation for a project (i.e., Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report). Because these questions are derived from standards in other laws, regulations, and other commonly used thresholds, it is reasonable to use these standards as a basis for defining significance thresholds for an environmental document. For each of the thresholds identified below, the section of CEQA

upon which the threshold was derived has been provided. For the purpose of this analysis, impacts to biological resources are considered significant (before considering offsetting mitigation measures) if one or more of the follow conditions would result from implementation of the Project:

1. *If the Project has the potential to substantially degrade the quality of the environment. (15065[a])*
2. *If the Project has the potential to substantially reduce the habitat of a fish or wildlife species. (15065[a])*
3. *If the Project will cause a fish or wildlife populations to drop below self-sustaining levels. (15065[a])*
4. *If the Project will threaten to eliminate a plant or animal community. (15065[a])*
5. *If the Project will reduce the number or restrict the range of an endangered, rare, or threatened species[15]. (15065[a])*
6. *If the Project has a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Game and Wildlife Service (CEQA Guidelines, Appendix G, IV. [a]).*
7. *If the Project has a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service (CEQA Guidelines, Appendix G, IV. [b]).*
8. *If the Project has a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means (CEQA Guidelines, Appendix G, IV. [c]).*
9. *If the Project interferes substantially with the movement of any native or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impedes the use of native wildlife nursery sites (CEQA Guidelines, Appendix G, IV. [d]).*
10. *If the Project conflicts with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance CEQA Guidelines, Appendix G, IV. [e]).*
11. *If the Project conflicts with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan (CEQA Guidelines, Appendix G, IV. [f]).*

[15] Endangered and threatened species as used in this threshold are those listed by USFWS and/or CDFW as Threatened or Endangered. Section 15380 of CEQA indicates that a lead agency can consider a non-listed species (e.g., CRPR 1B plants) to be Endangered, Rare, or Threatened for the purposes of CEQA if the species can be shown to meet the criteria in the definition of rare or endangered. For the purposes of this discussion, the current scientific knowledge on the population size and distribution for each special status species was considered in determining if a non-listed species met the definitions for rare and endangered according to Section 15380 of CEQA.

An evaluation of whether an impact on biological resources would result in a "substantial adverse effect" must consider both the resource itself and how that resource fits into a regional context. For the Project, the regional setting of the Project includes the Central–Coastal Subregion NCCP/HCP. This subregion is bound by the SR-55 and SR-91 freeways to the north, the County boundary to the east, El Toro Road and Interstate-5 to the south, and the Pacific Coast to the west.

For the purposes of the impact analysis, "substantial adverse effect" is defined as the loss or harm of a magnitude which, based on current scientific data and knowledge, would 1) substantially diminish population numbers of a species or distribution of a habitat type within the region, or 2) eliminate the functions and values of a biological resource in the region.

4.2 DIRECT IMPACTS

The actual and potential occurrence of biological resources in the BSA vicinity was correlated with the significance criteria described above to determine whether impacts from the Project on these resources would be significant. Potential direct impacts are described below.

4.2.1 Vegetation Types and Other Areas

Vegetation types and other areas that would be impacted by the Project, SCE Realignment, and Additional Inundation Area are shown in Table 17 and Exhibit 11. It should be noted that within the SCE Realignment outside of the permanent and temporary impact area, only trees and branches would be removed; other vegetation would not be temporarily removed but may be disturbed by access and movement of construction materials through the area. The vegetation types that would be impacted by the Project are discussed below.

TABLE 17
VEGETATION ACREAGE IMPACTS OF THE PROJECT[a]

[a] The impact by landowner (i.e., IRWD or County of Orange) is included in Appendix N.

[b] Within the SCE Realignment, only trees and branches would be removed; other vegetation would not be temporarily removed but may be disturbed by access and movement of construction materials through the area.

Coastal Sage Scrub

A total of 8.41 acres (3.95 acres permanent; 4.39 acres temporary; 0.07 acre within the SCE realignment) of coastal sage scrub vegetation would be removed to construct the Project (Table 17). Coastal sage scrub vegetation types that would be impacted include sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote brush scrub, and disturbed floodplain sage scrub. The NCCP/HCP protects coastal sage scrub in the Central–Coastal Subregion because it provides habitat for Covered Species. Additionally, disturbed floodplain sage scrub is considered a sensitive natural community by CDFW.

The Project would also temporarily impact up to 3.36 acres of sage scrub vegetation types in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). Coastal sage scrub in the additional inundation area includes sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote brush scrub, southern cactus scrub, and disturbed southern cactus scrub. The NCCP/HCP protects coastal sage scrub in the Central–Coastal Subregion because it provides habitat for Covered Species. Additionally, southern cactus scrub and disturbed southern cactus scrub are considered sensitive natural communities by CDFW.

Per Section 5.11 of the NCCP/HCP, infrastructure is an existing use that is allowed within the Reserve. Take of coastal sage scrub is fully covered by participation in the NCCP/HCP for IRWD. Additionally, the NCCP/HCP requires avoidance and minimization measures during removal of coastal sage scrub habitat to protect NCCP/HCP Covered Species. Implementation of Mitigation Measure #1 would ensure that IRWD's take is accounted for according to the NCCP/HCP. Standard NCCP/HCP construction minimization measures would also be implemented (PDF-3).

Chaparral

A total of 4.70 acres (2.52 acres permanent; 2.18 acres temporary) of toyon–sumac chaparral would be removed to construct the Project (Table 17). While the loss of chaparral would be considered adverse, the loss would be limited in relation to the total amount of chaparral vegetation available in the Project region. Toyon–sumac chaparral is not considered a sensitive natural community by CDFW. Impacts on toyon–sumac chaparral would be considered less than significant; therefore, no mitigation would be required.

The Project would also temporarily impact up to 0.18 acre of toyon–sumac chaparral in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). As described above, impacts on toyon–sumac chaparral would be considered less than significant, and no mitigation would be required.

Grassland

A total of 34.74 acres (5.92 acres permanent; 28.81 acres temporary; 0.01 acre within the SCE realignment) of grassland vegetation would be removed to construct the Project (Table 17). Grassland vegetation types that would be impacted include annual grassland and ruderal. These vegetation types are generally considered of low biological value, are relatively common in the Project region, and are not considered sensitive natural

communities by CDFW. Impacts on grassland would be considered less than significant; therefore, no mitigation would be required.

The Project would also temporarily impact up to 3.23 acres of grassland vegetation types in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). As described above, impacts on grassland would be considered less than significant; therefore, no mitigation would be required.

Riparian

A total of 36.73 acres (1.45 acre permanent; 35.28 acres temporary) of riparian vegetation would be removed to construct the Project (Table 17). Riparian vegetation types that would be impacted include riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern black willow forest, disturbed southern black willow forest, and southern black willow forest/riparian herb. Impacts on riparian vegetation types are considered significant because federal and State resource agencies (i.e., USACE, CDFW, and RWQCB) have given these vegetation types special status due to their high biological value; jurisdictional areas are discussed below under Jurisdictional Resources (Section 4.2.2). Riparian vegetation types also provide potential habitat for federal and State-listed species. Additionally, southern willow scrub, southern black willow forest, disturbed southern black willow riparian forest, and southern black willow riparian forest/riparian herb are also considered sensitive natural communities by CDFW.

The Project would also temporarily impact up to 9.66 acres of riparian vegetation types in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). Riparian vegetation types in the additional inundation area include disturbed mulefat scrub, southern sycamore riparian woodland, southern black willow forest, and disturbed southern black willow forest. As described above, these vegetation types have been given special status due to their high biological value and potential to support federal and State-listed species. Additionally, southern sycamore riparian woodland, southern black willow forest, and disturbed southern black willow forest are considered sensitive natural communities by CDFW.

Implementation of Mitigation Measure #2 would ensure that compensatory mitigation such as establishment of on-site or off-site riparian habitat, payment of in-lieu mitigation fees, and/or preservation of off-site riparian habitat at IRWD lands is implemented to mitigate for the loss of riparian vegetation types.

Woodland

A total of 3.57 acres (0.53 acre permanent; 2.99 acres temporary; 0.05 acre within the SCE realignment) of woodland vegetation would be removed to construct the Project (Table 17). This may include trimming of trees along access roads. Woodland vegetation types that would be impacted include coast live oak woodland and western sycamore. Western sycamore is considered a sensitive vegetation community by CDFW.

The Project would also temporarily impact up to 0.50 acre of woodland vegetation types in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect

Impacts). Woodland vegetation in the additional inundation area is coast live oak woodland. Coast live oak woodland is not considered a sensitive natural community by CDFW. Impacts on coast live oak woodland would be considered less than significant; therefore, no mitigation would be required for the vegetation community. However, portions of the woodland are within jurisdictional areas (discussed below in Jurisdictional Resources, Section 4.2.2).

Implementation of Mitigation Measure #2 would ensure that compensatory mitigation such as establishment of on-site or off-site riparian habitat, payment of in-lieu mitigation fees, and/or preservation of off-site riparian habitat at IRWD lands is implemented to mitigate for the loss of woodland vegetation types. Implementation of Mitigation Measure #3 would ensure that any western sycamores removed would be replaced. Standard tree protection measures to fence coast live oak and western sycamores within or near the work area would also be implemented (PDF-4).

Cliff

A total of 0.52 acre (0.30 acre permanent, 0.21 acre temporary; 0.01 acre within the SCE realignment) of cliff would be impacted to construct the Project (Table 17). The loss of cliff relative to the availability of this mapping unit in the Project region would be limited in relation to the total amount of cliff available in the Project region. Impacts on cliff would be considered less than significant; therefore, no mitigation would be required.

The Project would also temporarily impact up to 0.01 acre of cliff in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). As discussed above, impacts on cliff would be considered less than significant; therefore, no mitigation would be required.

Lakes, Reservoirs, and Basins

A total of 183.53 acres (0.33 acre permanent; 183.20 acres temporary) of lakes, reservoirs, and basins would be impacted to construct the Project (Table 17). Mapping units and vegetation types that would be impacted include open water, fluctuating shoreline, and vegetated fluctuating shoreline. Impacts on these areas are considered significant because federal and State resource agencies (i.e., USACE, CDFW, and RWQCB) have given these areas special status due to their high biological value; jurisdictional areas are discussed below in Jurisdictional Resources (Section 4.2.2). These areas are not considered sensitive natural communities by CDFW.

The Project would not impact open water, fluctuating shoreline, or vegetated fluctuating shoreline in the additional inundation area (as they are mapped within the existing inundation area).

Implementation of Mitigation Measure #2 would ensure that compensatory mitigation such as establishment of on-site or off-site riparian habitat, payment of in-lieu mitigation fees, and/or preservation of off-site riparian habitat at IRWD lands is implemented to mitigate for impacts on these areas.

Watercourses

There would be no impact on watercourses (i.e., perennial stream) and no mitigation would be required.

Developed Areas

A total of 6.27 acres (2.47 acres permanent; 3.80 acres temporary) of developed areas would be impacted to construct the Project (Table 17). Mapping units and vegetation types that would be impacted include ornamental and developed. Developed and ornamental vegetation are generally considered of low biological value and are relatively common in the Project region. Impacts on developed areas would be considered less than significant; therefore, no mitigation would be required.

The Project would also temporarily impact up to 2.27 acres of developed areas in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). As described above, impacts on developed areas would be considered less than significant; therefore, no mitigation would be required.

Disturbed

Approximately 3.98 acres (0.03 acre permanent; 3.95 acres temporary) of disturbed areas would be impacted to construct the Project (Table 17). These areas are considered of low biological value. Therefore, this impact is considered less than significant, and no mitigation would be required.

The Project would also temporarily impact up to 0.83 acre of disturbed areas in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). As described above, impacts on disturbed areas would be considered less than significant; therefore, no mitigation would be required.

4.2.2 Jurisdictional Resources

Jurisdictional resources that would be impacted by the Project, SCE Realignment, and Additional Inundation Area are discussed below.

USACE

A total of 203.570 acre of WOTUS under the regulatory authority of the USACE would be impacted to construct the Project (wetland: 0.000 acre permanent, 63.915 acres temporary; non-wetland: 1.798 acres permanent, 137.857 acres temporary) (Table 18; Exhibit 12). This represents impacts to WOTUS in Irvine Lake, Santiago Creek, and Drainage 1. There would be no impact on USACE jurisdiction for the SCE Realignment.

The Project would impact an additional 0.673 acre of WOTUS (0.673 acre wetland) with the additional inundation area (Table 18; Exhibit 12). The inundation of these areas would be infrequent and limited in duration. Additionally, these areas are already within the OHWM; additional inundation of areas under the jurisdiction of USACE would be considered less than significant.

Implementation of Mitigation Measure #2 would ensure that compensatory mitigation such as establishment of on-site or off-site riparian habitat, payment of in-lieu mitigation fees, and/or preservation of off-site riparian habitat at IRWD lands is implemented to mitigate for the loss of WOTUS under the jurisdiction of USACE.

RWQCB

A total of 203.641 acres of waters of the State under the regulatory authority of the RWQCB would be impacted to construct the Project (wetland: 0.000 acres permanent, 63.915 acres temporary; non-wetland: 1.861 acres permanent, 137.865 acres temporary) (Table 18; Exhibit 13). This represents impacts to waters of the State in Irvine Lake, Santiago Creek, Drainage 1, Drainage 2, and Drainage 3. There would be no impact on RWQCB jurisdiction for the SCE Realignment.

The Project would impact an additional 0.711 acre of waters of the State (0.673 acre wetland, 0.038 acre non-wetland) with the additional inundation area (Table 18; Exhibit 13). The inundation of these areas would be infrequent and limited in duration. Additionally, these areas are already within the OHWM, subject to existing water flow, and/or are riparian in nature; additional inundation of areas under the jurisdiction of RWQCB would be considered less than significant.

Implementation of Mitigation Measure #2 would ensure that compensatory mitigation such as establishment of on-site or off-site riparian habitat, payment of in-lieu mitigation fees, and/or preservation of off-site riparian habitat at IRWD lands is implemented to mitigate for the loss of waters of the State under the jurisdiction of RWQCB.

CDFW

A total of 233.774 acres of waters under the regulatory authority of CDFW would be impacted to construct the Project (3.924 acres permanent; 229.850 acres temporary) (Table 18; Exhibit 14). This represents impacts to waters under the authority of CDFW in Irvine Lake, Santiago Creek, Drainage 1, Drainage 2, and Drainage 3.

The Project would impact an additional 8.980 acres of waters under the authority of CDFW with the additional inundation area (Table 18; Exhibit 14). The inundation of these areas would be infrequent and limited in duration. Additionally, these areas are already within the existing bed and bank, subject to existing water flow, and/or are riparian in nature; additional inundation of areas under the jurisdiction of CDFW would be considered less than significant.

Implementation of Mitigation Measure #2 would ensure that compensatory mitigation such as establishment of on-site or off-site riparian habitat, payment of in-lieu mitigation fees, and/or preservation of off-site riparian habitat at IRWD lands is implemented to mitigate for the loss of waters of the State under the jurisdiction of CDFW.

[a] Portions of the Permanent and Temporary impact boundaries overlap the "Additional Inundation Area". This overlap is not being excluded because the Additional Inundation Area represents a long-term, periodic change in maximum lake level as opposed to a permanent structural impact or temporary construction impact.

4.2.3 Wildlife

Native and non-native vegetation provide valuable nesting, foraging, roosting, and denning opportunities for a variety of wildlife species. A total of 98.05 acres (8.75 acres permanent; 89.17 acres temporary; 0.13 acre within the SCE realignment) of native vegetation types (including coastal sage scrub, chaparral, riparian, woodland, cliff, fluctuating shoreline, and vegetated fluctuating shoreline) would be removed to construct the Project (Table 17). Additionally, a total of 39.96 acres (5.98 acres permanent; 33.97 acres temporary; 0.01 acre within the SCE realignment) of non-native vegetation (including grasslands, ornamental, and disturbed) would be removed to construct the Project (Table 17). Removing or altering habitats would likely result in the loss of small mammals, reptiles, amphibians, and other slow-moving wildlife that live in the Project's direct impact area. More mobile wildlife species that are now using these areas would be forced to move into adjacent areas of open space, which would increase competition for available resources in those areas. This situation would result in the loss of individuals that cannot successfully compete. The loss of wildlife habitat relative to the availability of habitat in the Project region would be considered adverse; however, the loss would be limited in relation to the total amount of wildlife habitat available in the Project region. Therefore, it would not be expected to reduce populations of common wildlife species below self-sustaining levels in the Project region. Therefore, this impact would be considered adverse but less than significant, and no mitigation would be required. Additionally, the NCCP/HCP mitigated for loss of native habitat through the creation of a Reserve System that provides habitat for common wildlife as well as the Covered Species.

Dewatering Irvine Lake during construction would temporarily reduce the amount of open water available for wildlife species to forage and drink during Project construction; however, drinking water would continue to be available upstream/downstream of the lake along Santiago Creek. Following completion of the Project, open water would again be available for foraging and drinking water.

Several common bird species have the potential to nest in the vegetation, on the ground, or in structures in the BSA. The loss of an active migratory bird nest, including nests of common species, would be considered a violation of the MBTA and Sections 3503, 3503.5, and 3513 of *California Fish and Game Code*. The MBTA and *California Fish and Game Code* prohibit the taking of migratory birds, nests, and eggs. Standard pre-construction surveys and nesting bird protection would be implemented to ensure consistency with the MBTA and *California Fish and Game Code* (PDF-5). Therefore, impacts on nesting birds would be less than significant assuming compliance with regulatory requirements.

The Project would also temporarily impact up to 13.71 acres of native vegetation types and 4.53 acres of non-native vegetation types in the additional inundation area; inundation effects are discussed under Section 4.2.6 (Indirect Impacts). If an area was inundated, it is assumed that wildlife would move to higher ground, and once the water subsided, the habitat would again be available to wildlife. Because the inundation would only affect a strip of habitat up to two feet in elevation, and there is a substantial amount of habitat available adjacent to the additional inundation area, the inundation would be considered a less than significant impact on wildlife and no mitigation would be required.

The additional inundation areas would be expected to be inundated during the storm season, which is generally outside the peak bird breeding season. The inundation would be associated with natural storm events, which could lead to a natural loss of nests early in the spring. The potential inundation of nests is expected to be extremely limited because (1) it would only affect species nesting within two feet in elevation above the current maximum water line; (2) it would only affect species nesting in February and March; and (3) it would only occur approximately once every several years. Therefore, the effect on nesting birds would be expected to be less than significant and no mitigation would be required.

4.2.4 Wildlife Movement

Santiago Creek Dam presents an existing barrier to wildlife movement for fish and amphibians along the Creek. As such, existing wildlife movement in the BSA is expected to be restricted to movement along the creek upstream of Irvine Lake and movement along the creek downstream of the dam. Although wildlife may avoid the dry lakebed during construction, the Project would not be expected to interfere with movement upstream or downstream of construction area. Wildlife species (e.g., mountain lion) would be expected to move through upland areas or along the edge of the Project through habitat not impacted by the Project. The Project would include night construction, which could temporarily decrease wildlife movement in the vicinity of construction at the dam embankment, spillway, near the staging area, and along access roads that are used by medium to large-sized mammals for movement at night. However, medium to large-sized mammals and other wildlife would still able to use ridgelines that would not be affected by the Project. It is possible that wildlife may choose to move along the roads despite the construction, which

would increase the potential for wildlife strikes along the roadways at night. Speed limits and wildlife crossing signage would be posted along access roads (PDF-6). Therefore, the impact on wildlife movement would be less than significant.

The Project would permanently impact 14.73 acres of habitat downstream of the dam along Santiago Creek that wildlife currently moves through (Table 17); however, it would be in the same location as the existing dam structure; it would not create a new barrier to movement.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet); it would not create any new barriers to wildlife movement. Therefore, the effect of the additional inundation on wildlife movement would be less than significant and no mitigation would be required.

4.2.5 Special Status Biological Resource Impacts

Special Status Plant Species

Focused plant surveys were conducted downstream of the dam in spring/summer 2020 and upstream of the dam in spring/summer 2022. Five species were observed: Braunton's milk-vetch (federally Endangered, CRPR 1B.1), intermediate mariposa lily (CRPR 1B.2), many-stemmed dudleya (CRPR 1B.2), mud nama (CRPR 2B.2), and Coulter's matilija poppy (CRPR 4.2).

One individual Braunton's milkvetch was observed in the sandy channel of Santiago Creek, upstream of the lake. This location is outside of the impact footprint for the Project (Exhibit 15). Therefore, there would be no impact on this species and no mitigation would be required.

One individual intermediate mariposa lily was observed downstream of the dam; this individual would be impacted by the Project (Exhibit 15). Five individual intermediate mariposa lilies were observed in three locations upstream of the dam. All of the intermediate mariposa lily locations observed upstream of the dam are located outside of the impact footprint of the Project (Exhibit 15). Intermediate mariposa lily is a Covered Species under the NCCP/HCP; impacts up to 20 individuals are covered. Therefore, no mitigation would be required. To further minimize the impact, intermediate mariposa lily has been included with Mitigation Measure #4.

Approximately 810 many-stemmed dudleya individuals were observed in 2 locations downstream of the dam. Approximately 800 individuals were observed in the eastern portion of the plant survey area and 10 individuals were observed on a steep, east-facing cliff in the western portion of the plant survey area. The larger population of dudleya (800 individuals) is located outside of the impact footprint of the Project, but the smaller population (10 individuals) is located within the impact area (Exhibit 15). Although not formally listed under the federal or State Endangered Species Acts, many-stemmed dudleya is considered rare, threatened, or endangered within its range, and is fairly threatened in California (20–80 percent of its populations are threatened). However, the loss of 10 individuals of the 810 observed downstream of the dam represents 1.2 percent of the

individuals observed; therefore, the loss of 10 individuals of many-stemmed dudleya downstream of the dam would be considered adverse but less than significant. To further minimize the impact, many-stemmed dudleya has been included with Mitigation Measure #4.

Multiple populations of mud nama were observed in the southern portion of Irvine Lake (Exhibit 15). This area experiences periodic inundation and was mapped as open water during vegetation mapping in 2020. At the time of the special status plant survey, the substrate was exposed and consisted of riparian herb vegetation; the species was growing in more open areas, including along disturbed roads/trails. Because the individuals covered a large area and the species is small in stature, the population size was estimated based on density and square footage of each mapped polygon. The total population was estimated to be between 3.5 and 5.5 million. Current Project design shows that the borrow areas would impact 7.08 acres (308,405 square feet) of the mapped mud nama, which is estimated to be 86 to 89 percent of the mud nama present in the BSA (Table 19). This impact would be significant under CEQA Guidelines Section 15380. Once IRWD receives the results of the 2025 geotechnical investigations, Project Engineers would further refine the impact boundary to avoid and minimize impacts on mud nama to the extent feasible; IRWD is committed to avoiding at least 50 percent of the mud nama population (as mapped in 2022). Implementation of Mitigation Measure #4 would require pre-construction surveys by a qualified Botanist to flag the boundary of the population and to make recommendations for avoiding impacts to the extent feasible. With implementation of Mitigation Measure #4, which requires the avoidance of at least 50 percent of the mud nama populations (as mapped in 2022) and compensatory mitigation, impacts on mud nama would be considered less than significant.

TABLE 19
MUD NAMA POPULATION INFORMATION

Population Number	Estimated Population Density	Population Area (square feet)	Estimated Existing Population Size (Number of Individuals)	Extent of Impact
1	High density	25,023	875,805 – 1,000,920	100% Impacted
2	Moderate density	15,709	314,180 – 392,725	100% Impacted
3*	n/a	n/a	100	100% Impacted
4*	n/a	n/a	1,000	100% Impacted
5	Low density	284,500	1,422,500 – 2,845,000	77% Impacted; 219,499 sq. ft. (1,095,325–2,190,650 individuals)
6	Low density	12,647	63,235 – 126,470	100% Impacted
7	Low density	1,121	5,605 – 11,210	100% Impacted
8	High density	1,036	36,260 – 41,440	100% Impacted
9	Low density	3,053	15,265 – 30,530	100% Impacted
10	Low density	9,367	46,835 – 93,670	100% Impacted
11	High density	17,305	605,675 – 692,200	100% Impacted
12	Low density	8,335	41,675 – 83,350	10% Impacted; 871 sq. ft. (4,168–8,335 individuals)
		Total	**3,428,135 – 5,318,615**	**86 –89% Impacted 3,063,453–4,589,250**

High Density: 35–40 individuals per square foot; Moderate Density: 20–25 individuals per square foot; Low Density: 5–10 individuals per square foot

*Populations 3 and 4 were small and population sizes were estimated directly.

Approximately 46 Coulter's matilija poppy clones were observed in 3 populations downstream of the dam and one individual was observed along Santiago Creek upstream of the lake. These populations are all located within the temporary impact footprint of the Project (Exhibit 15). Coulter's matilija poppy is a Covered Species in the NCCP/HCP; therefore, no mitigation would be required. To further minimize the impact, Coulter's matilija poppy has been included with Mitigation Measure #4.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet). The additional inundation may temporarily affect two of the intermediate mariposa lily locations on the northwestern side of Irvine Lake and the mud nama located within the lakebed (Exhibit 15). The intermediate mariposa lily populations are already located at the outer edge of the existing inundation footprint of the lake. The additional inundation would be expected to be similar in duration to the current inundation of the lake edges; therefore, the effect of the additional inundation would be expected to be less than significant for the few intermediate mariposa lily locations affected. Suitable habitat for mud nama consists of areas that are intermittently inundated; the mud nama locations are in areas that are regularly inundated. Additional inundation would either have no effect or would be considered a

beneficial impact for this species. Overall, impacts on special status plant species as a result of the additional inundation would be considered less than significant and no mitigation would be required.

Special Status Wildlife Species

Invertebrates

Focused surveys for Quino checkerspot were conducted throughout the BSA in spring/summer 2022; no Quino checkerspot were observed (Psomas 2022b). Therefore, there would be no impact on this species and no mitigation would be required.

Focused surveys for Crotch's bumble bee were conducted throughout the BSA in summer 2024; one Crotch's bumble bee individual was observed (Psomas 2024a). Suitable habitat for this species is present throughout the BSA. A total of 52.66 acres (12.95 acres permanent; 39.58 acres temporary; 0.13 acre within the SCE realignment) of suitable habitat (i.e., coastal sage scrub, chaparral, grassland, woodland, and ornamental) for the Crotch's bumble bee would be removed to construct the Project (Table 17). This species is a Candidate for State listing; impacts on this species would be considered significant. Mitigation Measure #5 would require pre-construction surveys for Crotch's bumble bee, avoidance of active nest burrows during construction, and consultation with CDFW to obtain an Incidental Take Permit.

Monarch butterfly, a federally proposed Threatened species, was recorded as an incidental observation during the spring 2022 Quino checkerspot butterfly surveys and its hostplant, milkweed, was noted during spring botanical surveys. Monarch butterfly is not expected to overwinter in the BSA because the BSA is too far inland; therefore, the Project is not expected to impact an overwintering site and no mitigation would be required.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet). The additional inundation area would temporarily impact 7.74 acres of suitable habitat for Crotch's bumble bee (i.e., coastal sage scrub, chaparral, grassland, woodland, and ornamental) (Table 17). If the area where Crotch's bumble bees forage was inundated, it is assumed that they would forage on higher ground, and once the water subsided, foraging habitat would again be available to them. Because the inundation would only affect a strip of habitat up to two feet in elevation, and there is a substantial amount of habitat available adjacent to the additional inundation area, the inundation would be considered a less than significant impact on foraging and no mitigation would be required.

Fish

White sturgeon is stocked in Irvine Lake by OC Parks. The Project would dewater the lake prior to construction for a period of up to four years. Dewatering the lake would result in the loss of all non-native fish, including the white sturgeon. White sturgeon stocked in the lake are sterile individuals and isolated from naturally occurring populations; therefore, the loss of these individuals would not affect the viability of the species since these individuals are

not reproducing and were intended to be taken by angling. Therefore, the impact on white sturgeon would be considered less than significant and no mitigation would be required.

Santa Ana speckled dace does not currently occur in Santiago Creek and/or Irvine Lake. Therefore, there would be no impact on this species and no mitigation would be required.

If CDFW implements a translocation of Santa Ana speckled dace to an area along Santiago Creek upstream of Irvine Lake, the translocated individuals may or may not be successful (i.e., survive and reproduce). Following the translocation, CDFW would monitor the translocated individuals to determine whether they become an established self-sustaining population. If the translocated individuals are successful in maintaining their population, they could move downstream along Santiago Creek to the upstream (eastern) end of the BSA prior to the initiation of the Project. Santa Ana speckled dace would not be expected to enter Irvine Lake as their preferred habitat is streams; they do not occur in lakes (except at the confluence with the stream). However, while the lake is dewatered, a portion of the flow could act as a stream, which the dace could then occupy temporarily until the lake is refilled. Project intake pipelines for dewatering and bypass pipelines around the work area would all include fish screens. The potential that the Project would impact translocated Santa Ana speckled dace is considered low because: (1) the translocated dace may not survive until the Project begins; (2) the translocated dace may not move downstream into the lake area where the Project construction would be occurring; (3) the Project bypass pipelines and dewatering pipelines would include fish screens; and (4) the area where active construction would be occurring would be dry. Therefore, the potential impact on translocated Santa Ana speckled dace is considered less than significant, and no mitigation would be required.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet). The additional inundation area would increase the amount of habitat available for fish species. Therefore, the additional inundation would be considered a beneficial effect, and no mitigation would be required.

Amphibians

Focused surveys for the arroyo toad were conducted downstream of the dam in spring 2020 and upstream of Irvine Lake in 2022; no arroyo toads were observed (Psomas 2020a, 2022c). Therefore, there would be no impact on this species and no mitigation would be required. Focused surveys for the western spadefoot toad were conducted throughout the BSA in spring 2025; no western spadefoot toads were observed (Psomas 2025 [in preparation]). Therefore, there would be no impact on this species and no mitigation would be required.

Coast Range newt has potential to occur in the BSA. The Project would not impact breeding habitat for this species (i.e., stream habitat with sufficient water). However, this species uses upland habitats for foraging and aestivation. A total of 88.67 acres (14.67 acres permanent; 73.86 acres temporary; 0.14 acre within the SCE realignment) of suitable habitat for this species (i.e., coastal sage scrub, chaparral, grassland, riparian, woodland, and cliff) would be removed to construct the Project (Table 17). Although not formally covered, Coast Range newt also benefits from habitats conserved in the Reserve System. Due to the limited amount

of habitat loss relative to the availability of habitat for Coast Range newt in the region, and because there would be no impact on breeding locations, impacts on this species would be considered adverse but less than significant; no mitigation would be required.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet). The additional inundation area would temporarily impact 16.94 acres of suitable habitat for special status amphibian species (i.e., coastal sage scrub, chaparral, grassland, riparian, woodland, and cliff) (Table 17). Amphibians can occur in aquatic or upland habitat; therefore, the additional inundation is not expected to affect them. Therefore, the additional inundation would be considered less than significant, and no mitigation would be required.

Reptiles

Focused surveys for southwestern pond turtle were conducted throughout the BSA in summer 2024; no southwestern pond turtles were observed (Psomas 2024b). Therefore, there would be no impact on this species and no mitigation would be required.

Two-striped garter snake is known to occur in riparian and open water habitats along Santiago Creek both upstream and downstream of the dam (Psomas 2020a, 2022c). A total of 220.26 acres (1.78 acres permanent; 218.48 acres temporary) of suitable riparian, fluctuating shoreline, vegetated fluctuating shoreline, and open water habitat for this species would be removed to construct the Project (Table 17). Although not formally covered by the NCCP/HCP, two-striped garter snake benefits from habitats conserved in the Reserve System. Due to the limited amount of habitat loss relative to the availability of habitat for these species in the region, impacts on this species would be considered adverse but less than significant, and no mitigation would be required.

Orange-throated whiptail and coastal whiptail were incidentally observed along Santiago Creek during focused surveys (Psomas 2022c). Additionally, coast horned lizard, southern California legless lizard, California glossy snake, coast patch-nosed snake, and red diamond rattlesnake have potential to occur in habitats throughout the BSA. A total of 88.67 acres (14.67 acres permanent; 73.86 acres temporary; 0.14 acre within the SCE realignment) of suitable habitat for these species (i.e., coastal sage scrub, chaparral, grassland, riparian, woodland, and cliff) would be removed to construct the Project (Table 17). Of these species, coast horned lizard, orange-throated whiptail, coastal whiptail, and red diamond rattlesnake are Covered Species in the NCCP/HCP; upland habitats have been conserved in the Reserve System. Although not formally covered, southern California legless lizard, California glossy snake, and coast patch-nosed snake also benefit from habitats conserved in the Reserve System. Due to the limited amount of habitat loss relative to the availability of habitat for these species in the region, impacts on these species would be considered adverse but less than significant, and no mitigation would be required.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet). The additional inundation would temporarily impact up to 16.94 acres of habitat for special status reptile species (i.e., coastal sage scrub, chaparral, grassland, riparian, woodland, and cliff) in the additional inundation area (Table 17). If the area were inundated, there would

be no effect on two-striped garter snake, which could use the open water habitat. It is assumed that the other special status reptiles would move to higher ground, and once the water subsided, the habitat would again be available to them. Because the inundation would only affect a strip of habitat up to two feet in elevation, and there is a substantial amount of habitat available adjacent to the additional inundation area, the inundation would be considered a less than significant impact on special status reptiles and no mitigation would be required.

Birds

Focused surveys for southwestern willow flycatcher and western yellow-billed cuckoo were conducted in spring/summer 2022; neither southwestern willow flycatcher nor western yellow-billed cuckoo were observed (Psomas 2022e, 2022f). Therefore, there would be no impact on these species and no mitigation would be required.

The federally Threatened coastal California gnatcatcher is known to occur throughout the coastal sage scrub habitats in the BSA. One pair of gnatcatchers successfully nested downstream of Santiago Creek Dam and multiple coastal California gnatcatchers were observed in habitat around Irvine Lake, upstream of the dam (Exhibit 15; Psomas 2020b, 2022d, 2024a). Therefore, coastal California gnatcatcher presence should be assumed throughout coastal sage scrub habitats in the BSA. A total of 8.41 acres (3.95 acres permanent; 4.39 acres temporary; 0.07 acre within the SCE realignment) of suitable habitat for this species (i.e., coastal sage scrub) would be removed to construct the Project (Table 17). Additionally, during construction, this species would be disturbed by construction noise for up to 20 hours per day (including night work) periodically during the breeding season for approximately four years. During construction, jackhammering and concrete crushing would occur during demolition of the existing spillway and drilling into bedrock would occur to construct the new spillway. In the absence of noise minimization measures, all coastal sage scrub within 500 feet of construction activities would be indirectly affected by construction noise[16], with the most noise-intensive effects on coastal sage scrub occurring downstream of the dam. Any impact on coastal California gnatcatcher would be considered significant. This species is a Covered Species under the NCCP/HCP; therefore, take of coastal sage scrub is fully covered by participation in the NCCP/HCP for IRWD. Additionally, the NCCP/HCP requires standard construction minimization measures during removal of coastal sage scrub habitat to protect NCCP/HCP Covered Species (PDF-3). Implementation of Mitigation Measure #1 would ensure that IRWD's take is accounted for according to the NCCP/HCP.

The federally and state Endangered least Bell's vireo is known to occur in riparian habitats along Santiago Creek and the upstream edges of Irvine Lake (Exhibit 15; Psomas 2022e). Least Bell's vireo was absent downstream of the dam during the 2020 focused surveys (Psomas 2020c), but was incidentally observed downstream of the dam during the 2024 focused surveys for Crotch's bumble bee (Psomas 2024a); riparian habitat downstream of the dam is not as well-developed. Therefore, least Bell's vireo presence should be assumed throughout riparian habitats at the upper end of Irvine Lake and along Santiago Creek upstream of the lake; least Bell's vireo has potential to occur in riparian habitats downstream

[16] A detailed analysis of noise impacts on these sensitive habitat areas will be included in the Noise section of the Environmental Impact Report.

of the dam. A total of 36.73 acres (1.45 acres permanent, 35.28 acre temporary) of suitable riparian habitat for the least Bell's vireo would be removed to construct the Project (Table 17). Additionally, during construction, this species would be disturbed by construction noise for up to 20 hours per day (including night work) periodically during the breeding season for approximately four years. During construction, concrete crushing would occur in the staging area at the upstream end of Irvine Lake. If least Bell's vireo occurred downstream of the dam, they would also be subject to jackhammering, concrete crushing, and drilling into bedrock to demolish/construct the new spillway, as described above for coastal California gnatcatcher. In the absence of noise minimization measures, all riparian habitat within 500 feet of construction would be indirectly affected by construction noise[17]. Any impact on least Bell's vireo would be considered significant. The least Bell's vireo is a Conditionally Covered Species under the NCCP/HCP. Mitigation Measures #2 would ensure that riparian habitat impacted by the Project would be replaced at no less than a 1:1 ratio. Mitigation Measure #6 would require removal of riparian habitat outside the nesting season, implementation of appropriate noise minimization measures, and consultation with USFWS and CDFW.

The coastal cactus wren and Southern California rufous-crowned sparrow were observed in coastal sage scrub habitats and grasshopper sparrow was observed in grassland habitats in the BSA (Exhibit 15; Psomas 2020b, 2022d, 2022e). Additionally, loggerhead shrike and California horned lark have potential to occur in upland habitats throughout the BSA. A total of 47.85 acres (12.39 acres permanent; 35.38 acres temporary; 0.08 acre within the SCE realignment) of suitable habitat for these species (i.e., coastal sage scrub, chaparral, and grassland) would be removed to construct the Project (Table 17). Of these species, coastal cactus wren and Southern California rufous-crowned sparrow are Covered Species in the NCCP/HCP; upland habitats have been conserved in the Reserve System. Although not formally covered, loggerhead shrike, California horned lark, and grasshopper sparrow also benefit from habitats conserved in the Reserve System. Due to the limited amount of habitat loss relative to the availability of habitat for these species in the region, impacts on these species would be considered adverse but less than significant, and no mitigation would be required.

The yellow-breasted chat and yellow warbler were observed in riparian habitats in the BSA (Exhibit 15; Psomas 2022d, 2022e). A total of 36.73 acres (1.45 acres permanent; 35.28 acre temporary) of suitable habitat for these species (i.e., riparian) would be removed to construct the Project (Table 17). Although not formally covered by the NCCP/HCP, these species also benefit from habitats conserved in the Reserve System. Due to the limited amount of habitat loss relative to the availability of habitat for these species in the region, impacts on these species would be considered adverse but less than significant, and no mitigation would be required.

A pair of bald eagles, State Endangered and Fully Protected, was incidentally observed nesting in a canyon adjacent to the BSA during focused surveys conducted around Irvine Lake in 2022 (Exhibit 15, Psomas 2022d, 2022e). CDFW included the location on a map of breeding territories (1990 to 2016); therefore, this location has been known since at least

[17] A detailed analysis of noise impacts on these sensitive habitat areas will be included in the Noise section of the Environmental Impact Report.

2016. The 2022 nesting location was over 1,200 feet (0.22 mile) from the borrow site/staging area, which is the closest Project activity[18] and approximately 1.25 miles from Santiago Creek Dam, where construction would be concentrated. Therefore, the nest would not be expected to be directly or indirectly impacted by the construction activities or noise. However, the entire lake would be temporarily dewatered (312.11 acres of open water) and construction would affect a total of 183.53 acres within the lake (0.33 acre permanent; 183.20 acres temporary) that provide suitable foraging habitat for this species (i.e., open water, fluctuating shoreline, and vegetated fluctuating shoreline) to construct the Project (Table 17). During construction, the lake would be dewatered and fish would no longer be an available food source for this breeding pair. Waterfowl may also be reduced in numbers once the lake is drained, although they may still be present upstream and downstream of the impact area. Throughout the winter storm season, when the lake is functioning for flood control, open water may be available for a limited time following storms but would be kept in a dewatered condition throughout the construction period and fish would not be stocked. When the lake holds limited water following storms, it could be used by waterfowl. The temporary loss of the lake habitat over four years of construction may cause the bald eagles to leave Irvine Lake for the duration of construction. However, they (or a new pair) would be expected to reoccupy the lake following completion of the Project once the lake is restocked with fish. This impact would be considered significant. Mitigation Measure #7 would require consultation with the USFWS and CDFW to determine the appropriate monitoring strategy during construction.

White-tailed kite and American peregrine falcon were observed in the BSA during surveys. In addition, Cooper's hawk, ferruginous hawk (during winter and migration), golden eagle, prairie falcon, long-eared owl, and burrowing owl have potential to occur in the BSA for foraging. A total of 137.98 acres (14.73 acres permanent; 123.11 acres temporary; 0.14 acre within the SCE realignment) of suitable foraging habitat for these species (i.e., coastal sage scrub, chaparral, grassland, riparian, woodland, cliff, fluctuating shoreline, vegetated fluctuating shoreline, ornamental, and disturbed) would be removed to construct the Project (Table 17). However, during construction, the lake would be dewatered and an additional 128.58 acres of lake bottom (areas currently mapped as open water outside of the impact areas) would be temporarily available as foraging habitat for these species, though these areas may provide limited prey since there would not be any vegetation cover. The permanent loss of 14.73 acres of foraging habitat for these raptors would cumulatively contribute to the ongoing regional loss of foraging habitat for these species. Of these species, American peregrine falcon is a Covered Species, while golden eagle and prairie falcon are Conditionally Covered, by the NCCP/HCP; upland habitats have been conserved in the Reserve System. Although not formally covered, Cooper's hawk, ferruginous hawk, white-tailed kite, long-eared owl, and burrowing owl also benefit from habitats conserved in the Reserve System. Therefore, this impact would be considered adverse but less than significant because a substantial amount of foraging habitat for these species is available immediately adjacent to the Project in the Reserve System.

The Cooper's hawk, white-tailed kite, golden eagle, prairie falcon, American peregrine falcon, long-eared owl, and burrowing owl also have potential to nest within or adjacent to the BSA.

[18] The Federal Bald Eagle Act states that a permit to impact the nest would be needed if construction would be within 660 feet of an active nest.

Impacts on any active raptor nest (common or special status species) would be considered a violation of the MBTA and Sections 3503, 3503.5, and 3513 of the *California Fish and Game Code*. Additionally, these species could be disturbed by noise adjacent to construction areas. Standard pre-construction surveys and nesting bird protection would be implemented to ensure consistency with the MBTA and *California Fish and Game Code* (PDF-5). Therefore, impacts on nesting raptors would be less than significant assuming compliance with regulatory requirements.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet). The additional inundation would temporarily impact up to 17.41 acres of foraging and nesting habitat (i.e., coastal sage scrub, chaparral, grassland, woodland, cliff, and ornamental) for special status bird species in the additional inundation area (Table 17). If the area were inundated, it is assumed that special status birds would move to higher ground, and once the water subsided, the habitat would again be available to them. Because the inundation would only affect a strip of habitat up to two feet in elevation, and there is a substantial amount of habitat available adjacent to the additional inundation area, the inundation would be considered a less than significant impact on special status birds and no mitigation would be required.

The additional inundation areas would be expected to be inundated during the storm season, which is generally outside the peak bird breeding season (although there is some overlap in early spring). The inundation would be associated with natural storm events, which could lead to a natural loss of nests early in the spring. The potential inundation of nests is expected to be extremely limited because (1) it would only affect species nesting within two feet in elevation above the current maximum water line; (2) it would only affect species nesting in February and March; and (3) it would only occur approximately once every several years. Therefore, the effect on nesting birds would be expected to be less than significant and no mitigation would be required.

Mammals

Mountain lions are known to occur throughout the vicinity of the BSA and mountain lion sign (i.e., tracks) were observed downstream of Santiago Creek Dam during focused surveys. A total of 88.67 acres (14.67 acres permanent; 73.86 acres temporary; 0.14 acre within the SCE realignment) of suitable habitat for this species (i.e., coastal sage scrub, chaparral, grassland, riparian, woodland, and cliff) would be removed to construct the Project (Table 17). The mountain lion is proposed for State listing due to fragmentation of habitat that isolates populations. Although the Project would permanently impact 14.67 acres of habitat downstream of the dam along Santiago Creek, it would be in the same location as the existing dam structure; it would not create a new barrier to movement. Additionally, there is extensive habitat in the Reserve System immediately surrounding the Project site that would be available for use by mountain lion. Although mountain lion may avoid the dam area and borrow site/staging area during construction that occurs at night, it would be expected to move along the edge of the Project, using habitat not impacted by the Project, during construction. Therefore, the Project would not be expected to interfere with movement by mountain lions. It is possible that mountain lions may choose to move along the roads despite the construction, which would increase the potential for wildlife strikes along the roadways

at night. Speed limits and wildlife crossing signage would be posted along access roads (PDF-6). Therefore, the impact on wildlife movement would be less than significant.

Northwestern San Diego pocket mouse and San Diego desert woodrat may occur in the BSA. A total of 51.94 acres (13.22 acres permanent; 38.58 acres temporary; 0.14 acre within the SCE realignment) of suitable habitat for these species (i.e., coastal sage scrub, chaparral, grassland, woodland, and cliff) would be removed to construct the Project (Table 17). Additionally, vibration from construction could cause the collapse of pocket mouse burrows in the adjacent habitat as well as cause woodrats to flee their middens. Individuals could also potentially move through the construction area and be hit by construction vehicles. San Diego desert woodrat is a Covered Species in the NCCP/HCP; upland habitats have been conserved in the Reserve System. Although not formally covered, northwestern San Diego pocket mouse also benefits from habitats conserved in the Reserve System. Due to the limited amount of habitat loss relative to the availability of habitat for these species in the region, impacts on these species would be considered adverse but less than significant, and no mitigation would be required.

Six special status bat species have potential to forage in the BSA: pallid bat, pocketed free-tailed bat, big free-tailed bat, western red bat, western yellow bat, and western mastiff bat. A total of 137.98 acres (14.73 acres permanent; 123.11 acres temporary; 0.14 acre within the SCE realignment) of suitable foraging habitat for these species would be removed to construct the Project (Table 17). Many bat species prefer to forage over water. During construction, Irvine Lake (312.11 acres) would be dewatered and the creek would be routed around the construction area. Although this could create lower quality foraging habitat during construction, it is expected that open water (i.e., preferred foraging habitat) would be available upstream and/or downstream of the work areas during construction. These impacts would be considered adverse but less than significant because a substantial amount of foraging habitat for these species would continue to be available immediately adjacent to the Project in the Reserve System throughout the Project. Following completion of the Project, open water would again be available within Irvine Lake. Therefore, no mitigation would be required for the loss of bat foraging habitat.

Pallid bat, pocketed free-tailed bat, big free-tailed bat, western red bat, western yellow bat, and western mastiff bat also have potential to roost in the BSA. Bats may roost in the rocky outcroppings along Santiago Creek, in crevices of structures (e.g., dam structure, spillway and outlet tower, and dam keeper's house), or in large oak or sycamore trees in the BSA. A total of 3.57 acre (0.53 acre permanent; 2.99 acres temporary; 0.05 acre within the SCE realignment) of suitable tree roosting habitat would be removed to construct the Project (Table 17). This impact would be considered adverse but less than significant because a substantial amount of tree roosting habitat would continue to be available immediately adjacent to the Project in the Reserve System during the Project. A total of 0.52 acre (0.30 acre permanent; 0.21 acre temporary; 0.01 acre within the SCE realignment) of suitable cliff roosting habitat would be removed to construct the Project (Table 17). Additionally, during the project, a portion of the dam, spillway, outlet tower structure, and dam keeper's house that may be used by bats that roost in crevices would not be available for roosting. Construction activities could directly impact roosting individuals. Impacts on a maternal roost (i.e., where breeding occurs) or a communal roost would be considered to

meet the requirements of CEQA Guidelines Section 15380. Mitigation Measure #8 would require pre-construction surveys and bat exclusion.

The additional inundation that would occur infrequently as a result of raising the spillway would be temporary and would occur near the existing waterline (i.e., within two feet). The additional inundation would also temporarily impact up to 16.94 acres of habitat for special status mammals (i.e., coastal sage scrub, chaparral, grassland, riparian, woodland, and cliff) in the additional inundation area (Table 17). This may increase the amount of preferred foraging habitat (i.e., open water) for bat species. If the area were inundated, it is assumed that terrestrial mammals would move to higher ground, and once the water subsided, the habitat would again be available to them. Because the inundation would only affect a strip of habitat up to two feet in elevation, and there is a substantial amount of habitat available adjacent to the additional inundation area, the inundation would be considered a less than significant impact on special status mammals and no mitigation would be required.

4.2.6 INDIRECT IMPACTS

Increased Inundation

Lake level depends on rainfall of the season, intensity of storm events, and rate of releases. Following the Project, dam operations would not substantially change; the way that water would be held in the reservoir throughout the year would be expected to be the same as the existing conditions. The Project would raise the spillway height by six feet, which is two feet above the current maximum water storage elevation with flashboards installed. Thus, the area between the 795.9-foot elevation contour and the 797.9-foot elevation around the perimeter of Irvine Lake (referred to as "additional inundation area") would be infrequently inundated for a period of up to approximately 45 days (Exhibit 11). In the last 20 years, Irvine Lake has been at the maximum capacity of 795.9-foot elevation four times. Approximately the same frequency would be expected following implementation of the Project, but it would depend on frequency and intensity of storms and operations of the lake.

When the lake is at the maximum elevation, a narrow strip of riparian vegetation would be inundated infrequently (9.66 acres of riparian; Exhibit 11; Table 17). These areas are dominated by mule fat and willows, which have a high to very high tolerance to inundation, assuming shoots (i.e., trunks, stems, leaves) are not fully submerged (Glentz et al. 2006, Tallent-Halsell and Walker 2002, Francis et al. 2005, Good et al. 1992). Glentz et al. (2006) found that willows can withstand a flooding duration for as much as 40% of the growing season (spring/summer); the BSA receives most rainfall outside the growing season in the winter and early spring when willows are dormant. Therefore, the infrequent additional inundation is not expected to affect the riparian vegetation that currently exists around the lake. While the OHWM may change after raising the spillway, creating some additional jurisdiction, riparian vegetation and hydric soils are not expected to be created where they do not currently occur based on the infrequency of the additional inundation. Jurisdictional areas within Irvine Lake, Santiago Creek, and Drainages 4, 5, 6, 7, 9, 12, and 15 fall within the additional inundation area (Exhibits 12, 13, and 14).

When the lake is at the maximum elevation, a narrow strip of upland vegetation would be inundated infrequently (3.36 acres coastal sage scrub, 0.18 acre chaparral, and 0.50 acre of

coast live oak woodland; Exhibit 11, Table 17). Species in these habitat types are not adapted to wet conditions and could be affected by extended inundation (i.e., longer than one week). Normally, shrub and tree roots get air from pore spaces in the soil, but when soils are inundated, air spaces are filled with water and roots experience anaerobic conditions. This can result in a delay in leafing out, branch dieback, smaller than normal leaves, or wilted leaves. Once the inundation has subsided, shrubs and trees should resume normal growth and their growth may catch up by spring or summer. However, if a flooded shrub/tree does not resume normal growth, the roots may have been damaged by the inundation (Cregg 2013). The infrequent additional inundation affects two feet in elevation, which may be several feet wide in flat areas, but less than a foot on steeper slopes. The upland habitat types within the additional inundation areas are mostly located on slopes, which means a narrower area of upland vegetation would be affected around most of the lake (Exhibit 11). Therefore, if a shrub/tree is affected, it would be expected to only affect a few shrubs or a small portion of the roots and associated canopy of trees. Potential effects on chaparral due to infrequent additional inundation would be considered adverse but less than significant in relation to the total amount of chaparral vegetation available in the Project region. Coastal sage scrub and oak woodlands are Covered Habitats under the NCCP/HCP; upland habitats have been conserved in the Reserve System. Take of coastal sage scrub is fully covered by participation in the NCCP/HCP for IRWD. Implementation of Mitigation Measure #1 would ensure that IRWD's take for its share of the impacts is accounted for according to the NCCP/HCP.

When the lake is at the maximum elevation, a narrow strip of nonnative vegetation would be inundated infrequently (3.23 acres grassland [annual grassland, ruderal] and 0.47 acres of ornamental; Exhibit 11, Table 17). Like the upland vegetation, these vegetation types may be adversely affected by the infrequent additional inundation, however, these vegetation types are considered of low biological value. Therefore, inundation effects on this vegetation would be considered less than significant and no mitigation would be required.

Although infrequent additional inundation would not directly remove vegetation from the BSA, habitat within the inundation area would be unavailable to most wildlife during the infrequent inundation. If infrequent additional inundation occurred during the breeding season, it could flood burrows and nests causing them to fail. However, it is anticipated that most inundation events would occur during the storm season (i.e., October 1 to April 15), which is outside the peak breeding season for most wildlife. Following each inundation event, the habitat would again be available for use with areas along the periphery becoming available most quickly. Although infrequent additional inundation effects would be considered adverse, they would affect a limited amount of habitat (17.41 acres) compared to the amount of habitat available in the Project region. Therefore, inundation effects would be considered adverse but less than significant.

Dewatering of the Lake

During the Project, the lake would be dewatered for a period of up to four years. When a lake is dewatered, water is not available to seep through the ground to recharge the underground aquifer and the water table under and around the edge of the lake may drop. If this occurs, it could affect the riparian vegetation around the edge of the lake. However, during the winter storm season, precipitation is expected to recharge or partially recharge the underground

aquifer/water table. The water table can also recharge through the areas surrounding the lake that are outside the dewatered area, including through several drainages flowing into the lake and sheet flow from the southeastern and eastern sides of the lake. The majority of riparian scrub/woodland vegetation occurs at the upstream end of the lake, upstream of the work area, where recharge would still be occurring naturally (since it is upstream of the area that would be dewatered). Considering both precipitation and recharge from surrounding areas, lowering of the water table is not expected to substantially affect riparian scrub/woodland vegetation around the edges of the lake. Therefore, this impact is considered adverse but less than significant, and no mitigation would be required.

Noise Impacts

The BSA includes some periodic noise events, including consistent low helicopter flights and landings and periodic special events in the adjacent park (e.g., concerts). Noise levels in the BSA would increase substantially over present levels during construction of the Project due to construction vehicles, demolition of the existing spillway, concrete crushing, and drilling into bedrock to secure the new spillway and dam embankment. A detailed noise analysis has been prepared for the Project. During construction, temporary noise impacts have the potential to disrupt foraging, nesting, roosting, and denning activities for a variety of wildlife species. These impacts are considered adverse, but not significant for most wildlife species, because the Project would not impact a substantial population of these species. Noise from construction activities may cause birds adjacent to the work area to abandon their territory or may discourage individuals from selecting habitat adjacent to the work area due to construction noise and human activity. Construction activities could increase noise in the immediate vicinity and could interfere with communication between a pair that could affect their nest success. Noise impacts would be considered significant for the coastal California gnatcatcher, least Bell's vireo, and other nesting raptors. With the implementation of standard NCCP/HCP construction minimization measures and Mitigation Measure #6, indirect noise impacts on the coastal California gnatcatcher and least Bell's vireo would be considered less than significant. Additionally, implementation of standard pre-construction surveys and nesting bird protection would ensure consistency with the MBTA and *California Fish and Game Code* (PDF-5). Therefore, indirect noise impacts on nesting birds and raptors would be less than significant.

Increased Dust and Urban Pollutants

Grading activities would disturb soils and result in the accumulation of dust on the surface of the leaves of trees, shrubs, and herbs. The respiratory function of the plants in the area would be impaired when dust accumulation is excessive. This indirect effect of construction of the Project on the native vegetation in the immediate vicinity of the construction area is considered adverse but less than significant because it would not substantially reduce plant populations in the region. Additionally, it is assumed that a water truck would be used to reduce dust during construction as required for air quality requirements. Therefore, no mitigation would be required.

During construction, excess silt, petroleum, or chemicals on the soil surface within the construction area could be washed into drainages (including Santiago Creek) and Irvine Lake during storms and may affect areas downstream of the Project. Adverse effects on water

quality could indirectly impact species that use riparian areas within the watershed by affecting the food web interactions (e.g., abundance of insects or other prey) or through biomagnification (i.e., the buildup of chemicals in body tissues to toxic levels in higher trophic levels). To be compliant with regulatory requirements, the Project will obtain a State Water Resources Control Board's General Permit for Storm Water Discharge Associated with Construction Activity (Construction Activities General NPDES Permit), which will include development of a Storm Water Pollution Prevention Plan and provisions for the implementation of Best Management Practices and erosion control measures to prevent the runoff of toxins, chemicals, petroleum products, or other elements that might degrade water quality. Assuming compliance with standard regulatory requirements, impacts on water quality would be less than significant and no mitigation would be required.

No dust or urban pollutants would be expected during operation of the Project. Therefore, there would be no long-term impact and no mitigation would be required.

Invasive Exotic Plant Species

No landscaping is anticipated as part of the Project. Therefore, there would be no effect on adjacent habitats due to the planting of non-native, invasive plant species.

Construction activities create disturbance, which in turn provides a place for non-native weedy species to spread. Additionally, construction equipment can introduce non-native weed seeds to the area if equipment is not properly cleaned. Weeds from the construction may then spread to adjacent habitat areas (including adjacent Reserve areas), which would degrade habitat quality for native species. In addition to the negative effects on habitat quality, non-native weeds can also increase the potential for large fires to spread. Specifications for the Project will use BMPs to prevent the spread of weed seeds and requires the use of a native seed mix for hydroseeding areas disturbed by construction activities. Invasive species observed during construction would be treated during and following construction (PDF-9). Therefore, impacts as a results of invasive exotic plant species would be considered less than significant.

Night Lighting

Night lighting may impact the behavioral patterns of nocturnal and crepuscular (i.e., active at dawn and dusk) wildlife adjacent to night lighting. Of greatest concern is the effect on small, ground-dwelling animals that use the darkness to hide from predators and bats, owls, and mountain lion, which are specialized night foragers. Following the Project, the spillway and outlet tower would not include night lighting; therefore, there would be no impact due to night lighting during operation of the Project. However, construction activities would include regular night work; therefore, night lighting during construction could negatively impact nocturnal and crepuscular wildlife species within the BSA as well as in the surrounding adjacent open space. Specifications for the Project will be used to minimize night lighting on sensitive habitat areas (PDF-7).

Human Activity

The Project is not expected to increase human activity during operation. Therefore, there would be no long-term impact and no mitigation would be required.

During construction, there would be an increase in human activity (i.e., vehicle and foot traffic), which would increase the disturbance of natural open space adjacent to construction areas. Human disturbance could disrupt normal foraging and breeding behavior of wildlife adjacent to construction areas, diminishing the value of the habitat. Standard pre-construction surveys and nesting bird protection would ensure nesting birds and raptors would be protected from disturbance (PDF-5). Additionally, all construction personnel would be trained on the environmental sensitivity of the area prior to construction (PDF-1) and the Project limits would be clearly delineated (PDF-2). With implementation of these measures, the increased human activity would be less than significant.

Increased Wildfire Risk

Fires are a natural part of the landscape in California; however, with the changing weather patterns brought by climate change, the fire season is coming earlier and ending later than in the past (USFS 2018). In the last five years (October 2019 – October 2023), there have been 6,884 wildfires that have burned 1,570,571 acres in California (CalFire 2023). Drought or extended periods of low rainfall can dry out fuel, increasing its risk of burning. Periods of high rainfall decrease fire risk because there is more moisture in the vegetation; however, years of high rainfall increase the fuel load with growth of vegetation and weeds. In the Project region, Santa Ana wind conditions also increase the risk of fire with dry, gusty winds (CalFire 2023). According to the National Park Service, approximately 85 percent of wildfires are caused by humans. Human-caused wildfires are due to campfires left unattended, the burning of debris, equipment use and malfunctions, negligently discarded cigarettes, and intentional acts of arson (NPS 2022). The location of the Project is an important factor in understanding the extent of wildfire risk and how much potential for damage there is if a fire starts. Risk is higher when there are hot temperatures, low humidity, and high winds (i.e., "red flag warning" weather conditions). Risk is also higher near dry, ignitable vegetation (e.g., coastal sage scrub, chaparral, grassland, and ruderal), and hills or mountainous topography (Lordson 2020). Public Resources Code Sections 4427, 4428, 4431, and 4442 prohibit the use of combustion engines near forest, brush, or grass at any time of year when ground litter or vegetation would sustain the spread of fire. A detailed wildfire analysis has been prepared for the Project. During construction, construction equipment or personal vehicles have potential to accidentally ignite vegetation, starting a wildfire. If not contained quickly, the fire could spread through adjacent habitat areas, damaging the NCCP/HCP Reserve. The loss of habitat may affect listed species (e.g., coastal California gnatcatcher). All construction personnel would be trained on the environmental sensitivity of the area prior to construction (PDF-1) and the Biological Monitor would be present during vegetation clearing (PDF-3). Therefore, the increased fire risk would be considered less than significant.

5.0 MITIGATION MEASURES

This section focuses on the development of mitigation measures for those impacts of the Project found to be significant or potentially significant. Strategies to mitigate each impact to a less than significant level are identified and described in the following section. Consistency with the NCCP is discussed in Section 6.0.

5.1 MITIGATION MEASURE #1: COASTAL SAGE SCRUB AND COASTAL CALIFORNIA GNATCATCHER

Potential direct and indirect impacts on coastal sage scrub and coastal California gnatcatcher are fully mitigated through IRWD's participation and contribution in the NCCP/HCP Mitigation Program. This participation not only provides mitigation for coastal sage scrub and the coastal California gnatcatcher, but also other Covered Species and Covered Habitats. IRWD will mitigate for impacts on coastal sage scrub and coastal California gnatcatcher through a combination of the following, as approved by USFWS and CDFW: (1) use of IRWD's NCCP/HCP take allocation at a 1:1 ratio for impacted coastal sage scrub; (2) restoration of coastal sage scrub habitat at a minimum 1:1 ratio in areas temporarily disturbed by construction including weeding and three years of restoration monitoring; and/or (3) restoration of coastal sage scrub habitat at an on-site or off-site location at a minimum 1:1 ratio, as described in a Habitat Mitigation and Monitoring Plan (HMMP) in order to preserve IRWD's remaining NCCP/HCP take allocation (if desired by IRWD).

If a coastal sage scrub habitat establishment program is selected to mitigate for all or a portion of the impacts, IRWD will prepare a Coastal Sage Scrub HMMP and submit it to the resource agencies for review and approval prior to the initiation of construction activities. The Coastal Sage Scrub HMMP will include the following items: (1) responsibilities and qualifications; (2) performance criteria and contingency planning; (3) site selection; (4) seed materials procurement; (5) wildlife surveys and protection; (6) site preparation and plant materials installation; (7) schedule; (8) maintenance program; (9) monitoring program; and (10) long-term preservation. IRWD will retain a qualified Restoration Ecology to prepare the Coastal Sage Scrub HMMP and will retain a qualified Restoration Contractor to implement the HMMP. IRWD will be responsible for implementing the Coastal Sage Scrub HMMP and ensuring that the mitigation program achieves the approved performance criteria.

5.2 MITIGATION MEASURE #2: RIPARIAN VEGETATION AND JURISDICTIONAL PERMITTING

Before the start of construction, IRWD will obtain all necessary permits for impacts to USACE, CDFW, and/or RWQCB jurisdictional areas and will determine the compensatory mitigation needed for the loss of jurisdictional waters and wetlands. Potential compensatory mitigation options will include one or a combination of the following, as determined through consultation with the above-listed resource agencies: (1) establishment of riparian habitat (on site or off site) at a minimum 1:1 ratio for impacted jurisdictional areas; (2) payment to a resource agency-approved mitigation bank or regional riparian enhancement program (e.g., invasive species removal) at a minimum 1:1 ratio for impacted jurisdictional areas;

and/or (3) preservation of off-site riparian habitat on IRWD lands at a minimum 1:1 ratio for impacted jurisdictional areas.

If in-lieu mitigation fees are required, IRWD will pay the in-lieu mitigation fee before the start of construction to a mitigation bank/enhancement program for the replacement of impacted jurisdictional resources.

If a riparian habitat establishment program is selected to mitigate for all or a portion of the impacts, IRWD will retain a qualified Restoration Ecologist to prepare a Riparian HMMP and submit it to the resource agencies for review and approval prior to the initiation of construction activities. The Riparian HMMP will include the following items: (1) responsibilities and qualifications; (2) performance criteria and contingency planning; (3) site selection; (4) seed materials procurement; (5) wildlife surveys and protection; (6) site preparation and plant materials installation; (7) schedule; (8) maintenance program; (9) monitoring program; and (10) long-term preservation. IRWD will retain a qualified Restoration Contractor to implement the HMMP. IRWD will be responsible for implementing the Riparian HMMP and ensuring that the mitigation program achieves the approved performance criteria.

5.3 MITIGATION MEASURE #3: TREE SURVEY/REPLACEMENT

Before the start of construction, IRWD will retain a qualified Biologist or Certified Arborist to conduct a tree survey to identify the location and health of western sycamore trees within 100 feet of the Project impact area. To the extent practicable, temporary impact areas will be revised to avoid and minimize effects on western sycamore trees. Standard tree protection measures to fence western sycamores will be recommended for trees within or near the work area (PDF BIO-4).

Any western sycamores greater than four inches diameter at breast height that are removed by construction will be replaced at no less than a 1:1 ratio. Trees with a diameter at breast height (dbh) of greater than 4 up to 8 inches will replaced at a 1:1 ratio with a minimum container size of 15 gallons. Trees with a dbh of greater than 8 inches up to 16 inches will be replaced at a 1:1 ratio with a minimum container size of 25 gallons (i.e., 24-inch box). Trees with a dbh of greater than 16 inches up to 24 inches will be replaced at a 3:1 ratio with a minimum container size of 25 gallons (i.e., 24-inch box). Trees with a dbh of greater than 24 inches up to 36 inches will be replaced at a 5:1 ratio with a minimum container size of 25 gallons (i.e., 24-inch box). Trees with a dbh of greater than 36 inches will be replaced at a 10:1 ratio with a minimum container size of 25 gallons (i.e., 24-inch box). The replacement trees will be replaced either on-site or off-site in a location with appropriate microclimate conditions. The replacement trees will be incorporated into the Coastal Sage Scrub HMMP or Riparian HMMP (described above).

5.4 MITIGATION MEASURE #4: SPECIAL STATUS PLANT SPECIES

A. Pre-construction Surveys

During the peak blooming season prior to the initiation of construction (within the same year or the spring/summer prior), IRWD will retain a qualified Botanist to conduct a pre-construction focused survey for mud nama. Although not required, the pre-construction survey will also include intermediate mariposa lily, many-stemmed dudleya, and Coulter's matilija poppy to minimize impacts on these species. The pre-construction survey will focus on these species in the general locations where they were previously observed within the impact area, including a 100-foot survey buffer. The Botanist will record special status plant locations within the impact area and within 100 feet of the impact area using GPS and will clearly mark locations with pin flags or lathe and flagging. The Botanist will meet in the field with IRWD to discuss whether avoidance of these locations would be feasible (e.g., whether they could be protected within the temporary impact areas).

No compensatory mitigation will be required if the locations of intermediate mariposa lily,[19] many-stemmed dudleya, and Coulter's matilija poppy cannot be avoided. However, IRWD will notify the Natural Communities Coalition (NCC) and allow the NCC to collect seed and/or salvage special status plants that will be impacted by the Project. Seed collection/salvage will be coordinated so that it does not delay the construction schedule.

Compensatory mitigation will be required if more than 10 percent of the mud nama locations mapped in 2022 will be impacted, as described below under Mitigation Measure #4B.

Following the pre-construction survey and field meeting with IRWD, the Botanist will prepare a Pre-construction Special Status Plant Survey Report to document the results of the pre-construction surveys and will document the special status plant locations that will be avoided during construction. The Botanist will calculate the percent of the mud nama population that will be impacted by comparing the amount of mud nama within the construction impact area to the mud nama locations mapped in 2022. The report will also document that the final engineering plans, coupled with construction avoidance areas, will impact less than 50 percent of the mud nama population mapped in 2022.

After the field meeting with IRWD, the Botanist will work with IRWD/Contractor to clearly mark the locations that will be avoided during construction with lathe and flagging, orange snow fencing, stakes and rope, or other suitable fencing until the initiation of construction. During construction, the Biological Monitor will ensure that these areas are protected during construction as described below under Mitigation Measure #4C.

[19] The NCCP/HCP covers impacts on this species up to 20 individuals; if more than 20 individuals would be impacted, additional consultation with the resource agencies would be required. However, this is not anticipated to be necessary because only six individuals have been observed in the BSA during focused surveys and only one individual is located in the impact area.

B. Compensatory Mitigation for Mud Nama

As described under Mitigation Measure #4A, if compensatory mitigation is required for mud nama (i.e., more than 10 percent of the mud nama locations mapped in 2022 will be impacted by the Project), IRWD will retain a qualified Restoration Biologist to prepare a detailed Mud Nama Mitigation Plan. The Plan will describe collection of seed, salvage of individuals, salvage of soils (i.e., seed bank), and establishment of a new on-site location that will replace the area of mud nama impacted at a minimum 1:1 ratio (i.e., 1 acre impacted to 1 acre replaced). The on-site mitigation areas will provide similar microhabitat, including similar soils and elevation, to provide similar inundation frequency to current conditions. The Mud Nama Mitigation Plan will include the following topics: (1) responsibilities and qualifications of the personnel to implement and supervise the plan; (2) mitigation site selection criteria; (3) site preparation and planting implementation, including pilot studies (if needed); (4) implementation schedule; (5) maintenance plan/guidelines; (6) monitoring plan; (7) performance criteria and contingency planning; and (8) long-term preservation. IRWD will implement the Plan.

IRWD will retain a qualified Restoration Biologist/Seed Collector to collect seed, salvage individuals, and salvage soils (i.e., seed bank) from the mud nama during the spring/summer prior to impacts upon this plant. IRWD will ensure that the seed/salvaged individuals/soil will be stored by a qualified Seed Collector in appropriate conditions to maintain the viability of the seed to be used in the implementation of the Mud Nama Mitigation Plan.

C. Biological Monitoring

Before the start of construction, IRWD will retain a qualified Biological Monitor to confirm that the special status plant locations to be avoided are clearly marked with lathe and flagging, orange snow fencing, stakes and rope, or other suitable fencing. The Biological Monitor will post signs to indicate each location as an "Environmentally Sensitive Area" and that no work activities may occur within the fencing. The Biological Monitor will conduct a WEAP training regarding the importance of Environmentally Sensitive Areas. Once Project activities begin, the Biological Monitor will check the fencing/signage weekly to ensure that it stays in place throughout construction activities and will notify IRWD and the construction contractor immediately if the fencing/signage needs to be repaired.

5.5 MITIGATION MEASURE #5: CROTCH'S BUMBLE BEE

If CDFW determines that listing of the Crotch's bumble bee as threatened or endangered under the California Endangered Species Act is not warranted prior to or during implementation of the Project, this measure will not be required.

Until CDFW makes a determination, or if CDFW determines that listing of the Crotch's bumble bee as threatened or endangered under the California Endangered Species Act is warranted, the following measures will be required.

A. Incidental Take Permit/Compensatory Mitigation

IRWD will obtain an Incidental Take Permit (2081) prior to removal of suitable habitat for Crotch's bumble bee. IRWD will consult with CDFW to determine the appropriate mitigation to compensate for loss of floral resources associated with the species at a minimum 1:1 ratio of suitable habitat impacted (i.e., 1 acre impacted to 1 acre compensated). Potential compensatory mitigation options include on-site revegetation of temporarily disturbed areas using a seed mix of species preferred by Crotch's bumble bee at a minimum 1:1 ratio of temporarily impacted areas; payment of an in-lieu mitigation fee to an approved mitigation bank at a minimum 1:1 ratio of permanently impacted areas; long-term preservation of on-site or off-site habitat at a minimum 1:1 ratio of permanently impacted areas; or another strategy as approved by CDFW. Mitigation provided for under Mitigation Measure #1 (Coastal Sage Scrub) may be used towards mitigation for Crotch's bumble bee.

B. Pre-construction Survey

Prior to vegetation clearing or other ground-disturbance during each year of Project construction, IRWD will retain a qualified Biologist to conduct pre-construction focused surveys for active nests of Crotch's bumble bee following the most current CDFW guidelines[20] within 100 feet of Project impact areas with suitable habitat for Crotch's bumble bee. According to current guidelines (CDFW 2023), the Biologist will conduct three visual surveys during the species' active period (i.e., April to August). The timing between each visual survey may be reduced to accommodate the construction schedule, as long as the first and last survey are conducted at least one week apart during the active period.

If no active nests of Crotch's bumble bee are observed, vegetation clearing, grading, and ground-disturbance may proceed.

If a ground nest is observed, it will be protected in place until it is no longer active as determined by the qualified Biologist retained by IRWD. IRWD will implement applicable protective measures from the Incidental Take Permit for the species (see Mitigation Measure 5A). Potential protective measures may include protective buffers coupled with biological monitoring to avoid take of an active ground nest. The protective buffer will be determined by the Biologist conducting the pre-construction survey, or as designated in conditions in the Incidental Take Permit.

IRWD will ensure that a Letter Report is prepared to document the results of the pre-construction survey and will provide the letter to CDFW within 30 days of the completion of the survey.

[20] The current guidelines for this species are CDFW 2023; guidelines may be updated as more is learned about this species' biology.

C. Biological Monitor

Biological monitoring for Crotch's bumble bee will follow the most current CDFW guidelines[21] at the time of construction. According to current guidelines (CDFW 2023), IRWD will retain a Biological Monitor to be present onsite during vegetation clearing and/or ground-disturbing activities that take place during the Crotch's bumble bee queen flight period (i.e., February to March), colony active period (i.e., April to August), or gyne flight period (i.e., September to October). No biological monitoring will be required for vegetation clearing or ground-disturbance that occurs from November to January.

If a ground nest of Crotch's bumble bee is observed during the monitoring, it will be protected in place until it is no longer active, as determined by the qualified Biologist retained by IRWD. IRWD will also implement applicable protective measures from the Incidental Take Permit for the species (see Mitigation Measure 5A). If establishment of a protective and/or avoidance of the nest is not feasible, IRWD and its qualified Biologist will consult with CDFW regarding potential encroachment into the protective buffer that may result in take of Crotch's bumble bee pursuant to Mitigation Measure #5A.

5.6 MITIGATION MEASURE #6: LEAST BELL'S VIREO

IRWD will consult with USFWS and CDFW under Section 7 of FESA and Section 2080.1 of the California Fish and Game Code to approve the mitigation approach and whether NCCP/HCP Conditional Coverage would be extended to least Bell's vireo based on the measures below.

A. IRWD will obtain concurrence from USFWS and CDFW that the riparian mitigation described in Mitigation Measure #2 will provide appropriate compensatory mitigation for the loss of riparian habitat.

B. To the extent feasible, removal of riparian habitat will be conducted during the non-breeding season (i.e., September 16 to March 14) in order to minimize direct impacts on nests of least Bell's vireo. IRWD will retain a qualified Biologist to monitor vegetation clearing of riparian habitat.

C. Before starting construction each spring, IRWD will retain qualified Biologist to survey all habitat within 500 feet of the construction limits for the presence of least Bell's vireo. The Biologist will map any active nests/territories as Environmentally Sensitive Areas on an aerial photograph. IRWD will also ensure that the Biologist prepares a Letter Report and that it is submitted to USFWS and CDFW to document the results of the pre-construction survey within 30 days of completion of the survey.

D. IRWD will retain a qualified Biologist to conduct weekly focused surveys during construction to update the location of active least Bell's vireo territories. The Biologist will map new territories as Environmentally Sensitive Areas and will remove inactive Environmentally Sensitive Areas from the map. Once construction is in progress, IRWD will provide Weekly Reports to USFWS and CDFW.

[21] The current guidelines for this species are CDFW 2023; guidelines may be updated as more is learned about this species' biology.

E. IRWD will retain a qualified Biologist to establish a 500-foot protective buffer is around each least Bell's vireo territory identified during pre-construction or weekly surveys. The Biologist will verify that occupied riparian habitat is be protected with lathe and rope, orange snow fencing, or other suitable fencing to provide an adequate buffer from construction work. The Biologist will post signs to indicate that the area is an "Environmentally Sensitive Area" and that no work activities may occur within the fencing. The Biologist will conduct training to educate workers on the importance of Environmentally Sensitive Areas.

F. If construction activities need to occur within 500 feet of an active least Bell's vireo territory, IRWD will consult with USFWS and CDFW to determine an appropriate noise reduction strategy. Appropriate noise reduction measures may include, but are not limited to, specifications for equipment type, siting of equipment, and temporary noise barriers. IRWD will retain a qualified Biologist to monitor the installation of any noise reduction measures.

G. IRWD will retain a qualified Biologist to conduct daily monitoring when construction activities are conducted within 500 feet of an active least Bell's vireo territory or until the Biologist determines that the individuals are not being impacted by the noise (i.e., the noise measures are established and birds are acclimated to the activities).

5.7 MITIGATION MEASURE #7: BALD EAGLE

IRWD will consult with USFWS and CDFW with regard to bald eagle to determine whether any regulatory approval is necessary to comply with the California Endangered Species Act and the federal Bald Eagle Act. Because there would be no direct take of a nest, an informal consultation may be sufficient, but this approach will be confirmed by USFWS and CDFW.

USFWS and CDFW will review and approve the monitoring strategy to be used during construction. IRWD will retain a qualified Biologist to visit the bald eagle nest multiple times over the course of the breeding season to determine whether the nest is active and/or to determine the stage of nesting. The Biologist will conduct the first visit in early March to determine whether the nest is active. The Biologist will conduct the second visit in late March or April to confirm the nesting stage (i.e., eggs/young), or to confirm that the nest is still inactive. If the nest is not active during the first two visits, no additional surveys will be needed. However, if the nest is active, the Biologist will conduct weekly surveys from five weeks post-hatching continuing weekly until the young fledge or until May 15, whichever comes last. The Biologist conducting the surveys will complete the California Bald Eagle Nesting Territory Survey Form to document the survey results each year. IRWD will ensure that the form is submitted to USFWS and CDFW by September 1 of each year.

5.8 MITIGATION MEASURE #8: PRE-CONSTRUCTION BAT SURVEYS

IRWD will retain a qualified Biologist to conduct a pre-construction roosting bat survey (including both day and evening efforts) before construction begins. The day survey will involve inspection of the structures within the impact area to look for signs of bat roosting. The evening survey will involve monitoring each potential roost site for evening emergence, conducting exit counts, and acoustic monitoring (from a half an hour before sunset to no greater than three hours after sunset) near potential roosts within the impact area. If the

Biologist determines that bats are actively roosting onsite, IRWD will retain a qualified Biologist to prepare a Project-specific Bat Roost Minimization Plan (BRMP) and will implement the plan. The BRMP will include relevant avoidance and minimization measures based on survey results. If tree roosting bat species are found to be both foraging and potentially roosting onsite, IRWD will conduct tree removal only during the non-maternity season (September 1 through March 31). When potentially-occupied roost trees are removed, IRWD will implement a phased tree removal method (i.e., leaving the felled tree on the ground for 24-48 hours after the felling to allow any tree-roosting bats to leave). IRWD will avoid all Project structures proposed for demolition that support an active day-roost until either the roost is no longer active, as determined by a qualified Biologist, or until the occupants can be humanely evicted as described in the BRMP. IRWD will retain a qualified Biologist to implement bat eviction during the fall months outside of the bat maternity season (i.e., September 1 through November 30).

6.0 CONSISTENCY WITH THE NCCP/HCP

6.1 CONSISTENCY WITH NON-RESERVE OPEN SPACE POLICIES

The Project site is in a Non-Reserve Open Space area as defined by the NCCP/HCP Implementation Agreement, which includes development of infrastructure within the Reserve System in accordance with the provisions of Chapter 5.3, 5.9, and 5.11 of the NCCP/HCP and 5.3.3 of the Implementation Agreement.

Santiago Creek Dam is a permitted existing use under the NCCP/HCP. No amendments to the NCCP/HCP will be required for constructing infrastructure facilities so long as amended infrastructure plans do not result in incidental take beyond that described and permitted by the NCCP/HCP.

Recommended Action

See Mitigation Measure #1.

6.2 CONSISTENCY WITH COASTAL SAGE SCRUB TAKE AUTHORIZATION

Under the NCCP/HCP, IRWD is allotted up to 87 acres of take (60 within the Reserve System and 27 outside the Reserve System); this Project may use credits from within the Reserve System. IRWD merged with the Santiago County Water District, which was allotted 9 acres within the Reserve System, bringing the total allotted for IRWD to 96 acres (69 acres within the Reserve System and 27 acres outside the Reserve System). As of March 2025, IRWD has approximately 44 acres within the Reserve remaining in their allocation.

Per Section 5.11 of the NCCP/HCP, infrastructure is an existing use that is allowed within the Reserve. The Project would remove 8.41 acres of coastal sage scrub habitat (3.95 acres permanent; 4.39 acres temporary; 0.07 acre within the SCE realignment). Coastal sage scrub vegetation types that would be impacted include sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote brush scrub, and disturbed floodplain sage scrub. Raising the spillway would also temporarily impact 3.36 acres within the additional inundation area. Coastal sage scrub in the additional inundation area includes sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote brush scrub, southern cactus scrub, and disturbed southern cactus scrub. Take of coastal sage scrub is fully covered by IRWD's participation in the NCCP/HCP.

The NCCP/HCP requires avoidance and minimization measures during removal of coastal sage scrub habitat to protect NCCP/HCP Covered Species.

Recommended Action

See Mitigation Measure #1 and standard NCCP/HCP construction minimization measures (PDF-3).

6.3 COVERED SPECIES

The following is a list of species that are covered by the Central Subarea of the Central/Coastal Subregion NCCP/HCP:

Arboreal salamander (*Aneides lugubris*)
Black-bellied slender salamander (*Batrachoseps nigriventris*)
California gnatcatcher (*Polioptila californica californica*)
Catalina mariposa lily (*Calochortus catalinae*)
Coast [San Diego] horned lizard (*Phrynosoma coronatum*)
Coastal cactus wren (*Camplorhychus brunneicapillus*)
Coastal rosy boa (*Lichanura trivirgata rosafusca*)
Coastal western whiptail lizard (*Aspidoscelis* [*Cnemidophorus*] *tigris multicutatus*)
Coronado skink (*Eumeces skiltonianus interparietalis*)
Coulter matilija poppy (*Romneya coulteri*)
Coyote (*Canis latrans*)
Gray fox (*Urocyon cinereoargenteus*)
Heart-leaved pitcher sage (*Lepichinia cardiophylla*)
Northern harrier (*Circus cyaneus*)
Orange-throated whiptail lizard (Cnemidophorus *hyperythrus beldingi)*
Peregrine falcon *(Falco peregrinus)*
Red diamondback rattlesnake *(Crotalis ruber ruber)*
Red-shouldered hawk (*Buteo lineatus*)
Rough-legged hawk (*Buteo lagopus*)
San Bernardino ringneck snake (*Diadophis punctatus modestus*)
Bryant's [San Diego desert] woodrat (*Neotoma bryanti* [*lepida*] *intermedia*)
Santa Monica Mountains dudleya (*Dudle138uckneosa* spp. *ovatifolia*)
Sharp-shinned hawk (*Accipiter striatus*)
Small-flowered mountain mahogany (*Cercoccrpus minutifolio*)
Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)
Southwestern arroyo toad (*Bufo microseaphus californicus*)
Tecate cypress (*Cupressus forbesii*)

The Catalina mariposa lily, heart-leaved pitcher sage, Santa Monica mountains dudleya, small-flowered mountain mahogany, and Tecate cypress are not expected to occur in the BSA. The remaining species have either been observed or may occur in the BSA and could be impacted by the Project. However, the NCCP mitigates for all impacts on these species.

Recommended Action

See Mitigation Measure #1 and standard construction minimization measures (PDF-3). No additional mitigation measures would be required.

6.4 CONDITIONALLY COVERED SPECIES

The following is a list of species that are conditionally covered species with a brief explanation of the status of this species in the BSA:

Pacific Pocket Mouse (*Perognathus longimembris pacificus*)

The Pacific pocket mouse is not expected to occur in the BSA because it is outside of its current known range.

[Southwestern] Arroyo Toad (*Bufo microscaphus californicus*)

Potential habitat for the arroyo toad is present in the BSA. Focused surveys for this species were conducted downstream of Santiago Creek Dam in 2020 and upstream of Irvine Lake in 2022; no arroyo toad were observed. Therefore, this species is not expected to occur.

Least Bell's Vireo (*Vireo bellii pusillus*)

Potential habitat for the least Bell's vireo is present in the BSA. Focused surveys for this species were conducted downstream of Santiago Creek Dam in 2020; no vireo were observed. Focused surveys for this species were conducted upstream of Santiago Creek Dam in 2022; least Bell's vireo were observed throughout riparian scrub/woodland habitat at the upper end of Irvine Lake, along Santiago Creek, and in the southern portion of Irvine Lake. Least Bell's vireo was incidentally observed in the riparian habitat downstream of the dam during focused surveys conducted in summer 2024.

Recommended Action

See Mitigation Measure #6.

Southwestern Willow Flycatcher (*Empidonax trailii extimus*)

Potential habitat for the southwestern willow flycatcher is present in the BSA upstream of Santiago Creek Dam. Focused surveys for this species were conducted in 2022; no southwestern willow flycatchers were observed. Therefore, this species is not expected to occur in the BSA.

Quino Checkerspot Butterfly (*Euphidryucknetha quino*)

Potential habitat for the quino checkerspot butterfly is present in the BSA. Focused surveys were conducted for this species in 2022; no quino checkerspot were conducted. Therefore, this species is not expected occur in the BSA.

Riverside Fairy Shrimp (*Streptocephalus woottoni*)

This species is not expected to occur in the BSA due to lack of suitable habitat.

San Diego Fairy Shrimp (*Branchinecta sandeigonensis*)

This species is not expected to occur in the BSA due to lack of suitable habitat.

Golden Eagle (*Aquila chrysaetos*)

This species may forage and nest in the BSA due to the presence of suitable foraging habitat and nesting habitat adjacent to the BSA.

Recommended Action

With implementation of standard pre-construction surveys and nesting bird protection (PDF-5), no mitigation would be required.

Prairie Falcon (*Falco mexicanus*)

This species may forage and nest in the BSA due to the presence of suitable foraging habitat and nesting habitat adjacent to the BSA.

Recommended Action

With implementation of standard pre-construction surveys and nesting bird protection (PDF-5), no mitigation would be required.

Intermediate [Foothill] Mariposa Lily (*Calochortus weedii* var. *intermedius*)

Potential habitat for the Intermediate mariposa lily is present in the BSA. Focused surveys for this species were conducted downstream of Santiago Creek Dam in 2020, and one individual mariposa lily was observed. Focused surveys for this species were conducted upstream of Santiago Creek Dam in 2022, and five individual intermediate mariposa lilies were observed in three locations. The intermediate mariposa lily location downstream of the dam is within the temporary impact area and would be impacted if it cannot be avoided during construction. The remaining intermediate mariposa lily locations observed are outside the permanent and temporary impact areas for the Project. Two of the intermediate mariposa lily locations (consisting of four individuals) are located within the additional inundation area; however, they are already located at the edge of the existing inundation area and would not be expected to be significantly impacted. Additionally, the NCCP/HCP covers the loss of up to 20 intermediate mariposa lily individuals; therefore, the loss of one individual within the temporary impact area plus the potential loss of four individuals within the additional inundation area would be covered by the NCCP/HCP.

Recommended Action

See Mitigation Measure # 4. No mitigation would be required.

6.5 COVERED HABITATS

The following is a list of habitats that are covered by the Central Subarea of the Central/Coastal Subregion NCCP/HCP:

Oak woodlands
Tecate cypress forest
Cliff and Rock

Tecate cypress forest does not occur in the BSA.

Oak woodland occurs in the BSA as coast live oak woodland. The Project would impact 3.31 acres of coast live oak woodland habitat (0.48 acre permanent; 2.78 acres temporary; and 0.05 acre within the SCE realignment). Raising the spillway would also temporarily impact 0.50 acre of coast live oak woodland within the additional inundation area.

Cliff and rock occur in the BSA as cliff. A total of 0.52 acre (0.30 acre permanent, 0.21 acre temporary; 0.01 acre within the SCE realignment) of cliff would be impacted to construct the Project. Raising the spillway would also temporarily impact 0.01 acre of cliff within the additional inundation area.

The NCCP/HCP fully mitigates for all impacts on these habitat types.

Recommended Action

See Mitigation Measure #3 regarding replacement of coast live oak trees. No mitigation measures would be required for the loss of oak woodland habitat.

6.6 MIGRATORY BIRD TREATY ACT

The original Migratory Bird Treaty Act of 1918 implemented the 1916 Convention between the United States and Great Britain (for Canada) for the protection of migratory birds. Specific provisions of the statute include the establishment of a Federal prohibition, unless permitted, to "pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird, included in the terms of the Convention … for the protection of migratory birds … or any part, nest, or egg of any such bird."

Bird species protected under the provisions of the Migratory Bird Treaty Act are identified by the List of Migratory Birds (Title 50 of the Code of Federal Regulations, Section 10.13 as updated by 1983 AOU Check-list and published supplements through 1995, U.S. Fish and Wildlife Service).

Section 8.3.7 of the NCCP/HCP Implementation Agreement authorizes the participating landowners who possess a 10(a) permit under this program to take species covered by the permit in the amount and/or number and subject to the same terms and conditions as

specified in the permit. Any such take will not be in violation of the Migratory Bird Treaty Act of 1918 as amended (16 U.S.C. §§ 703-12).

Recommended Action

With implementation of standard pre-construction surveys and nesting bird protection (PDF-5), no mitigation would be required.

7.0 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Assuming impacts to mud nama can be reduced to less than 50 percent of the population mapped in 2022 through refinement of Project design, the impact will be reduced to less than significant with the incorporation of recommended mitigation. For all other impacts, implementation of the recommended mitigation measures will mitigate biological impacts to a level that is considered less than significant.

APPENDIX A

GEOTECHNICAL INVESTIGATION MEMORANDUMS

SANTIAGO DAM GEOTECHNICAL INVESTIGATIONS
BIOLOGICAL RESOURCES MEMORANDUM

December 14, 2023

To: Andy Uk
IRWD

From: Amber Heredia
Psomas

As part of a larger Santiago Creek Dam Outlet Tower and Spillway Improvements Project (Project), Irvine Ranch Water District (IRWD) and Serrano Water District (SWD) propose to conduct additional geotechnical investigations (hereinafter referred to as the "geotechnical investigations") to provide necessary geologic and geotechnical data to inform the Project's design engineering of a new spillway. The geotechnical investigations include geotechnical exploratory test pits and geophysical seismic refraction lines. The geotechnical investigation would be entirely within the Project's permanent or temporary impact footprint. The purpose of this Memorandum is to evaluate the proposed impact of the geotechnical investigation program on Biological and Jurisdictional Resources.

No cultural resources are known to occur within the limits of the proposed geotechnical investigation.

Project Background

IRWD and SWD jointly own and operate Irvine Lake and the Santiago Creek Dam that serves as a critical water supply for both districts. Santiago Creek Dam is a compacted earthfill embankment completed in 1933 and certified by the State of California, Department of Water Resources (DWR), Division of Safety of Dams (DSOD). Santiago Creek Dam impounds water for Irvine Lake on Santiago Creek, a tributary to the Santa Ana River. A seismic assessment requested by the DSOD found that the spillway is nearing the end of its useful life, and the design does not meet current standards. To meet current DSOD regulatory requirements and improve water supply reliability, IRWD and SWD propose to rehabilitate and replace the Santiago Creek Dam outlet tower and spillway structure by implementing the Project. The area of the proposed new spillway is critical to the overall design of the Project, however there is limited historical subsurface information of the area. There is the potential for significant cost implications without reliable soil characterizations in advance of finalizing the design.

In 2020, the DSOD downgraded the condition of the dam to the second to the lowest possible rating due to the two known deficiencies (issues with the spillway and outlet tower). DSOD further restricted the operating levels of the reservoir, which limits the ability to store local runoff water supplies for the benefit of the region. DSOD, IRWD, and SWD agreed to repair the known deficiencies by 2029. Because the existing dam must remain in place and operational throughout the course of construction of the spillway structure, the bulk of the construction must occur in the summer dry seasons. Milestones at the end of each dry season have been established so that the contractor will be able to winterize the Project and be ready for the next dry season. The Project is scheduled to begin construction in the first dry season of 2025 and to be completed by 2029. The proposed geotechnical investigations are needed to inform the final design so that the project construction can start in the dry season of 2025.

Project Location

The Project is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California. It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon

Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake. Residential development is located east of SR-241.

The Project is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle. Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west, ultimately reaching the Santa Ana River. Elevations on the Project site range from approximately 657 to 996 feet above mean sea level.

The Project is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Dam and its associated structures are located within designated "Non-Reserve Open Space". IRWD is a participating jurisdiction; Santiago Dam is a permitted existing use under the NCCP/HCP.

The geotechnical investigation sites are on the downstream side of the dam within the disturbance footprint of the proposed new spillway, which runs partly along Santiago Creek and partly in the adjacent uplands. The area is along the chute of the new spillway structure at the stilling basin (Exhibit 1).

Description of Geotechnical Investigation Work:

To inform the design of the spillway structure, the proposed geotechnical investigations are needed to provide necessary geologic and geotechnical information to fully characterize the existing soil and subsurface conditions at the site of the new spillway structure.

IRWD/SWD propose to conduct 10 geotechnical exploratory test pits and 4 geophysical survey transects downstream of the existing dam where the new spillway would be constructed. Each geotechnical test pit would be approximately 10 feet deep and would be 3 feet in diameter; the work area around each test pit is assumed to be 20 feet by 20 feet. At the test pit locations, contractors will utilize a small rubber-tracked mounted excavator with an excavation bucket for digging and tracking over brush. This work is expected to require six to seven days to complete. Test pit locations as shown on Exhibit 1 were selected based on the location of the proposed spillway and information needed. These locations may be modified by IRWD and SWD as needed in the field to avoid trees, sensitive vegetation, or jurisdictional areas, if needed. Samples of subsurface materials would be collected from the test pits for examination and laboratory testing. Following the completion of the test pit, each hole would be backfilled using the dirt spoils that came from the hole.

The four geophysical seismic refraction lines would be conducted at the site of the new spillway structure to evaluate bedrock and seismic conditions. The geophysical refraction lines would not require digging/trenching, but may require removal of minimal vegetation if it cannot be avoided to allow the laying of the cable. A minimum 10-inch width area is needed for the cable. The cable can be snaked around shrubs as needed. If any vegetation removal is needed, it would be performed using hand tools (e.g., loppers, pruners, shovels, and picks). Although only 10 inches would be needed in some locations, , this analysis assumes an average disturbance width of 3 feet because some areas may require removal of a limited amount of shrubs. Removal of trees would be avoided. No surface soil would be removed. This work is expected to require six to seven days to complete.

The geotechnical investigations will be accessed using existing dirt roads adjacent to existing downstream control structure and storage shed. One test pit will be accessed from the dam crest and spillway overlook. Temporary access routes from the existing dirt roads to each test pit would be needed. Where feasible,

temporary access would be established by the "drive and crush" method to limit vegetation disturbance. The drive and crush method involves substantially less disturbance than blading of the surface material; some vegetation would be crushed, but would not be cut or removed, allowing it to retain the root structure and resprout in place.

Each individual geotechnical investigation activity is anticipated to be completed within one working day and would not result in open pits beyond working hours. A limited number of workers (typically about five) would be required to perform the work. Workers would commute individually and would park in a designated existing staging area (e.g., along established dirt roads). There would be no nighttime work conducted as part of the geotechnical investigations.

Access roads in Santiago Creek and within native vegetation would be needed to access all the geotechnical testing sites. The access roads in jurisdictional waters and coastal sage scrub would be limited to a width of 8 feet 6 inches, which is the width of the proposed backhoe (i.e., CASE CX-1450 backhoe with rubber treads). Some minor grading may be needed along the temporary access roads, but wherever possible, the backhoe would be walked up to each test pit site to minimize disturbance to the streambed and sensitive vegetation. The backhoe would be walked in following a Biological Monitor who would help to find a path to minimize impacts to native vegetation to the extent possible.

Prior to the geotechnical work, the Biological Monitor will conduct a Worker Environmental Awareness Program (WEAP) training with the contractor to inform the workers of the environmental sensitivity of the area. The Biological Monitor will walk the proposed work areas and access routes with the Geotechnical Contractor. The Biological Monitor will make suggestions by slightly shifting or narrowing the access road and/or proposed work areas to site the geotechnical disturbance in previously disturbed areas and to avoid or minimize impacts to sensitive shrubs (i.e., coastal sage scrub or riparian) and jurisdictional resources. The Biological Monitor will flag the shrubs to be avoided along the access route prior to work activities and will monitor the work to ensure that impacts are minimized to the extent practicable. In addition, to reduce the potential for the spread of weed seeds, all heavy equipment will be cleaned (including wheels, tracks, undercarriages, and bumpers as applicable) before delivery to the site.

If needed, depending on project timing, a pre-construction nesting bird survey will be conducted by the Biological Monitor prior to any work activities. The Biological Monitor will establish a protective buffer around any active nests, and work may be redirected, as needed, to avoid these areas. The geotechnical work is currently proposed to occur during the non-breeding season (i.e., September 1 to February 14) of the federally Threatened coastal California gnatcatcher (*Polioptila californica californica*).

Because the geotechnical investigations would impact the same areas as the future Project, IRWD and SWD propose to use mitigation proposed for the Project to offset impacts associated with the geotechnical investigations.

Methods

In support of the Project and its Environmental Impact Report (EIR) (Psomas [in preparation]), Psomas conducted a literature review that included the following: (1) a database search of the California Natural Diversity Database (California Department of Fish and Wildlife [CDFW] 2023); (2) a database search of the Electronic Inventory of the California Native Plant Society (CNPS 2023); (3) the Information for Planning and Consultation Database (U.S. Fish and Wildlife Service [USFWS] 2023); and (4) Central-Coastal NCCP/HCP (County of Orange 1996) requirements applicable to the Project.

Psomas Senior Biologist Allison Rudalevige conducted vegetation mapping and general plant and wildlife surveys downstream of the dam on February 25, 2020. Ms. Rudalevige conducted a jurisdictional delineation downstream of the dam on March 24, 2020. Psomas Senior Biologist Jonathan Aguayo conducted focused surveys for arroyo toad downstream of the dam in spring/summer 2020. Psomas Senior Biologist Lindsay Messett conducted focused surveys for coastal California gnatcatcher and least Bell's vireo (*Vireo bellii pusillus*) downstream of the dam in spring/summer 2020. Ms. Rudalevige conducted focused surveys for special status plants in spring/summer 2020. Ms. Messett conducted focused surveys for Quino checkerspot (*Euphydryas editha quino*) in spring 2022. Detailed methods for these biological surveys are provided in the Biological Technical Report and Jurisdictional Delineation Report (Psomas 2023a, 2023b).

Existing Conditions

Vegetation Types

Existing conditions are described in detail in the Biological Technical Report for the Project (Psomas 2023a). The following vegetation types and other areas occur within or adjacent to the geotechnical investigations area downstream of the dam: sagebrush scrub (2.3.6)[1], disturbed sagebrush scrub (2.3.6), disturbed floodplain sage scrub (2.6), toyon–sumac chaparral (3.12), annual grassland (4.1), southern willow scrub (7.2), mulefat scrub (7.3), coast live oak woodland (8.1), western sycamore (8.x[2]), cliff (10.0), open water (12.1), developed (15.6), and disturbed (16.1).

Wildlife

No fish are expected to occur in the geotechnical investigations area because Santiago Creek is ephemeral downstream of the dam.

Amphibian species that may occur in the geotechnical investigations area include western toad (*Anaxyrus boreas*), California treefrog (*Pseudacris cadaverina*), Baja California treefrog (*Pseudacris hypochondriaca*), garden slender salamander (*Batrachoseps major major*), black-bellied salamander (*Batrachoseps nigriventris*), and arboreal salamander (*Aneides lugubris*).

Common reptile species that may occur in the geotechnical investigations area include common side-blotched lizard (*Uta stansburiana*), western fence lizard (*Sceloporus occidentalis*), southern alligator lizard (*Elgaria multicarinata*), western skink (*Plestiodon skiltonianus*), red racer (*Coluber flagellum piceus*), California striped racer (*Coluber lateralis lateralis*), California kingsnake (*Lampropeltis californiae*), gopher snake (*Pituophis catenifer*), and southern Pacific rattlesnake (*Crotalus oreganus helleri*).

The following resident bird species may occur in the geotechnical investigations area: California quail (*Callipepla californica*), mourning dove (*Zenaida macroura*), Anna's hummingbird (*Calypte anna*), acorn woodpecker (*Melanerpes formicivorus*), northern flicker (*Colaptes auratus*), black phoebe (*Sayornis nigricans*), Say's phoebe (*Sayornis saya*), California scrub jay (*Aphelocoma californica*), American crow (*Corvus brachyrhynchos*), common raven (*Corvus corax*), oak titmouse (*Baeolophus inornatus*), Bewick's wren (*Thryomanes bewickii*), blue-gray gnatcatcher (*Polioptila caerulea*), northern

1 Number codes for each vegetation type correspond to Gray and Bramlet (1992).
2 8.x indicates that this vegetation type is within the woodland category; however, there is no specific number code for western sycamore woodland.

mockingbird (*Mimus polyglottos*), house finch (*Haemorhous mexicanus*), lesser goldfinch (*Spinus psaltria*), California towhee (*Melozone crissalis*), song sparrow (*Melospiza melodia*), and common yellowthroat (*Geothlypis trichas*). Migratory bird species that may occur in the geotechnical investigations area include black-chinned hummingbird (*Archilochus alexandri*), Pacific-slope flycatcher (*Empidonax difficilis*), ash-throated flycatcher (*Myiarchus cinerascens*), phainopepla (*Phainopepla nitens*), hooded oriole (*Icterus cucullatus*), and Bullock's oriole (*Icterus bullockii*). Wintering bird species that may occur in the geotechnical investigations area include ruby-crowned kinglet (*Regulus calendula*), cedar waxwing (*Bombycilla cedrorum*), yellow-rumped warbler (*Setophaga coronata*), and white-crowned sparrow (*Zonotrichia leucophrys*).

Raptors (birds of prey) that may occur in the geotechnical investigations area include Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), great-horned owl (*Bubo virginianus*), barn owl (*Tyto alba*), western screech owl (*Megascops kennicottii*), and American kestrel (*Falco sparverius*). The turkey vulture (*Cathartes aura*), a scavenger, was observed.

Small mammals that may occur in the geotechnical investigations area include California ground squirrel (*Otospermophilus beecheyi*) and desert cottontail (*Sylvilagus audubonii*). Medium to large-sized mammals that may occur in the geotechnical investigations area include mountain lion (*Puma concolor*), coyote (*Canis latrans*), northern raccoon (*Procyon lotor*), and southern mule deer (*Odocoileus hemionus*). Bat species that may occur in the geotechnical investigations area for foraging and roosting include greater bonneted bat [western mastiff bat] (*Eumops perotis*), Brazilian free-tailed bat (*Tadarida brasiliensis*), big brown bat (*Eptesicus fuscus*), canyon bat (*Parastrellus hesperus*), pallid bat (*Antrozous pallidus*), California myotis (*Myotis californicus*), and Yuma bat (*Myotis yumanensis*).

Wildlife Movement

Wildlife movement in the geotechnical investigations area would primarily occur along Santiago Creek or along surrounding ridgelines; local wildlife movement could occur through all habitat types. The geotechnical investigations area is contiguous with large undeveloped open space areas in the NCCP Reserve, OC Regional Parks, and the Cleveland National Forest. Due to the undeveloped nature of the area, wildlife movement is generally unconstrained in and around the geotechnical investigations area. Santiago Creek likely functions as a regional movement corridor and connects with several canyons both upstream and downstream. The existing dam structure and associated reservoir (i.e., Irvine Lake) may be a barrier to movement for amphibians, reptiles, and small mammals moving upstream along the drainage; however, like larger mammals, these small animals can move around the lake and dam over time using the adjacent drainages and ridgelines as travel routes.

<u>Geotechnical Investigation Impacts</u>

Vegetation Types

The proposed geotechnical activities would temporarily impact native vegetation types. The geotechnical investigations are located almost entirely within the Project's permanent impact footprint for the new spillway; the remainder are located within the Project's temporary impact footprint for construction of the new spillway. No restoration is currently planned following the geotechnical investigations because the work activities are within the footprint of the Project. Project impacts would be fully mitigated as described in the Project EIR (Psomas [in preparation]). Applicable mitigation measures from the Project EIR are included below. Following completion of the geotechnical investigations, there would be no

paved roads or permanent structures. Though not expected, if the Project does not occur, the area could be restored to natural conditions.

The following vegetation types and other areas would be temporarily impacted by proposed geotechnical investigations: sagebrush scrub, disturbed floodplain sage scrub, toyon–sumac chaparral, annual grassland, mulefat scrub, and developed (Table 1, Exhibit 1).

TABLE 1
GEOTECHNICAL INVESTIGATION VEGETATION IMPACTS

Vegetation Types (Gray and Bramlet Code)	Temporary Impact (acre)
Sagebrush Scrub (2.3.6)	0.132
Disturbed Sagebrush Scrub (2.3.6)	0.001
Disturbed Floodplain Sage Scrub (2.6)	0.017
Toyon–Sumac Chaparral (3.12).	0.154
Annual Grassland (4.1)	0.053
Southern Willow Scrub (7.2)	0.004
Mulefat Scrub (7.3)	0.068
Coast Live Oak Woodland (8.1)	—
Sycamore Woodland (8.x)	—
Cliff (10.0)	—
Open Water (12.1)	—
Developed (15.6)	0.012
Disturbed (16.1)	—
Total	**0.441**

A total of 0.338 acre of coastal sage scrub (0.132 acre of sagebrush scrub, 0.001 acre of disturbed sagebrush scrub, and 0.017 acre of floodplain sage scrub) would be impacted by the proposed geotechnical investigations. Impacts on these vegetation types would be considered significant as these vegetation types provide habitat for the coastal California gnatcatcher, which is known to occur in the geotechnical investigations area. Additionally, disturbed floodplain sage scrub is considered a sensitive natural community by CDFW. Take of coastal sage scrub is fully covered by participation in the NCCP/HCP for IRWD. SWD is not a participating jurisdiction in the NCCP/HCP; however, the NCCP/HCP coverage could still be used with payment of the per-acre mitigation fee or alternative mitigation for the loss of coastal sage scrub. IRWD's take for its share of the impacts will be accounted for according to the NCCP/HCP and that SWD will provide compensatory mitigation for its loss of coastal sage scrub as part of the Project's mitigation.

A total of 0.154 acre of toyon–sumac chaparral would be impacted by the proposed geotechnical investigations. While the loss of chaparral would be considered adverse, the loss would be limited in relation to the total amount of chaparral vegetation available in the Project region. Toyon–sumac chaparral is not considered a sensitive natural community by CDFW. Impacts on toyon–sumac chaparral would be considered less than significant; therefore, no mitigation would be required.

A total of 0.053 acre of annual grassland would be impacted by the proposed geotechnical investigations. This vegetation type is generally considered of low biological value, is relatively common in the Project

region, and is not considered a sensitive natural community by CDFW. Impacts on grassland would be considered less than significant; therefore, no mitigation would be required.

A total of 0.0.072 acre of riparian vegetation (0.004 southern willow scrub and 0.068 acre mulefat scrub) would be impacted by the proposed geotechnical investigations. Impacts on riparian vegetation types are considered significant because federal and State resource agencies (i.e., U.S. Army Corps of Engineers [USACE], CDFW, and Regional Water Quality Control Board [RWQCB]) have given these vegetation types special status due to their high biological value; jurisdictional areas are discussed below under Jurisdictional Resources. IRWD and SWD will provide compensatory mitigation for the loss of mule fat scrub as part of the Project's mitigation.

A total of 0.012 acre of developed areas (i.e., existing road) would be impacted by the proposed geotechnical investigations. Developed areas are considered of low biological value. Impacts on developed areas would be considered less than significant; therefore, no mitigation would be required.

Jurisdictional Resources

A detailed description of each drainage is provided in the Project's Jurisdictional Delineation Report (Psomas 2023b).

USACE

A total of 0.077 acre of waters of the U.S. (WOTUS) under the regulatory authority of the USACE would be impacted by the proposed geotechnical investigations (Table 2; Exhibit 2). This represents impacts to WOTUS along Santiago Creek downstream of the dam. Nationwide Permit (NWP) 6 allows for the loss of less than 0.10 acre of WOTUS for the purpose of geotechnical investigations. IRWD/SWD will obtain a NWP 6 prior to initiating geotechnical investigations.

RWQCB

A total of 0.078 acre of waters of the State under the regulatory authority of the RWQCB would be impacted by the proposed geotechnical investigations (Table 2, Exhibit 3). This represents impacts to waters of the State along Santiago Creek and Drainage 2. IRWD/SWD will obtain a Section 401 Water Quality Certification, consistent with NWP 6, prior to initiating geotechnical investigations.

CDFW

A total of 0.107 acre of waters under the regulatory authority of CDFW would be impacted by the proposed geotechnical investigations (Table 2, Exhibit 4). This represents impacts to waters under the authority of CDFW along Santiago Creek and Drainage 2. A Streambed Alteration Agreement will be obtained to allow for the loss of CDFW jurisdiction prior to initiating geotechnical investigations.

TABLE 2
GEOTECHNICAL IMPACTS ON
JURISDICTIONAL RESOURCES

Jurisdiction	Amount of Jurisdictional Water Resource (acres)
	Temporary
USACE WOTUS	Wetland: 0.000
	Non-wetland: 0.077
	Total: 0.077
RWCQB Waters of the State	Wetland: 0.000
	Non-wetland: 0.078
	Total: 0.078
CDFW Jurisdictional Resources	0.107

USACE: U.S. Army Corps of Engineers; WOTUS: waters of the United States; RWQCB: Regional Water Quality Control Board; CDFW: California Department of Fish and Wildlife.

Wildlife Habitat

Geotechnical investigations would result in a limited loss of native vegetation types. While these vegetation types provide potential nesting, roosting, foraging, and denning opportunities for wildlife species, there would be a limited amount of habitat loss (0.429 acre) and many acres of similar habitats would remain immediately adjacent to the areas that would be disturbed (over 1,015 acres of habitat remaining in the Project's Biological Study Area [BSA]). Any wildlife disturbed by the proposed activities could move to areas of habitat immediately adjacent to the areas disturbed. The work would be temporary in nature (approximately two weeks total, with work at each location occurring for one or two days). Wildlife may move away from the disturbance and human activity temporarily but would be expected to return following completion of the geotechnical investigations. Therefore, the impact of the proposed geotechnical investigations would be considered adverse but less than significant on wildlife because they would not reduce wildlife populations in the region.

Work would occur only during daylight hours; wildlife would be expected to continue to use all areas of the Project site for wildlife movement at night, including areas within the proposed geotechnical investigation area.

It is expected that work at each test pit would be completed within one day. If the work extended over multiple days, the test pits would be covered at the completion of work each day. This would ensure that no wildlife fall into the trench and become entrapped when work is not occurring. While the loss of a few individuals of common wildlife species (e.g., western fence lizard) would not be considered significant, the loss of individuals would be avoided and minimized during the geotechnical investigation activities.

<u>Nesting Birds</u>

The Migratory Bird Treaty Act (MBTA) protects the taking of migratory birds and their nests and eggs. Bird species protected under the provisions of the MBTA are identified by the List of Migratory Birds

(*Code of Federal Regulations*, Title 50, §10.13). Section 3503 of the *California Fish and Game Code* makes it unlawful to take, possess, or destroy any bird's nest or any bird's eggs. Section 3513 of the *California Fish and Game Code* prohibits the take and possession of any migratory nongame bird, as designated in the MBTA. Birds have potential to nest throughout geotechnical investigations area in vegetation and on bare ground. Geotechnical activities are planned to occur prior to the nesting season (i.e., February 15 to August 31); therefore, no impact on nesting birds is expected. As discussed previously, the Biological Monitor will conduct a pre-construction nesting bird/raptor survey prior to the initiation of geotechnical activities to ensure that no nests are present within the proposed impact area. If an active nest is present, activities would be restricted as needed in the immediate vicinity of the nest until nesting is complete.

Trees in the BSA have potential to be used for nesting by raptors such as the American kestrel, red-tailed hawk, and Cooper's hawk. The raptor nesting season is generally from February 1 to June 30. Regulations prohibit activities that "take, possess, or destroy" any raptor nest or egg (*California Fish and Game Code* §3503, 3503.5, and 3513). Additionally, the noise and disturbance associated with construction may disturb a nesting raptor adjacent to the proposed geotechnical activities. Geotechnical activities may be conducted during the raptor nesting season (i.e., February 1 to June 30). As discussed previously, the Biological Monitor will conduct a pre-construction nesting bird/raptor survey prior to the initiation of geotechnical activities to ensure that no nests are present within the proposed impact area. If an active nest is present, activities would be restricted as needed in the immediate vicinity of the nest until nesting is complete.

Special Status Plant Species

Focused surveys were conducted for special status plant species; details of the results are included in the Biological Technical Report (Psomas 2023a). No special status plant species are located in the geotechnical investigations area. Therefore, there would be no impact on these species, and no mitigation would be required.

Special Status Wildlife Species

Focused surveys for the following special status wildlife were conducted downstream of the dam: Quino checkerspot, arroyo toad, coastal California gnatcatcher, and least Bell's vireo. Details on the methods and results of the focused surveys are included in the Biological Technical Report for the Project (Psomas 2023a). This section focuses on high status species (i.e., Threatened, Endangered, or Candidate species) because those species would be the ones that could trigger a significant impact.

Quino checkerspot and arroyo toad would not be expected to occur in the geotechnical investigations area because they were not observed during focused surveys.

Crotch bumble bee (*Bombus crotchii*) has potential to occur in the geotechnical investigations area. While there would be a limited amount of foraging habitat loss (0.429 acre), many acres of similar habitats would remain immediately adjacent to the areas that would be disturbed (over 1,015 acres of habitat remaining in the BSA). The proposed geotechnical activities would occur outside the breeding season of the Crotch bumble bee (i.e., March to July); therefore, if there are bees present, the geotechnical activities would not affect nesting.

Coastal California gnatcatcher is known to occur in coastal sage scrub habitats in the geotechnical investigations area. As discussed above, geotechnical activities would impact 0.338 acre of sagebrush

scrub and floodplain sage scrub occupied by the coastal California gnatcatcher. Take of coastal sage scrub is fully covered by participation in the NCCP/HCP for IRWD. SWD is not a participating jurisdiction in the NCCP/HCP; however, the NCCP/HCP coverage could still be used with payment of the per-acre mitigation fee or alternative mitigation for the loss of coastal sage scrub. NCCP/HCP avoidance and minimization measures require that a biological monitor be present during clearing of coastal sage scrub.

Least Bell's vireo would not be expected within the area of proposed geotechnical investigations because it was not observed during focused surveys in spring/summer 2020. Additionally, geotechnical investigations would occur outside the breeding season for this species (i.e., March 15 to September 15) when it would be on its wintering grounds. Therefore, the noise from geotechnical investigations would not affect least Bell's vireo since it would not be present when the geotechnical investigations are planned to occur and because riparian habitat downstream of the dam was not occupied during previous surveys.

The bald eagle may occur as a flyover occurrence; it is expected to forage over Irvine Lake. The bald eagle is not expected to nest within the area of proposed geotechnical investigations due to lack of suitable nesting habitat (large trees). Geotechnical activities may be conducted during the raptor nesting season (i.e., February 1 to June 30). As discussed previously, the Biological Monitor will conduct a pre-construction nesting bird/raptor survey prior to the initiation of geotechnical activities to ensure that no nests are present within the proposed impact area. If an active nest is present, activities would be restricted as needed in the immediate vicinity of the nest until nesting is complete.

Mountain lion may occur in the BSA and may forage in the area where geotechnical activities would occur. As mentioned above under wildlife movement, the proposed geotechnical activities would occur during daylight hours and would not interfere with foraging by this nocturnal species. The mountain lion would be expected to continue to use the proposed work area for foraging and wildlife movement at night throughout the duration of the proposed geotechnical activities.

Several other special status amphibians, reptiles, birds, and mammals have potential to occur within the impact area for the geotechnical investigations. No roosting habitat for bat species is present in the geotechnical investigations area (e.g., structures, large trees); roosting habitat is present in the vicinity and special status bats may forage in the geotechnical investigations area. The geotechnical investigations would be located entirely within the Project's impact footprint for the new spillway. While there would be a limited temporary loss of habitat (0.429 acre) following the geotechnical investigations, many acres of similar habitats would remain immediately adjacent to the areas that would be disturbed (over 1,015 acres of habitat remaining in the BSA). Therefore, the impact on other special status amphibians, reptiles, birds, and mammals would be less than significant and no mitigation would be required.

Indirect Impacts

Noise Impacts

The BSA includes some periodic noise events, including consistent low helicopter flights and landings and periodic special events in the adjacent park (e.g., concerts). Noise levels in the BSA would increase over present levels during geotechnical investigations due to construction vehicles. Temporary noise impacts have the potential to disrupt foraging, nesting, roosting, and denning activities for a variety of wildlife species. Temporary noise from geotechnical activities may cause birds adjacent to the work area to temporarily leave the area or may discourage individuals from selecting habitat adjacent to the work area due to construction vehicle noise and human activity. These impacts are considered adverse, but not

significant for most wildlife species, because the Project would not impact a substantial population of these species and because work is planned to occur outside the breeding season for most species.

Geotechnical activities would create noise and human activity adjacent to areas of coastal sage scrub occupied by the coastal California gnatcatcher; however, work is planned to occur outside the breeding season for this species (i.e., September 1 to February 14). Coastal California gnatcatchers may move away from the disturbance and human activity temporarily but would be expected to return following completion of the geotechnical investigations. Therefore, indirect impacts would be considered adverse, but less than significant, for work conducted outside the breeding season. If work were to be conducted during the breeding season (i.e., February 15 to August 31), it could affect nesting activities (e.g., vocalizations between the pair, or flushing birds from their nests, leaving the eggs exposed to predation). This indirect impact would be considered potentially significant. If geotechnical activities were to occur during the breeding season, the pre-construction nesting bird survey will ensure that no work would occur in the immediate vicinity of the nest.

Increased Dust

Geotechnical activities would disturb soils and result in the accumulation of dust on the surface of the leaves of trees, shrubs, and herbs. The respiratory function of the plants in the area would be impaired when dust accumulation is excessive. This indirect effect of dust as a result of geotechnical activities is considered less than significant because it would only affect a limited area and would not substantially reduce plant populations in the region. Therefore, no mitigation would be required.

Water Quality

During geotechnical activities, excess silt, petroleum, or chemicals on the soil surface within the geotechnical investigations area could be washed into drainages (including Santiago Creek) and may affect areas downstream of the geotechnical activities. Adverse effects on water quality could indirectly impact species that use riparian areas within the watershed by affecting the food web interactions (e.g., abundance of insects or other prey) or through biomagnification (i.e., the buildup of chemicals in body tissues to toxic levels in higher trophic levels). To be compliant with regulatory requirements, the geotechnical investigations would implement Best Management Practices and erosion control measures to prevent the runoff of toxins, chemicals, petroleum products, or other elements that might degrade water quality. Assuming compliance with standard regulatory requirements, impacts on water quality would be less than significant, and no mitigation would be required.

Invasive Exotic Plant Species

Geotechnical activities create disturbance, which in turn provides a place for non-native weedy species to spread. As discussed previously, construction equipment would be washed prior to arrival on the site to ensure equipment would not introduce non-native weed seeds to the area. The use of Best Management Practices associated with prevention of the spread of weed seeds would result in an impact that is less than significant. Additionally, a native seed mix will be used for hydroseeding areas temporarily disturbed by construction activities (following the Project's construction).

Night Lighting

Geotechnical activities would occur during the day. Therefore, there would be no impact due to night lighting, and no mitigation would be required.

Human Activity

During geotechnical investigations, there would be a small increase in human activity (i.e., vehicle and foot traffic), which would increase the disturbance of natural open space adjacent to the geotechnical investigations area. Human disturbance could disrupt normal foraging and breeding behavior of wildlife adjacent to the geotechnical investigation area. As described above for noise, this disturbance would be considered potentially significant. As discussed previously, a WEAP training would be conducted by the Biological Monitor to ensure that geotechnical personnel are trained on the environmental sensitivity of the area.

Increased Wildfire Risk

During geotechnical investigations, construction equipment or personal vehicles have potential to accidentally ignite vegetation, starting a wildfire. Additionally, construction personnel may dispose of cigarettes inappropriately in the geotechnical investigations area and could ignite dry vegetation. If not contained quickly, the fire could spread through adjacent habitat areas. As discussed previously, a WEAP training will be conducted by the Biological Monitor to ensure that geotechnical personnel are trained on the environmental sensitivity of the area.

Mitigation

The Project Draft EIR (Psomas [in preparation]) includes compensatory mitigation for the loss of coastal sage scrub and riparian vegetation, and jurisdictional resources. These habitats would be mitigated at a minimum 1:1 ratio through use of one of the following options: (1) NCCP take credits (for coastal sage scrub); (2) preservation, restoration, and/or enhancement of on-site habitats; or (3) preservation, restoration, or enhancement of off-site habitats. IRWD/SWD have initiated consultation with the resource agencies to negotiate appropriate mitigation for the loss of these resources as a result of the Project, as consistent with the Clean Water Act, California Fish and Game Code, and the federal and State Endangered Species Acts.

SANTIAGO DAM GEOTECHNICAL INVESTIGATIONS
BIOLOGICAL RESOURCES MEMORANDUM

September 5, 2024

To: Andy Uk
IRWD

From: Amber Heredia
Psomas

As part of a larger Santiago Creek Dam Outlet Tower and Spillway Improvements Project (Project), Irvine Ranch Water District (IRWD) proposes to conduct an additional round of geotechnical investigations (hereinafter referred to as the "geotechnical investigations") to provide necessary geologic and geotechnical data to inform the Project's design engineering. The current geotechnical investigations include subsurface investigations of Irvine Lake to characterize soil material for use as borrow material to construct an earthen diversion berm adjacent to Santiago Creek Dam and a potential dam embankment improvement. The proposed geotechnical investigations include vibracores, geotechnical exploratory test pits, and hollow stem auger borings. The purpose of this Memorandum is to evaluate the proposed impact of the geotechnical investigation program on Biological and Jurisdictional Resources.

No cultural resources are known to occur within the limits of the proposed geotechnical investigation.

Project Background

IRWD owns and operates Irvine Lake and the Santiago Creek Dam that serves as a critical water supply for both IRWD and Serrano Water District. Santiago Creek Dam is a compacted earthfill embankment completed in 1933 and certified by the State of California, Department of Water Resources, Division of Safety of Dams (DSOD). Santiago Creek Dam impounds water for Irvine Lake on Santiago Creek, a tributary to the Santa Ana River. A seismic assessment requested by the DSOD found that the spillway is nearing the end of its useful life, and the design does not meet current standards. To meet current DSOD regulatory requirements and improve water supply reliability, IRWD proposes to rehabilitate and replace the Santiago Creek Dam outlet tower and spillway structure by implementing the Project. The area of the proposed boring location is important to the overall design of the Project; however, there is limited historical subsurface information of the area. There is potential for significant cost implications without reliable soil characterizations in advance of finalizing the design.

In 2020, the DSOD downgraded the condition of the dam to the second to the lowest possible rating due to the two known deficiencies (issues with the spillway and outlet tower). DSOD further restricted the operating levels of the reservoir, which limits the ability to store local runoff water supplies for the benefit of the region. DSOD and IRWD agreed to repair the known deficiencies by 2029. Because the existing dam must remain in place and operational throughout the course of construction of the spillway structure, the bulk of the construction must occur in the summer dry seasons. Milestones at the end of each dry season have been established so that the contractor will be able to winterize the Project and be ready for the next dry season. The Project is scheduled to begin construction in the first dry season of 2025 and to be completed by 2029. The proposed geotechnical investigations are needed to inform the final design so that the Project construction can start in the dry season of 2025.

Project Location

The Project is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California. It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake. Residential development is located east of SR-241.

The Project is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle. Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west, ultimately reaching the Santa Ana River. Elevations on the Project site range from approximately 657 to 996 feet above mean sea level.

The Project is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Dam and its associated structures are located within designated "Non-Reserve Open Space". IRWD is a participating jurisdiction; Santiago Dam is a permitted existing use under the NCCP/HCP.

The geotechnical investigation sites are located on the upstream side of the dam on the southeastern side of the lake where Santiago Creek enters the lake. Many of the geotechnical investigation sites are located in the lakebed or on the fluctuating shoreline (Exhibit 1).

Description of Geotechnical Investigation Work

To inform the location of the borrow site, the proposed geotechnical investigations are needed to provide necessary geologic and geotechnical information to fully characterize the existing soil and subsurface conditions of the potential borrow site material that would be used to construct an earthen berm and to reinforce the dam structure.

IRWD proposes to conduct 14 geotechnical vibracores, 7–9 exploratory test pits, and 2 hollow stem auger borings on the southeast side of the lake (Exhibit 1). Geotechnical locations were selected based on the location of the proposed borrow sites. These locations may be modified by IRWD as needed in the field to avoid trees, sensitive vegetation, or jurisdictional areas, to the extent possible. This work is expected to require 7 to 10 workdays to complete.

Vibracore samples would be taken from a barge; each vibracore sample would be approximately 4 inches in diameter and 15 feet deep. The vibracore samples are expected to take two to three workdays, with one additional day to mobilize and demobilize the barge from the boat ramp.

At the test pit locations, contractors will use a small rubber-tracked mounted excavator with an excavation bucket for digging and tracking over brush. Each geotechnical test pit would be approximately 3 feet wide, 10 feet long, and 10 feet deep; the work area around each test pit is assumed to be approximately 20 feet by 20 feet. Approximately 300 to 500 cubic yards of soil will be excavated from, and temporarily stockpiled adjacent to, the test pit. Samples of

subsurface materials would be collected from the test pits for examination and laboratory testing. Following the completion of the test pit, each hole would be backfilled using the dirt spoils that came from the hole. Two alternative test pits are included (i.e., TP-2a, TP-3a) and will be used if lake levels are low enough to allow them; the impact analysis assumes a worst-case scenario that both sites will be sampled, but in implementation, the field crew will select one set of sites to conduct sampling of soils. The test pits are expected to take three to four workdays.

At the hollow stem auger locations, a truck mounted drill rig will be used. Each geotechnical hollow stem auger would be approximately 8 inches wide and 30 feet deep; the work area around the hollow stem auger is assumed to be approximately 20 feet by 20 feet. Each hollow stem auger will generate one to three 55-gallon drums of soil cuttings; these drums filled with soil cuttings will be disposed of at an appropriate landfill. A two-inch polyvinyl chloride (PVC) standpipe piezometer will be installed in each boring to allow for the monitoring of ground water elevations in proposed borrow areas BA-3 and BA-4. The drilling of the hollow stem augers and installation of the piezometers is expected to take two to three workdays.

The geotechnical investigations will be accessed using existing dirt roads around the southeast portion of the lake. Temporary access routes from the existing dirt roads to each test pit and hollow stem auger would be needed. Where feasible, temporary access would be established by the “drive and crush” method to limit vegetation disturbance. The drive and crush method involves substantially less disturbance than blading of the surface material; some vegetation would be crushed, but would not be cut or removed, allowing it to retain the root structure and resprout in place.

Each individual geotechnical investigation activity is anticipated to be completed within one working day and would not result in open pits beyond working hours. A limited number of workers (typically about five) would be required to perform the work. Workers would commute individually and would park along established dirt roads. There would be no nighttime work conducted as part of the geotechnical investigations.

Access roads in jurisdictional waters and native vegetation would be limited to a width of approximately 8 feet 6 inches, which is the width of the proposed backhoe (i.e., CASE CX-1450 backhoe with rubber treads). Some minor grading may be needed along the temporary access roads, but wherever possible, the backhoe would be walked up to each test pit site to minimize disturbance to the streambed and sensitive vegetation. The backhoe would be walked in following a Biological Monitor who would help to find a path to minimize impacts to native vegetation to the extent possible.

Prior to the geotechnical work, the Biological Monitor will conduct a Worker Environmental Awareness Program (WEAP) training with the contractor to inform the workers of the environmental sensitivity of the area. The Biological Monitor will walk the proposed work areas and access routes with the Geotechnical Contractor. The Biological Monitor will make suggestions by slightly shifting or narrowing the access road and/or proposed work areas to site the geotechnical disturbance in previously disturbed areas and to avoid or minimize impacts to sensitive shrubs/trees (i.e., riparian) and jurisdictional resources. The Biological Monitor will flag the shrubs/trees to be avoided along the access route prior to work activities and will monitor the work to ensure that impacts are minimized to the extent practicable. In addition, to reduce

the potential for the spread of weed seeds, all heavy equipment will be cleaned (including wheels, tracks, undercarriages, and bumpers as applicable) before delivery to the site.

Work would be conducted outside the nesting bird season (i.e., September 16 to February 14). Therefore, no pre-construction nesting bird survey will be needed.

Geotechnical investigations within the selected borrow site would impact the same areas as the future Project. Geotechnical investigations within the borrow sites that are not selected would be minimal. IRWD proposes to use mitigation proposed for the Project to offset impacts associated with the geotechnical investigations.

Methods

In support of the Project and its Environmental Impact Report (EIR) (Psomas [in preparation]), Psomas conducted a literature review that included the following: (1) a database search of the California Natural Diversity Database (California Department of Fish and Wildlife [CDFW] 2024); (2) a database search of the Electronic Inventory of the California Native Plant Society (CNPS 2024); (3) the Information for Planning and Consultation Database (U.S. Fish and Wildlife Service [USFWS] 2024); and (4) Central-Coastal NCCP/HCP (County of Orange 1996) requirements applicable to the Project.

Psomas Senior Biologists Allison Rudalevige and Lindsay Messett conducted vegetation mapping and general plant and wildlife surveys upstream of the dam on September 16 and 17, 2020. Ms. Rudalevige conducted a jurisdictional delineation upstream of the dam on October 14, 20, and 21, 2020; she was accompanied by Psomas Senior Biologist Jonathan Aguayo or Ms. Messett. Protocol focused surveys were conducted upstream of the dam in spring/summer 2022. Ms. Rudalevige conducted focused surveys for special status plants. Mr. Aguayo conducted focused surveys for arroyo toad (*Anaxyrus californicus*), least Bell's vireo (*Vireo bellii pusillus*), and southwestern willow flycatcher (*Empidonax traillii extimus*). Ms. Messett conducted focused surveys for Quino checkerspot (*Euphydryas editha quino*), coastal California gnatcatcher (*Polioptila californica californica*), and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*). In summer 2024, Ms. Messett conducted protocol focused surveys for Crotch's bumble bee (*Bombus crotchii*) and Mr. Aguayo and Ms. Messett conducted protocol focused trapping and visual surveys for southwestern [western] pond turtle (*Actinemys pallida* [*Emys marmorata*]) [in progress]. Detailed methods for these biological surveys are included in the respective focused survey reports, which are summarized in the Biological Technical Report and Jurisdictional Delineation Report (Psomas 2024a, 2024b).

Existing Conditions

Vegetation Types

Existing conditions are described in detail in the Biological Technical Report for the Project (Psomas 2024a). The following vegetation types and other areas occur within or adjacent to the geotechnical investigations area downstream of the dam: sagebrush scrub (2.3.6)[1], disturbed sagebrush scrub (2.3.6), sagebrush-coyote bush scrub (2.3.12), southern cactus scrub (2.4), disturbed southern cactus scrub (2.4), toyon-sumac chaparral (3.12), annual grassland (4.1),

[1] Number codes for each vegetation type correspond to Gray and Bramlet (1992).

ruderal (4.6), riparian herb (7.1), disturbed mulefat scrub (7.3), southern black willow forest (7.7), disturbed southern black willow forest (7.7), southern black willow forest/riparian herb (7.7/7.1), coast live oak woodland (8.1), and vegetated fluctuating shoreline (12.2). Other landcover includes cliff (10.0), open water (12.1), fluctuating shoreline (12.2), perennial stream (13.1), ornamental (15.5), developed (15.6), and disturbed areas (16.1) (Exhibit 1).

Wildlife

Irvine Lake is stocked with fish, including rainbow trout (*Oncorhynchus mykiss*), bass (*Morone* sp.), catfish (*Ictalurus* sp.), common carp (*Cyprinus carpio*), bluegill (*Lepomis macrochirus*), and crappie (*Pomoxis* sp.). Non-native fish are predators on native species; no native fish (with the exception of the stocked rainbow trout) are expected to occur in Irvine Lake.

Amphibian species that may occur in the geotechnical investigations area include western toad (*Anaxyrus boreas*), California treefrog (*Pseudacris cadaverina*), Baja California treefrog (*Pseudacris hypochondriaca*), garden slender salamander (*Batrachoseps major major*), black-bellied salamander (*Batrachoseps nigriventris*), and arboreal salamander (*Aneides lugubris*).

Common reptile species that may occur in the geotechnical investigations area include common side-blotched lizard (*Uta stansburiana*), western fence lizard (*Sceloporus occidentalis*), southern alligator lizard (*Elgaria multicarinata*), western skink (*Plestiodon skiltonianus*), red racer (*Coluber flagellum piceus*), California striped racer (*Coluber lateralis lateralis*), California kingsnake (*Lampropeltis californiae*), gopher snake (*Pituophis catenifer*), and southern Pacific rattlesnake (*Crotalus oreganus helleri*).

The following resident bird species may occur in the geotechnical investigations area: California quail (*Callipepla californica*), mourning dove (*Zenaida macroura*), Anna's hummingbird (*Calypte anna*), acorn woodpecker (*Melanerpes formicivorus*), northern flicker (*Colaptes auratus*), black phoebe (*Sayornis nigricans*), American crow (*Corvus brachyrhynchos*), common raven (*Corvus corax*), Bewick's wren (*Thryomanes bewickii*), northern mockingbird (*Mimus polyglottos*), house finch (*Haemorhous mexicanus*), lesser goldfinch (*Spinus psaltria*), California towhee (*Melozone crissalis*), song sparrow (*Melospiza melodia*), and common yellowthroat (*Geothlypis trichas*). Wintering bird species that may occur in the geotechnical investigations area include ruby-crowned kinglet (*Regulus calendula*), cedar waxwing (*Bombycilla cedrorum*), yellow-rumped warbler (*Setophaga coronata*), and white-crowned sparrow (*Zonotrichia leucophrys*). Migratory species that occur during the breeding season would not be expected during the geotechnical investigations since they would occur during the non-breeding season.

Raptors (birds of prey) that may occur in the geotechnical investigations area include Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), great-horned owl (*Bubo virginianus*), barn owl (*Tyto alba*), western screech owl (*Megascops kennicottii*), American kestrel (*Falco sparverius*), and turkey vulture (*Cathartes aura*).

Small mammals that may occur in the geotechnical investigations area include California ground squirrel (*Otospermophilus beecheyi*), desert cottontail (*Sylvilagus audubonii*), North American deermouse (*Peromyscus maniculatus*), and Bryant's woodrat (*Neotoma bryanti*). Medium to large-sized mammals that may occur in the geotechnical investigations area include mountain lion (*Puma concolor*), coyote (*Canis latrans*), northern raccoon (*Procyon lotor*), and southern

mule deer (*Odocoileus hemionus*). Bat species that may occur in the geotechnical investigations area for foraging and roosting include greater bonneted bat [western mastiff bat] (*Eumops perotis*), Brazilian free-tailed bat (*Tadarida brasiliensis*), big brown bat (*Eptesicus fuscus*), canyon bat (*Parastrellus hesperus*), pallid bat (*Antrozous pallidus*), California myotis (*Myotis californicus*), and Yuma bat (*Myotis yumanensis*).

Wildlife Movement

Wildlife movement in the geotechnical investigations area would primarily occur along Santiago Creek or along surrounding ridgelines; local wildlife movement could occur through all habitat types. The geotechnical investigations area is contiguous with large undeveloped open space areas in the NCCP Reserve, OC Regional Parks, and the Cleveland National Forest. Due to the undeveloped nature of the area, wildlife movement is generally unconstrained in and around the lake and geotechnical investigations area. Santiago Creek likely functions as a regional movement corridor and connects with several canyons both upstream and downstream. The existing dam structure and associated reservoir (i.e., Irvine Lake) may be a barrier to movement for amphibians, reptiles, and small mammals; however, like larger mammals, these small animals can move around the lake and dam over time using the adjacent drainages and ridgelines as travel routes.

Geotechnical Investigation Impacts

Vegetation Types

The proposed geotechnical activities would temporarily impact native vegetation types. No restoration is currently planned following the geotechnical investigations because the work activities are primarily in ruderal areas and/or within the impact footprint of the Project's permanent or temporary impacts. Project impacts would be fully mitigated as described in the Project EIR (Psomas [in preparation]). Following completion of the geotechnical investigations, there would be no paved roads or permanent structures; although there would be two new piezometers. Though not expected, if the Project does not occur, the area could be restored to natural conditions.

The following vegetation types and other areas would be temporarily impacted by proposed geotechnical investigations: (Table 1, Exhibit 1).

TABLE 1
GEOTECHNICAL INVESTIGATION VEGETATION IMPACTS

Vegetation Types (Gray and Bramlet Code)	Temporary Impact (acre)
Sagebrush Scrub (2.3.6)	—
Disturbed Sagebrush Scrub (2.3.6)	—

Annual Grassland (4.1)	—
Ruderal (4.6)	0.50
Riparian Herb (7.1)	—
Disturbed Mulefat Scrub (7.3)	—
Southern Black Willow Forest (7.7)	—
Disturbed Southern Black Willow Forest (7.7)	—
Southern Black Willow Forest/Riparian Herb (7.7/7.1)	—
Coast Live Oak Woodland (8.1)	—
Cliff (10.0)	—
Open Water (12.1)	—
Vegetated Fluctuating Shoreline (12.2)	0.50
Perennial Stream (12.3)	—
Ornamental (15.5)	—
Developed (15.6)	0.20
Disturbed (16.1)	1.29
Total	**2.49**

No native vegetation types would be impacted by the proposed geotechnical investigations. However, the geotechnical investigations would be adjacent to several native vegetation types.

A total of 0.50 acre of ruderal would be impacted by the proposed geotechnical investigations. This vegetation type is generally considered of low biological value, is relatively common in the Project region, and is not considered a sensitive natural community by CDFW. Impacts on ruderal would be considered less than significant; therefore, no mitigation would be required.

A total of 0.50 acre of vegetated fluctuating shoreline would be impacted by the proposed geotechnical investigations. This vegetation type is not considered a sensitive natural community by CDFW. However, it is within the jurisdiction of the regulatory agencies discussed below under Jurisdictional Resources. Impacts to jurisdictional resources would be mitigated as part of the Project.

A total of 0.20 acre of developed areas and 1.29 acre of disturbed areas (i.e., existing roads) would be impacted by the proposed geotechnical investigations. Developed and disturbed areas are considered of low biological value. Impacts on developed areas would be considered less than significant; therefore, no mitigation would be required.

Jurisdictional Resources

A detailed description of each drainage is provided in the Project's Jurisdictional Delineation Report (Psomas 2024b).

U.S. Army Corps of Engineers (USACE)

A total of 0.149 acre of wetland waters of the U.S. (WOTUS), including 742 linear feet (717 feet along access roads and 25 feet total for all geotechnical locations), under the regulatory authority of the USACE would be impacted by the proposed geotechnical investigations (Table 2; Exhibit 2). This represents impacts to WOTUS within Irvine Lake. One test pit (i.e., TP-3a) and all 14 vibracore samples are located within Irvine Lake; this totals 15 locations within USACE jurisdiction. Nationwide Permit (NWP) 6 allows for the loss[2] of less than 0.10 acre of WOTUS for the purpose of geotechnical investigations. IRWD will obtain a NWP 6 prior to initiating geotechnical investigations.

Regional Water Quality Control Board (RWQCB)

A total of 0.149 acre of wetland waters of the State, including 742 linear feet (717 feet along access roads and 25 feet total for all geotechnical locations), under the regulatory authority of the RWQCB would be impacted by the proposed geotechnical investigations (Table 2, Exhibit 3). This represents impacts to waters of the State within Irvine Lake. One test pit (i.e., TP-3a) and all 14 vibracore samples are located within Irvine Lake; this totals 15 locations within RWQCB jurisdiction. IRWD will obtain a Section 401 Water Quality Certification, consistent with NWP 6, prior to initiating geotechnical investigations.

CDFW

A total of 0.635 acre of waters, including 3,048 linear feet (2,883 feet along access roads and 165 feet total for all geotechnical locations), under the regulatory authority of CDFW would be impacted by the proposed geotechnical investigations (Table 2, Exhibit 4). This represents impacts to waters under the authority of CDFW within and adjacent to Irvine Lake. Both hollow stem augers (i.e., HSA-1, HAS-2), 6 test pits (i.e., TP-1, TP-2, TP-2a, TP-3, TP-3a, and TP-4), and all 14 vibracore samples are located within Irvine Lake; this totals 22 locations within CDFW jurisdiction. A Streambed Alteration Agreement will be obtained to allow for the loss of CDFW jurisdiction prior to initiating geotechnical investigations.

[2] Refers to permanent impacts.

TABLE 2
GEOTECHNICAL IMPACTS ON
JURISDICTIONAL RESOURCES

		Total: 3,048

USACE: U.S. Army Corps of Engineers; WOTUS: waters of the United States; RWQCB: Regional Water Quality Control Board; CDFW: California Department of Fish and Wildlife.

Wildlife Habitat

The geotechnical investigations locations were adjusted to avoid native vegetation types; they would only impact ruderal vegetation and vegetated fluctuating shoreline. There would be limited disturbance to these habitat types while many acres of native habitats would remain immediately adjacent to the areas that would be disturbed (over 1,015 acres of habitat remaining in the Project's Biological Study Area [BSA]). Any wildlife disturbed by the proposed activities could move to areas of habitat immediately adjacent to the areas of disturbance. The work would be temporary in nature (approximately two weeks total, with work at each location occurring for one or two days). Wildlife may move away from the disturbance and human activity temporarily but would be expected to return following completion of the geotechnical investigations. Therefore, the impact of the proposed geotechnical investigations would be considered less than significant on wildlife.

Work would occur only during daylight hours; wildlife would be expected to continue to use all areas of the Project site for wildlife movement at night, including areas within the proposed geotechnical investigation area.

It is expected that work at each test pit would be completed within one day. If the work extended over multiple days, the test pits would be covered at the completion of work each day. This would ensure that no wildlife fall into the trench and become entrapped when work is not occurring. While the loss of a few individuals of common wildlife species (e.g., western fence lizard) would not be considered significant, the loss of individuals would be avoided and minimized during the geotechnical investigation activities.

Nesting Birds

The geotechnical investigations would occur outside the nesting season (i.e., September 16 to February 14); therefore, there would be no impact on nesting birds.

Special Status Plant Species

Focused surveys were conducted for special status plant species; details of the results are included in the Biological Technical Report (Psomas 2024a). Mud nama (*Nama stenocarpa*) was observed in the southern portion of the lake during the 2022 focused surveys. Mud nama has a California Rare Plant Rank of 2B.2; it is not a Covered species in the Central Coastal NCCP/HCP. The area where mud nama was observed experiences periodic inundation and was mapped as open water during the 2020 vegetation mapping upstream of the dam. At the time of the special status plant survey, the substrate was exposed and consisted of riparian herb vegetation; the species was growing in more open areas, including along disturbed roads/trails. Individuals covered a large area, and the species is small in stature. To estimate the population sizes, ten quadrats one-square-foot in size were sampled in a relatively dense population of mud nama. This resulted in an average of 37.7 individuals per square foot and the total population was estimated to be between 3.5 and 5.5 million (Psomas 2024a). The proposed geotechnical investigations would impact only 0.09 square foot of mud nama, which equates to 3 individuals. Given the amount of mud nama present in the BSA, the loss of three individuals would be considered less than significant. Therefore, no mitigation would be required.

Special Status Wildlife Species

Focused surveys for the following special status wildlife were conducted upstream of the dam: Quino checkerspot, Crotch's bumble bee, arroyo toad, southwestern pond turtle, coastal California gnatcatcher, least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo. Details on the methods and results of the focused surveys are included in the Biological Technical Report for the Project (Psomas 2024a). This section focuses on high status species (i.e., Threatened, Endangered, or Candidate species) because those species would be the ones that could trigger a significant impact.

Quino checkerspot, arroyo toad, southwestern willow flycatcher, and western yellow-billed cuckoo would not be expected to occur in the geotechnical investigation areas because they were not observed during focused surveys.

Crotch bumble bee was observed foraging in coastal sage scrub habitat on the southern side of the lake and has potential to occur in the geotechnical investigation areas. While there would be a limited amount of foraging habitat loss (0.50 acre of ruderal), many acres of similar habitats would remain immediately adjacent to the areas that would be disturbed (over 1,015 acres of habitat remaining in the BSA). The proposed geotechnical activities would occur outside the breeding season of the Crotch bumble bee; therefore, if there are bees present in the immediate area, the geotechnical activities would not affect nesting.

Coastal California gnatcatcher is known to occur in coastal sage scrub habitats in the BSA and could occur adjacent to the geotechnical investigation areas. No coastal sage scrub would be

directly impacted by the geotechnical investigations. As an avoidance and minimization measure, a Biological Monitor will be present throughout the geotechnical work.

Least Bell's vireo is known to occur in riparian habitats in the BSA adjacent to the geotechnical investigations area. No riparian habitat would be directly impacted by the geotechnical investigations. Additionally, the geotechnical investigations would occur outside the breeding season (i.e., September 16 to February 14) when least Bell's vireo would be on its wintering grounds. Therefore, the noise from geotechnical investigations would not affect least Bell's vireo since it would not be present when the geotechnical investigations are planned to occur.

Mountain lion may occur in the BSA and may forage in the area where geotechnical activities would occur. As mentioned above under wildlife movement, the proposed geotechnical activities would occur during daylight hours and would not interfere with foraging by this nocturnal species. The mountain lion would be expected to continue to use the proposed work area for foraging and wildlife movement at night throughout the duration of the proposed geotechnical activities.

Several other special status amphibians, reptiles, birds, and mammals have potential to occur within the impact area for the geotechnical investigations. No roosting habitat for bat species is present in the geotechnical investigations area (e.g., structures, large trees); roosting habitat is present in the vicinity and special status bats may forage in the geotechnical investigations area. While there would be a limited temporary loss of low-quality habitat (0.50 acre ruderal and 0.50 acre vegetated fluctuating shoreline) following the geotechnical investigations, many acres of similar or higher-quality habitats would remain immediately adjacent to the areas that would be disturbed (over 1,015 acres of habitat remaining in the BSA). Therefore, the impact on other special status amphibians, reptiles, birds, and mammals would be less than significant, and no mitigation would be required.

Indirect Impacts

Noise Impacts

The BSA includes some periodic noise events, including consistent low helicopter flights and landings and periodic special events in the adjacent park (e.g., concerts). Noise levels in the BSA would increase over present levels during geotechnical investigations due to construction vehicles. Temporary noise impacts have the potential to disrupt foraging, nesting, roosting, and denning activities for a variety of wildlife species. Temporary noise from geotechnical activities may cause birds adjacent to the work area to temporarily leave the area or may discourage individuals from selecting habitat adjacent to the work area due to construction vehicle noise and human activity. These impacts are considered adverse, but not significant for most wildlife species, because the Project would not impact a substantial population of these species and because work is planned to occur outside the breeding season.

Geotechnical activities would create noise and human activity adjacent to areas of coastal sage scrub occupied by the coastal California gnatcatcher and open water used for foraging by the bald eagle; however, work is planned to occur outside the breeding season (i.e., September 16 to February 14). Coastal California gnatcatchers and bald eagles may move away from the disturbance and human activity temporarily but would be expected to return following

completion of the geotechnical investigations. Therefore, indirect impacts would be considered adverse, but less than significant, for work conducted outside the breeding season.

Increased Dust

Geotechnical activities would disturb soils and result in the accumulation of dust on the surface of the leaves of trees, shrubs, and herbs. The respiratory function of the plants in the area would be impaired when dust accumulation is excessive. This indirect effect of dust as a result of geotechnical activities is considered less than significant because it would only affect a limited area and would not substantially reduce plant populations in the region. Therefore, no mitigation would be required.

Water Quality

During geotechnical activities, excess silt, petroleum, or chemicals on the soil surface within the geotechnical investigations area could be washed into drainages and may affect areas downstream of the geotechnical activities (i.e., Irvine Lake). Adverse effects on water quality could indirectly impact species that use riparian areas within the watershed by affecting the food web interactions (e.g., abundance of insects or other prey) or through biomagnification (i.e., the buildup of chemicals in body tissues to toxic levels in higher trophic levels). To be compliant with regulatory requirements, the geotechnical investigations would implement Best Management Practices and erosion control measures to prevent the runoff of toxins, chemicals, petroleum products, or other elements that might degrade water quality. Assuming compliance with standard regulatory requirements, impacts on water quality would be less than significant, and no mitigation would be required.

Invasive Exotic Plant Species

Geotechnical activities create disturbance, which in turn provides a place for non-native weedy species to spread. As discussed previously, construction equipment would be washed prior to arrival on the site to ensure equipment would not introduce non-native weed seeds to the area. The use of Best Management Practices associated with prevention of the spread of weed seeds would result in an impact that is less than significant. Additionally, a native seed mix will be used for hydroseeding areas temporarily disturbed by construction activities (following the Project's construction).

Night Lighting

Geotechnical activities would occur during the day. Therefore, there would be no impact due to night lighting, and no mitigation would be required.

Human Activity

During geotechnical investigations, there would be a small increase in human activity (i.e., vehicle and foot traffic), which would increase the disturbance of natural open space adjacent to the geotechnical investigations area. Human disturbance could disrupt normal foraging behavior of wildlife adjacent to the geotechnical investigation area. However, as discussed above, wildlife may move away from the disturbance and human activity temporarily but would be expected to return following completion of the geotechnical investigations. A WEAP training would be

conducted by the Biological Monitor to ensure that geotechnical personnel are trained on the environmental sensitivity of the area.

Increased Wildfire Risk

During geotechnical investigations, construction equipment or personal vehicles have potential to accidentally ignite vegetation, starting a wildfire. Additionally, construction personnel may dispose of cigarettes inappropriately in the geotechnical investigations area and could ignite dry vegetation. If not contained quickly, the fire could spread through adjacent habitat areas. As discussed previously, a WEAP training will be conducted by the Biological Monitor to ensure that geotechnical personnel are trained on the environmental sensitivity of the area.

Mitigation

The Project Draft EIR (Psomas [in preparation]) includes compensatory mitigation for the loss of jurisdictional resources. These habitats would be mitigated at a minimum 1:1 ratio through use of one of the following options: (1) preservation, restoration, and/or enhancement of on-site habitats; or (2) preservation, restoration, or enhancement of off-site habitats. IRWD have initiated consultation with the resource agencies to negotiate appropriate mitigation for the loss of these resources as a result of the Project, as consistent with the Clean Water Act, California Fish and Game Code, and the federal and State Endangered Species Acts.

Project Name: Santiago Creek Dam Improvements Project

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A biological assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological

evaluation similar to a biological assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a biological assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found at the Fish and Wildlife Service's Endangered Species Consultation website at:

https://www.fws.gov/service/esa-section-7-consultation

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see https://www.fws.gov/program/migratory-bird-permit/what-we-do.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see https://www.fws.gov/library/collections/threats-birds.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

- Official Species List

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

PROJECT SUMMARY

Project Code: 2023-0055398

Project Name: Santiago Creek Dam Improvements Project

Project Type: Dam - Maintenance/Modification

Project Description: The Project is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County. Irvine Ranch Water District (IRWD) operates Irvine Lake (and the Santiago Creek Dam) to serve as a critical water supply reservoir. Santiago Creek Dam is a compacted earthfill embankment completed in 1933 and certified by the State of California, Department of Water Resources (DWR), Division of Safety of Dams (DSOD).

The primary objective of the Project is the rehabilitation and replacement of the Santiago Creek Dam outlet tower and spillway facilities, as well as to modify the dam embankment to permit operation of the facilities for a long-term water resource benefit. The Project would also raise the spillway two feet, which would result in a small increase in maximum inundation area of the reservoir. In implementing the Project, the Districts would: (1) create new facilities and dam embankment modifications that will meet or exceed the current seismic, safety and design requirements; (2) satisfy IRWD's operational requirements in the present and future; (3) extend the useful life of the facilities; (4) improve water supply reliability; and (5) minimize impacts to local environmental resources and surrounding property owners.

Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@33.775968,-117.7096687758396,14z

Counties: Orange County, California

ENDANGERED SPECIES ACT SPECIES

There is a total of 12 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

BIRDS

NAME	STATUS
Coastal California Gnatcatcher *Polioptila californica californica* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/8178	Threatened
Least Bell's Vireo *Vireo bellii pusillus* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/5945	Endangered
Southwestern Willow Flycatcher *Empidonax traillii extimus* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/6749	Endangered

REPTILES

APPENDIX D

PLANT AND WILDLIFE COMPENDIA

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
FERNS	
POLYPODIACEAE – POLYPODY FAMILY	
Polypodium californicum	California polypody
PTERIDACEAE – BRAKE FAMILY	
Pellaea andromedifolia	coffee fern
Pentagramma triangularis	goldback fern
SELAGINELLACEAE – SPIKE–MOSS FAMILY	
Selaginella bigelovii	Bigelow's spike-moss
GYMNOSPERMS	
PINACEAE – PINE FAMILY	
*Pinus sp.**	pine
EUDICOTS	
ADOXACEAE – MUSKROOT FAMILY	
Sambucus mexicana	blue elderberry
AIZOACEAE – FIG–MARIGOLD FAMILY	
*Carpobrotus edulis**	freeway iceplant
AMARANTHACEAE – AMARANTH FAMILY	
*Amaranthus albus**	tumbleweed
ANACARDIACEAE – SUMAC FAMILY	
Malosma laurina	laurel sumac
Rhus integrifolia	lemonade berry
Rhus ovata	sugar bush
*Schinus molle**	pepper tree
Toxicodendron diversilobum	western poison oak
APIACEAE – CARROT FAMILY	
Daucus pusillus	small daucus
*Foeniculum vulgare**	fennel
*Torilis nodosa**	short sock-destroyer
APOCYNACEAE – DOGBANE FAMILY	
Asclepias fascicularis	narrow-leaf milkweed
ASTERACEAE – SUNFLOWER FAMILY	
Acourtia microcephala	small-headed acourtia
Ambrosia acanthicarpa	annual bur-sage
Ambrosia psilostachya	western ragweed
Artemisia californica	California sagebrush
Baccharis pilularis ssp. *consanguinea*	coyote brush
Baccharis salicifolia ssp. *salicifolia*	mule fat
Baccharis sarothroides	broom baccharis
Bebbia juncea var. aspera	rough rush-like sweetbush
Brickellia californica	California brickellbush

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
Carduus pycnocephalus ssp. *pycnocephalus**	Italian thistle
*Centaurea melitensis**	tocalote
Chaenactis artemisiifolia	white pincushion
Chaenactis glabriuscula	yellow pincushion
Cirsium occidentale	cobwebby thistle
*Cirsium vulgare**	bull thistle
Corethrogyne filaginifolia	filago-leaved sand-aster
*Cotula australis**	Australian cotula
Cynara cardunculus ssp. *cardunculus**	artichoke
Deinandra fasciculata	fascicled tarplant
Eclipta prostrata	false daisy
Encelia californica	California encelia
Encelia farinosa	brittlebush
Ericameria palmeri var. pachylepis	thickbracted goldenbush
*Erigeron bonariensis**	flax-leaved horseweed
Erigeron canadensis	horseweed
Erigeron foliosus	leafy fleabane
Eriophyllum confertiflorum var. confertiflorum	golden-yarrow
Filago gallica	Daggerleaf cottonrose
*Gazania linearis**	parallel-sided treasure flower
Grindelia camporum	field gumplant
Hazardia squarrosa	saw-toothed goldenbush
*Hedypnois rhagadioloides**	Crete weed
Helianthus annuus	annual sunflower
Helianthus gracilentus	slender sunflower
*Helminthotheca echioides**	bristly ox-tongue
Heterotheca grandiflora	telegraph weed
Heterotheca sessiliflora ssp. *echioides*	Viper's sessileflower goldenaster
*Hypochaeris glabra**	smooth cat's-ear
Isocoma menziesii	coastal goldenbush
*Lactuca serriola**	prickly lettuce
Lasthenia gracilis	common goldfields
Lepidospartum squamatum	scaly scale-broom
Logfia filaginoides	California cottonrose
*Logfia gallica**	daggerleaf cottonrose
Madia exigua	small tarweed
Madia gracilis	gumweed
Malacothrix saxatilis	rocky malacothrix
*Matricaria discoidea**	pineapple weed
*Oncosiphon piluliferum**	stinknet

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
Osmadenia tenella	osmadenia
Pluchea sericea	arrow-weed
Pseudognaphalium biolettii	Bioletti's cudweed
Pseudognaphalium californicum	California cudweed
Pseudognaphalium canescens	hairy everlasting
*Pseudognaphalium luteoalbum**	white lamb cudweed
Pseudognaphalium stramineum	straw-colored cudweed
Psilocarphus brevissimus var. brevissimus	dwarf woollyheads
*Pulicaria paludosa**	marsh pulicaria
Rafinesquia californica	California chicory
*Senecio vulgaris**	common groundsel
*Silybum marianum**	milk thistle
Sonchus asper ssp. *asper**	prickly sow thistle
*Sonchus oleraceus**	common sow thistle
Stephanomeria diegensis	San Diego stephanomeria
Stephanomeria virgata	wand-like stephanomeria
Stylocline gnaphaloides	everlasting neststraw
*Taraxacum officinale**	common dandelion
Uropappus lindleyi	Lindley's silverpuffs
Xanthium strumarium	cocklebur
BETULACEAE – BIRCH FAMILY	
Alnus rhombifolia	white alder
BORAGINACEAE – BORAGE FAMILY	
Amsinckia intermedia	common fiddleneck
Amsinckia menziesii	common fiddleneck
Cryptantha intermedia	intermediate cryptantha
Cryptantha sp.	cryptantha
Emmenanthe penduliflora	whispering bells
Eriodictyon crassifolium var. *crassifolium*	thick-leaved yerba santa
Eucrypta chrysanthemifolia	chrysanthemum-leaved eucrypta
Heliotropium curassavicum var. *oculatum*	seaside heliotrope
Nama stenocarpa	mud nama
Pectocarya linearis ssp. *ferocula*	narrow-toothed pectocarya
Phacelia cicutaria	cicuta-leaved phacelia
Phacelia parryi	Parry's phacelia
Pholistoma auritum var. *auritum*	fiesta flower
Plagiobothrys canescens	valley popcornflower
BRASSICACEAE – MUSTARD FAMILY	
*Brassica nigra**	black mustard
*Hirschfeldia incana**	grayish shortpod mustard

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
*Lepidium didymum**	lesser swine grass
*Lepidium latifolium**	perennial pepperweed
Nasturtium officinale	water cress
*Raphanus sativus**	radish
Rorippa sp.	yellow cress
*Sisymbrium irio**	London rocket
*Sisymbrium orientale**	eastern sisymbrium
CACTACEAE – CACTUS FAMILY	
Opuntia littoralis	seaside prickly-pear
Opuntia ×vaseyi	Vasey's prickly-pear
CARYOPHYLLACEAE – PINK FAMILY	
*Silene gallica**	small-flower catchfly
Silene laciniata	torn catchfly
*Stellaria media**	common chickweed
CHENOPODIACEAE – GOOSEFOOT FAMILY	
Chenopodium californicum	California goosefoot
*Salsola tragus**	Russian thistle
CONVOLVULACEAE – MORNING–GLORY FAMILY	
Calystegia macrostegia	large-bracted morning-glory
Cuscuta californica	chaparral dodder
CRASSULACEAE – STONECROP FAMILY	
Crassula connata	pygmy-weed
Dudleya lanceolata	lance-leaved dudleya
Dudleya multicaulis	many-stemmed dudleya
Dudleya pulverulenta	chalk dudleya
CUCURBITACEAE – GOURD FAMILY	
Cucurbita foetidissima	buffalo gourd
Marah macrocarpa	chilicothe
EUPHORBIACEAE – SPURGE FAMILY	
Croton californicus	California croton
Croton setiger	turkey-mullein
Euphorbia albomarginata	rattlesnake sandmat
*Euphorbia peplus**	petty spurge
*Ricinus communis**	common castor bean
FABACEAE – LEGUME FAMILY	
Acmispon americanus var. americanus	American deervetch
Acmispon glaber	deerweed
Acmispon maritimus	coastal deervetch
Acmispon micranthus	small-flowered deervetch
Astragalus brauntonii	Braunton's milkvetch

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
Astragalus pomonensis	Pomona milkvetch
*Cytisus multiflorus**	Spanish broom
Lupinus bicolor	miniature lupine
Lupinus hirsutissimus	stinging lupine
Lupinus sparsiflorus	Coulter's lupine
Lupinus succulentus	arroyo lupine
Lupinus truncatus	cut leaf lupine
*Medicago polymorpha**	variable burclover
*Melilotus albus**	white sweetclover
*Melilotus indicus**	sourclover
*Robinia pseudoacacia**	black locust
Trifolium willdenovii	tomcat clover
Vicia sp.	vetch
FAGACEAE – OAK FAMILY	
Quercus agrifolia	coast live oak
GERANIACEAE – GERANIUM FAMILY	
*Erodium botrys**	long-beaked filaree
*Erodium cicutarium**	redstem filaree
Geranium carolinianum	Carolina geranium
GROSSULARIACEAE – GOOSEBERRY FAMILY	
Ribes speciosum	fuchsia-flowered gooseberry
LAMIACEAE – MINT FAMILY	
*Marrubium vulgare**	common horehound
Salvia apiana	white sage
Salvia columbariae	chia
Salvia mellifera	black sage
Trichostema lanceolatum	vinegar weed
LOASACEAE – BLAZING STAR FAMILY	
Mentzelia micrantha	small-flowered blazing star
MALVACEAE – MALLOW FAMILY	
Malacothamnus fasciculatus var. *fasciculatus*	chaparral mallow
*Malva parviflora**	cheeseweed
Malvella leprosa	alkali-mallow
MELIACEAE – MAHOGANY FAMILY	
*Melia azedarach**	china berry
MONTIACEAE – MINER'S–LETTUCE FAMILY	
Calandrinia menziesii	red maids
Claytonia perfoliata	miner's lettuce
MYRSINACEAE – MYRSINE FAMILY	
*Lysimachia arvensis**	scarlet pimpernel

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
MYRTACEAE – MYRTLE FAMILY	
Eucalyptus spp.*	gum tree
NYCTAGINACEAE – FOUR O'CLOCK FAMILY	
Mirabilis laevis var. *crassifolia*	wishbone bush
OLEACEAE – OLIVE FAMILY	
*Olea europaea**	European olive
ONAGRACEAE – EVENING PRIMROSE FAMILY	
Camissoniopsis micrantha	small-flowered camissoniopsis
Clarkia epilobioides	epilobium-like clarkia
Clarkia purpurea	purple clarkia
Clarkia purpurea ssp. *quadrivulnera*	four-spot
Epilobium ciliatum	fringed willowherb
Gayophytum sp.	gayophytum
OROBANCHACEAE – BROOM–RAPE FAMILY	
Castilleja exserta	purple owl's-clover
Cordylanthus rigidus ssp. setiger	bristly rigid bird's-beak
OXALIDACEAE – OXALIS FAMILY	
*Oxalis pes-caprae**	Bermuda buttercup
PAEONIACEAE – PEONY FAMILY	
Paeonia californica	California peony
PAPAVERACEAE – POPPY FAMILY	
Eschscholzia californica	California poppy
Romneya coulteri	Coulter's matilija poppy
PHRYMACEAE – LOPSEED FAMILY	
Diplacus australis	southern monkeyflower
Diplacus longiflorus	long-flowered monkeyflower
Erythranthe cardinalis	scarlet monkeyflower
Erythranthe guttata	common monkeyflower
PINACEAE – PINE FAMILY	
Pinus sp.*	pine
PLANTAGINACEAE – PLANTAIN FAMILY	
Antirrhinum nuttallianum	Nuttall's snapdragon
Keckiella antirrhinoides	antirrhinum-like bush penstemon
Keckiella cordifolia	heart-leaved bush penstemon
Plantago erecta	erect plantain
*Veronica anagallis-aquatica**	water speedwell
PLATANACEAE – SYCAMORE FAMILY	
Platanus racemosa	western sycamore

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
POLEMONIACEAE – PHLOX FAMILY	
Gilia angelensis	chaparral gilia
Linanthus dianthiflorus	carnation-like linanthus
POLYGONACEAE – BUCKWHEAT FAMILY	
Eriogonum fasciculatum	California buckwheat
Persicaria lapathifolia	willow weed
*Polygonum aviculare**	knotweed
Pterostegia drymarioides	fairy mist
*Rumex crispus**	curly dock
RANUNCULACEAE – BUTTERCUP FAMILY	
Delphinium parryi ssp. *parryi*	Parry's larkspur
RHAMNACEAE – BUCKTHORN FAMILY	
Rhamnus ilicifolia	hollyleaf redberry
ROSACEAE – ROSE FAMILY	
Adenostoma fasciculatum	chamise
Heteromeles arbutifolia	toyon
RUBIACEAE – COFFEE FAMILY	
Galium angustifolium ssp. *angustifolium*	narrow-leaved bedstraw
Galium aparine	goose grass
SALICACEAE – WILLOW FAMILY	
Populus fremontii ssp. *fremontii*	Fremont cottonwood
Salix exigua	narrow-leaved willow
Salix gooddingii	Goodding's black willow
Salix laevigata	red willow
Salix lasiolepis	arroyo willow
SCROPHULARIACEAE – FIGWORT FAMILY	
Scrophularia californica	California figwort
Verbascum sp.*	mullein
SOLANACEAE – NIGHTSHADE FAMILY	
Datura wrightii	Wright's jimsonweed
*Nicotiana glauca**	tree tobacco
Solanum americanum	American nightshade
Solanum douglasii	Douglas' nightshade
Solanum umbelliferum	umbelled nightshade
Solanum xanti	Xantus' nightshade
TAMARICACEAE – TAMARISK FAMILY	
*Tamarix ramosissima**	saltcedar
URTICACEAE – NETTLE FAMILY	
*Urtica urens**	dwarf nettle

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
VERBENACEAE – VERVAIN FAMILY	
Phyla nodiflora	node-flowered phyla
Verbena bracteata	bracted vervain
Verbena lasiostachys	woolly-flowered vervain
VIOLACEAE – VIOLET FAMILY	
Viola pedunculata	Johnny-jump-up
VISCACEAE – MISTLETOE FAMILY	
Phoradendron leucarpum	American mistletoe
MONOCOTS	
AGAVACEAE – AGAVE FAMILY	
Chlorogalum sp.	soap plant
Hesperoyucca whipplei	Whipple's chaparral yucca
ALISMATACEAE – WATER–PLANTAIN FAMILY	
Echinodorus berteroi	Bertero's burhead
ARECACEAE – PALM FAMILY	
*Washingtonia robusta**	Mexican fan palm
CYPERACEAE – SEDGE FAMILY	
Cyperus sp.	flatsedge
Eleocharis sp.	spikerush
IRIDACEAE – IRIS FAMILY	
Sisyrinchium bellum	western blue-eyed-grass
JUNCACEAE – RUSH FAMILY	
Juncus bufonius	toad rush
Juncus mexicanus	Mexican rush
Juncus xiphioides	iris-leaved rush
LILIACEAE – LILY FAMILY	
Calochortus splendens	splendid mariposa lily
Calochortus weedii var. *intermedius*	intermediate mariposa-lily
POACEAE – GRASS FAMILY	
*Arundo donax**	giant reed
*Avena barbata**	slender wild oat
*Avena fatua**	wild oat
Bothriochloa barbinodis	cane bluestem
*Brachypodium distachyon**	two-corn false brome
*Bromus diandrus**	ripgut grass
*Bromus hordeaceus**	soft chess
*Bromus rubens**	red brome
*Cortaderia selloana**	pampas grass
*Crypsis schoenoides**	swamp prickle grass
*Cynodon dactylon**	Bermuda grass

PLANT SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
Elymus condensatus	giant wild-rye
Elymus triticoides	beardless wild rye
*Festuca myuros**	rattail sixweeks grass
*Festuca perennis**	rye grass
*Gastridium phleoides**	nit grass
*Hordeum murinum**	wall barley
*Lamarckia aurea**	goldentop
Melica imperfecta	little California melica
Muhlenbergia microsperma	littleseed muhly
*Pennisetum setaceum**	crimson fountain grass
*Polypogon monspeliensis**	annual beard grass
*Polypogon viridis**	water beard grass
*Schismus barbatus**	barbed Mediterranean grass
Stipa lepida	foothill needle grass
Stipa miliacea var. *miliacea**	smilo grass
Stipa pulchra	purple needle grass
THEMIDACEAE – BRODIAEA FAMILY	
Bloomeria crocea	common goldenstar
Dipterostemon capitatus	blue dicks
TYPHACEAE – CATTAIL FAMILY	
Typha domingensis	southern cattail
Typha latifolia	broad-leaved cattail

CRPR: California Rare Plant Rank

WILDLIFE SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
INVERTEBRATES	
PAPILIONIDAE - SWALLOWTAIL BUTTERFLIES	
Papilio eurymedon	pale swallowtail
Papilio rutulus	western tiger swallowtail
Papilio zelicaon	anise swallowtail
PIERIDAE - WHITES, SULFURS AND ORANGETIPS	
Anthocharis sara	Sara's orangetip
Pieris rapae	cabbage white
Pontia protodice	common (checkered) white
Colias harfordii	Harford's sulfer
NYMPHALIDAE - BRUSH-FOOTED BUTTERFLIES	
Vanessa cardui	painted lady
DANAIDAE - MILKWEED BUTTERFLIES	
Danaus plexippus	monarch
HESPERIDAE - SKIPPERS	
Pyrgus albescens	white checkered-skipper
Erynnis funeralis	funereal duskywing
RIODINIDAE - METALMARKS	
Apodemia mormo	Behr's (Mormon) metalmark
LYCAENIDAE - BLUES, HAIRSTREAKS AND COPPERS	
Plebejus acmon	acmon blue
Brephidium exilis	western pygmy-blue
Leptotes marina	marine blue
FISH	
CYPRINIDAE – MINNOW FAMILY	
*Cyprinus carpio**	common carp
ICTALURIDAE – BULLHEAD CATFISH FAMILY	
Ictalurus sp.*	catfish
SALMONIDAE – SALMON AND TROUT FAMILY	
Oncorhynchus mykiss	rainbow trout
CENTRARCHIDAE – SUNFISH FAMILY	
*Lepomis macrochirus**	bluegill
Pomoxis sp.*	crappie
Micropterus sp.*	bass
AMPHIBIANS	
BUFONIDAE – TRUE TOAD FAMILY	
Anaxyrus boreas	western toad
RANIDAE – TRUE FROG FAMILY	
*Lithobates catesbeianus**	American bullfrog

WILDLIFE SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
HYLIDAE – TREEFROG FAMILY	
Pseudacris cadaverina	California treefrog
Pseudacris hypochondriaca	Baja California treefrog
LIZARDS	
PHRYNOSOMATIDAE –SPINY LIZARD FAMILY	
Sceloporus occidentalis	western fence lizard
Uta stansburiana	common side-blotched lizard
TEIIDAE – WHIPTAIL LIZARD FAMILY	
Aspidoscelis hyperythra beldingi	Belding's orange-throated whiptail
Aspidoscelis tigris stejnegeri	coastal whiptail
SNAKES	
COLUBRIDAE - COLUBRID SNAKE FAMILY	
Coluber flagellum piceus	red racer
Pituophis catenifer	gopher snake
NATRICIDAE – HARMLESS LIVE-BEARING SNAKE FAMILY	
Thamnophis hammondii	two-striped garter snake
BIRDS	
ANATIDAE – SWAN, GOOSE, AND DUCK FAMILY	
Branta canadensis	Canada goose
Mareca americana	American wigeon
Spatula cyanoptera	cinnamon teal
Spatula clypeata	northern shoveler
Anas platyrhynchos	mallard
Aythya affinis	lesser scaup
Bucephala albeola	bufflehead
Oxyura jamaicensis	ruddy duck
ODONTOPHORIDAE – NEW WORLD QUAIL FAMILY	
Callipepla californica	California quail
PODICIPEDIDAE – GREBE FAMILY	
Podilymbus podiceps	pied-billed grebe
Aechmophorus occidentalis	western grebe
Aechmophorus clarkii	Clark's grebe
COLUMBIDAE – PIGEON AND DOVE FAMILY	
*Columba livia**	rock pigeon
*Streptopelia decaocto**	Eurasian collared-dove
Zenaida macroura	mourning dove
CUCULIDAE – CUCKOO AND ROADRUNNER FAMILY	
Geococcyx californianus	greater roadrunner
CAPRIMULGIDAE – NIGHTJAR FAMILY	
Chordeiles acutipennis	lesser nighthawk

WILDLIFE SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
Phalaenoptilus nuttallii	common poorwill
APODIDAE – SWIFT FAMILY	
Aeronautes saxatalis	white-throated swift
TROCHILIDAE – HUMMINGBIRD FAMILY	
Archilochus alexandri	black-chinned hummingbird
Calypte anna	Anna's hummingbird
Calypte costae	Costa's hummingbird
Selasphorus rufus	rufous hummingbird
Selasphorus sasin	Allen's hummingbird
RALLIDAE –RAIL AND COOT FAMILY	
Fulica americana	American coot
CHARADRIIDAE – PLOVER FAMILY	
Charadrius vociferus	killdeer
SCOLOPACIDAE – SANDPIPER FAMILY	
Calidris minutilla	least sandpiper
Calidris mauri	western sandpiper
Actitis macularius	spotted sandpiper
Gallinago delicata	Wilson's snipe
LARIDAE – GULL AND TERN FAMILY	
Larus delawarensis	ring-billed gull
Larus occidentalis	western gull
Hydroprogne caspia	Caspian tern
Sterna forsteri	Forster's tern
Thalasseus elegans	elegant tern
PHALACROCORACIDAE – CORMORANT FAMILY	
Phalacrocorax auritus	double-crested cormorant
PELECANIDAE – PELICAN FAMILY	
Pelecanus erythrorhynchos	American white pelican
ARDEIDAE – HERON FAMILY	
Ardea herodias	great blue heron
Ardea alba	great egret
Egretta thula	snowy egret
CATHARTIDAE – NEW WORLD VULTURE FAMILY	
Cathartes aura	turkey vulture
PANDIONIDAE - OSPREY FAMILY	
Pandion haliaetus	osprey
ACCIPITRIDAE – HAWK FAMILY	
Elanus leucurus	white-tailed kite
Haliaeetus leucocephalus	bald eagle
Accipiter striatus	sharp-shinned hawk

WILDLIFE SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
Accipiter cooperii	Cooper's hawk
Buteo lineatus	red-shouldered hawk
Buteo jamaicensis	red-tailed hawk
TYTONIDAE – BARN OWL FAMILY	
Tyto alba	barn owl
STRIGIDAE – TYPICAL OWL FAMILY	
Megascops kennicottii	western screech-owl
Bubo virginianus	great horned owl
PICIDAE – WOODPECKER FAMILY	
Melanerpes formicivorus	acorn woodpecker
Picoides nuttallii	Nuttall's woodpecker
Colaptes auratus	northern flicker
FALCONIDAE – FALCON FAMILY	
Falco sparverius	American kestrel
Falco peregrinus	peregrine falcon
PSITTACIDAE – PARROT FAMILY	
*Amazona viridigenalis**	red-crowned parrot*
TYRANNIDAE – TYRANT FLYCATCHER FAMILY	
Empidonax difficilis	Pacific-slope flycatcher
Sayornis nigricans	black phoebe
Sayornis saya	Say's phoebe
Myiarchus cinerascens	ash-throated flycatcher
Tyrannus vociferans	Cassin's kingbird
VIREONIDAE – VIREO FAMILY	
Vireo bellii pusillus	least Bell's vireo
Vireo gilvus	warbling vireo
CORVIDAE – JAY AND CROW FAMILY	
Aphelocoma californica	California scrub-jay
Corvus brachyrhynchos	American crow
Corvus corax	common raven
ALAUDIDAE - LARK FAMILY	
Eremophila alpestris actia	California horned lark
HIRUNDINIDAE – SWALLOW FAMILY	
Tachycineta bicolor	tree swallow
Stelgidopteryx serripennis	northern rough-winged swallow
Petrochelidon pyrrhonota	cliff swallow
Hirundo rustica	barn swallow
PARIDAE – TITMOUSE FAMILY	
Baeolophus inornatus	oak titmouse

WILDLIFE SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
AEGITHALIDAE – BUSHTIT FAMILY	
Psaltriparus minimus	bushtit
TROGLODYTIDAE – WREN FAMILY	
Troglodytes aedon	house wren
Thryomanes bewickii	Bewick's wren
Campylorhynchus brunneicapillus sandiegensis	coastal cactus wren
POLIOPTILIDAE – GNATCATCHER FAMILY	
Polioptila caerulea	blue-gray gnatcatcher
Polioptila californica	California gnatcatcher
SYLVIIDAE – SILVIID WARBLERS FAMILY	
Chamaea fasciata	wrentit
TURDIDAE – THRUSH FAMILY	
Turdus migratorius	American robin
Sialia mexicana	western bluebird
MIMIDAE – MOCKINGBIRD AND THRASHER FAMILY	
Toxostoma redivivum	California thrasher
Mimus polyglottos	northern mockingbird
STURNIDAE – STARLING FAMILY	
*Sturnus vulgaris**	European starling*
BOMBYCILLIDAE – WAXWING FAMILY	
Bombycilla cedrorum	cedar waxwing
PTILOGONATIDAE – SILKY-FLYCATCHER FAMILY	
Phainopepla nitens	phainopepla
FRINGILLIDAE – FINCH FAMILY	
Haemorhous mexicanus	house finch
Spinus psaltria	lesser goldfinch
Spinus tristis	American goldfinch
Spinus lawrencei	Lawrence's goldfinch
PASSERELLIDAE – NEW WORLD SPARROW FAMILY	
Ammodramus savannarum	grasshopper sparrow
Zonotrichia leucophrys	white-crowned sparrow
Chondestes grammacus	lark sparrow
Pipilo maculatus	spotted towhee
Aimophila ruficeps canescens	Southern California rufous-crowned sparrow
Melozone crissalis	California towhee
Melospiza melodia	song sparrow
Melospiza lincolnii	Lincoln's sparrow
ICTERIIDAE – YELLOW-BREASTED CHAT FAMILY	
Icteria virens	yellow-breasted chat

WILDLIFE SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
ICTERIDAE – BLACKBIRDS AND ORIOLES	
Sturnella neglecta	western meadowlark
Icterus cucullatus	hooded oriole
Icterus bullockii	Bullock's oriole
Agelaius phoeniceus	red-winged blackbird
Molothrus ater	brown-headed cowbird
Quiscalus mexicanus	great-tailed grackle
PARULIDAE – WOOD-WARBLER FAMILY	
Geothlypis trichas	common yellowthroat
Setophaga petechia	yellow warbler
Setophaga coronata	yellow-rumped warbler
Cardellina pusilla	Wilson's warbler
CARDINALIDAE – CARDINALS AND ALLIES	
Piranga ludoviciana	western tanager
Pheucticus melanocephalus	black-headed grosbeak
Passerina caerulea	blue grosbeak
Passerina amoena	lazuli bunting
MAMMALS	
SCIURIDAE – SQUIRREL FAMILY	
*Sciurus niger**	eastern fox squirrel
Otospermophilus beecheyi	California ground squirrel
GEOMYIDAE – POCKET GOPHER FAMILY	
Thomomys bottae	Botta's pocket gopher
CRICETIDAE – NEW WORLD RATS AND MICE FAMILY	
Neotoma bryanti	Bryant's woodrat
Peromyscus sp.	mouse
LEPORIDAE – HARE AND RABBIT FAMILY	
Sylvilagus audubonii	desert cottontail
VESPERTILIONIDAE – VESPERTILIONID BAT FAMILY	
Order Chiroptera	bat
FELIDAE – CAT FAMILY	
Lynx rufus	bobcat (tracks)
Puma concolor	mountain lion (tracks)
CANIDAE – CANID FAMILY	
Canis latrans	coyote (tracks)
Urocyon cinereoargenteus	common gray fox
MEPHITIDAE - SKUNK FAMILY	
Mephitis mephitis	striped skunk
PROCYONIDAE – PROCYONID FAMILY	
Procyon lotor	northern raccoon (tracks)

WILDLIFE SPECIES OBSERVED IN THE BIOLOGICAL STUDY AREA

Species	
Scientific Name	**Common Name**
CERVIDAE – CERVID FAMILY	
Odocoileus hemionus	southern mule deer

* Non-native species

Subject: Results of Special Status Plant Surveys for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Corey:

This Letter Report presents the findings of special status plant surveys conducted in 2020 for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as "the project site") located in Orange County, California. The purpose of the surveys was to determine the presence or absence of special status plant species on the project site.

PROJECT LOCATION AND DESCRIPTION

The Irvine Ranch Water District (IRWD) and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Department of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the early design phase but would be located within the project site provided by IRWD.

Santiago Creek Dam is located at the north end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. The project site is depicted on the U.S. Geological Survey's Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Topography in the center of the project site is relatively flat, with rolling hills to the east and a steep cliff to the west. Elevations range from approximately 657 to 898 feet above mean sea level (msl). Santiago Creek, a blueline stream, occurs on the project site. Surrounding land uses primarily consist of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. Residential development is located west of SR-241.

The project site is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. IRWD is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The following vegetation types and other areas occur on the project site: sagebrush scrub, disturbed sagebrush scrub, disturbed floodplain sage scrub, toyon – sumac chaparral, annual grassland, ruderal, southern willow scrub, mulefat scrub, coast live oak woodland, western sycamore, cliff, open water, ornamental, developed, and disturbed (Exhibit 3). Soils on the project site include Anaheim clay loam, Cieneba-rock outcrop complex, pits, riverwash, rock-outcrop-Cieneba complex, Soboba gravelly loamy sand, Soper gravelly loam, Soper-rock outcrop complex, and Sorrento loam (Exhibit 4).

METHODS

Botanical surveys were floristic in nature and consistent with the protocols created by the California Department of Fish and Wildlife (CDFW 2018). Prior to the 2020 field surveys, a literature search was conducted to identify special status plant species reported from the vicinity of the project site. Sources reviewed include the United States Geological Survey's Black Star Canyon, Orange, Tustin, and El Toro 7.5-minute quadrangles in the California Native Plant Society's Inventory of Rare and Endangered Plants (CNPS 2020) and the CDFW's California Natural Diversity Database (CNDDB) (CDFW 2020a).

Rainfall received in the winter and spring determines the germination of many annual and perennial herb species. The region received approximately 17.7 inches of precipitation between August 2019 and July 2020 (data taken from Irvine – South Coast Valleys Station No. 75) (CIMIS 2020). The average annual precipitation for this area is between 10 and 13 inches.

Reference populations were monitored for annual and difficult-to-detect target species to ensure that the surveys were comprehensive (Table 1). This is especially relevant during periods of unusual rainfall patterns or below average rainfall. If conditions at a nearby reference population are suitable for germination and growth, then it can be inferred that conditions would also be suitable on the project site. Reference populations were not monitored for species with a California Rare Plant Rank (CRPR) of 3 or 4, large perennials (e.g., Tecate cypress [*Hesperocyparis forbesii*] and chaparral nolina [*Nolina cismontana*]) which would be identifiable throughout the year, or for species lacking a publicly accessible reference population.

TABLE 1
REFERENCE POPULATIONS MONITORED IN THE PROJECT REGION

Species	Date Observed	Location	Phenology
Brodiaea filifolia thread-leaved brodiaea	May 15, 2020	San Clemente	in bloom
Calochortus weedii var. *intermedius* intermediate mariposa lily	June 1, 2020	Peters Canyon	in bloom
Dudleya multicaulis many-stemmed dudleya	April 12, 2017	City of Orange	vegetative

Surveys were conducted on April 30, May 21 and June 4, 2020, by Psomas Senior Biologist Allison Rudalevige. The total number of person-hours spent surveying was approximately 15.75 hours. The plant survey area included the entire project site boundary. A systematic survey was conducted in all areas of suitable special status plant habitat in the survey area. All plant species observed were recorded in field notes. Plant species were identified in the field or collected for future identification. Plants were identified to the taxonomic level necessary to determine whether they were a special status species. Plants were identified using taxonomic keys, descriptions, and illustrations in Jepson Flora Project (2020), Baldwin et al. (2012), Hickman (1993), and Munz (1974). Nomenclature of plant taxa conform to the *Special Vascular Plants, Bryophytes, and Lichens List* (CDFW 2020b) for special status species and the Jepson eFlora (Jepson Flora Project 2020) for all other taxa.

Any special status plant species observed in the survey area were mapped on an iPad loaded with Avenza Maps software and data were collected on the number and phenology of individuals (estimated for large populations) and microsite characteristics (e.g., slope, aspect, soil texture, surrounding habitat, and associated species). Representative photographs are included as Attachment A.

SURVEY RESULTS

Table 2 identifies the special status plants reported from the literature review with their status, their potential to occur in the survey area, and the survey results. Intermediate mariposa lily (*Calochortus weedii* var. *intermedius*), many-stemmed dudleya (*Dudleya multicaulis*) and Coulter's matilija poppy (*Romneya coulteri*) were observed during the surveys and are discussed further below. A list of all plants observed in the survey area during special status plant surveys is included in Attachment B.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
chaparral sand-verbena *Abronia villosa* var. *aurita*	—	—	1B.1	Sandy areas in chaparral, coastal scrub, desert dunes.	Not expected to occur; no suitable sandy soils.
Braunton's milk-vetch *Astragalus brauntonii*	FE	—	1B.1	Recent burns or disturbed areas, usually on sandstone with carbonate layers in chaparral, coastal scrub, valley and foothill grassland.	Unknown; can only be observed for a few years following a fire; marginally suitable habitat; reported immediately north of the survey area in 2012 (CDFW 2020a).
Coulter's saltbush *Atriplex coulteri*	—	—	1B.2	Alkaline or clay soils in coastal bluff scrub, coastal dunes, coastal scrub, and valley and foothill grassland.	Not expected to occur; no suitable soils.
south coast saltscale *Atriplex pacifica*	—	—	1B.2	Alkaline soils in coastal scrub, coastal bluff scrub, playas, coastal dunes.	Not expected to occur; no suitable soils.
Davidson's saltscale *Atriplex serenana* var. *davidsonii*	—	—	1B.2	Alkaline soils in coastal bluff scrub, coastal scrub.	Not expected to occur; no suitable soils.
Malibu baccharis *Baccharis malibuensis*	—	—	1B.1	In Conejo volcanic substrates in coastal scrub, chaparral, cismontane woodland, and riparian woodland.	Not expected to occur because not observed during focused surveys; suitable habitat and reported immediately north of the survey area in 2000 (CCH 2020).
thread-leaved brodiaea *Brodiaea filifolia*	FT	SE	1B.1	Chaparral openings, cismontane woodland, coastal scrub, playas, valley and foothill grassland, vernal pools.	Not expected to occur because not observed during focused surveys; suitable habitat.
Brewer's calandrinia *Calandrinia breweri*	—	—	4.2	Sandy or loamy soils in disturbed sites and burns in chaparral and coastal sage scrub.	Not expected to occur because not observed during focused surveys; suitable habitat.
Catalina mariposa lily *Calochortus catalinae*	—	—	4.2	Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland.	Not expected to occur because not observed during focused surveys; suitable habitat.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
Plummer's mariposa-lily *Calochortus plummerae*	—	—	4.2	Rocky and sandy sites, usually of granitic or alluvial material, in coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, lower montane coniferous forest.	Not expected to occur because not observed during focused surveys; suitable habitat.
intermediate mariposa-lily *Calochortus weedii* var. *intermedius*	—	—	1B.2	Dry, rocky calcareous slopes and rock outcrops in coastal scrub, chaparral, valley and foothill grassland.	**Observed in the survey area.**
Lewis' evening-primrose *Camissoniopsis lewisii*	—	—	3	Sand or clay substrate in coastal bluff scrub, cismontane woodland, coastal dunes, coastal scrub, valley and foothill grassland.	Not expected to occur because not observed during focused surveys; suitable habitat.
southern tarplant *Centromadia parryi* ssp. *australis*	—	—	1B.1	Disturbed sites and alkaline soils in marshes and swamp margins, valley and foothill grassland, and vernal pools.	Not expected to occur; no suitable soils.
San Fernando Valley spineflower *Chorizanthe parryi* var. *fernandina*	PT	SE	1B.1	Sandy soils in coastal scrub, valley and foothill grasslands.	Not expected to occur; historic (1902) occurrence within 0.5 mile but outside the current known range of the species (CDFW 2020a).
long-spined spineflower *Chorizanthe polygonoides* var. *longispina*	—	—	1B.2	Gabbroic clay or sandy soil in chaparral, coastal scrub, meadows and seeps, valley and foothill grassland, vernal pools.	Not expected to occur because not observed during focused surveys; suitable habitat but at edge of current known range.
small-flowered morning-glory *Convolvulus simulans*	—	—	4.2	Clay, occasionally serpentine soils in chaparral openings, coastal scrub, valley and foothill grasslands.	Not expected to occur because not observed during focused surveys; suitable habitat and reported just west of Irvine Lake in 2016 (CCH 2020).

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
paniculate tarplant *Deinandra paniculata*	—	—	4.2	Usually vernally mesic, sometimes sandy substrate in coastal scrub, valley and foothill grassland, and vernal pools.	Not expected to occur because not observed during focused surveys; suitable habitat.
slender-horned spineflower *Dodecahema leptoceras*	FE	SE	1B.1	Sandy soil in chaparral, cismontane woodland, and alluvial fan coastal scrub.	Not expected to occur; outside current known range.
Santa Monica Mountains dudleya *Dudleya cymosa* ssp. *ovatifolia*	FT	—	1B.1	Volcanic or sedimentary, rocky sediment in chaparral and coastal scrub.	Not expected to occur because not observed during focused surveys; suitable habitat.
many-stemmed dudleya *Dudleya multicaulis*	—	—	1B.2	Heavy, often clayey soils or grassy slopes in chaparral, coastal scrub, valley and foothill grassland.	**Observed in the survey area.**
Santa Ana River woollystar *Eriastrum densifolium* ssp. *sanctorum*	FE	SE	1B.1	Sandy soils on river floodplains or terraced fluvial deposits in coastal scrub and chaparral.	Not expected to occur; outside current known range (i.e., the Santa Ana River watershed).
Palmer's grapplinghook *Harpagonella palmeri*	—	—	4.2	Clay soils in open grasses areas in chaparral, coastal scrub, and valley and foothill grassland.	Not expected to occur because not observed during focused surveys; suitable habitat.
Los Angeles sunflower *Helianthus nuttallii* ssp. *parishii*	—	—	1A	Coastal and freshwater marshes and swamps.	Not expected to occur; no suitable habitat and presumed extinct.
Tecate cypress *Hesperocyparis forbesii*	—	—	1B.1	Clay or gabbro soils in closed-cone coniferous forest and chaparral.	Not expected to occur; perennial species not observed during survey
vernal barley *Hordeum intercedens*	—	—	3.2	Coastal dunes, coastal scrub, saline flats and depressions of valley and foothill grassland, vernal pools.	Not expected to occur because not observed during focused surveys; marginally suitable habitat but reported just south of Irvine Lake in 1998 (CCH 2020

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
mesa horkelia *Horkelia cuneata* var. *puberula*	—	—	1B.1	Sandy or gravelly soils in chaparral, cismontane woodland, and coastal scrub.	Not expected to occur because not observed during focused surveys; suitable habitat.
Coulter's goldfields *Lasthenia glabrata* ssp. *coulteri*	—	—	1B.1	Usually on alkaline soils in coastal salt marsh, playas, vernal pools.	Not expected to occur because not observed during focused surveys; no suitable habitat but reported from oak woodland in 2008 (CCH 2020).
heart-leaved pitcher sage *Lepechinia cardiophylla*	—	—	1B.2	Closed-cone coniferous forest, chaparral, cismontane woodland.	Not expected to occur; no suitable habitat and outside the current known elevational range.
Robinson's pepper-grass *Lepidium virginicum* var. *robinsonii*	—	—	4.3	Dry soils in chaparral and coastal scrub.	Not expected to occur because not observed during focused surveys; suitable habitat.
ocellated Humboldt lily *Lilium humboldtii* ssp. *ocellatum*	—	—	4.2	Openings in chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and riparian woodland.	Not expected to occur because not observed during focused surveys; suitable habitat.
intermediate monardella *Monardella hypoleuca* ssp. *intermedia*	—	—	1B.3	Chaparral, cismontane woodland, and sometimes lower montane coniferous forest.	Not expected to occur because not observed during focused surveys; suitable habitat.
mud nama *Nama stenocarpa*	—	—	2B.2	Lake shores, riverbanks, intermittently wet areas, marshes, and swamps.	Not expected to occur because not observed during focused surveys; suitable habitat but at edge of current known range.
Gambel's water cress *Nasturtium gambelii*	FE	ST	1B.1	Freshwater and brackish marshes at the martins of lakes and along streams; in or just above the water level.	Not expected to occur because not observed during focused surveys; suitable habitat.
chaparral nolina *Nolina cismontana*	—	—	1B.2	Primarily sandstone and shale substrates in chaparral and coastal scrub	Not expected to occur because not observed during focused surveys; suitable habitat.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
California beardtongue *Penstemon californicus*	—	—	1B.2	Sandy or granitic soils and stony slopes in chaparral, lower montane coniferous forest, pinyon and juniper woodland.	Not expected to occur; no suitable habitat and outside current known range.
Allen's pentachaeta *Pentachaeta aurea* ssp. *allenii*	—	—	1B.1	Openings in coastal scrub and valley and foothill grasslands.	Not expected to occur because not observed during focused surveys; suitable habitat.
woolly chaparral-pea *Pickeringia montana* var. *tomentosa*	—	—	4.3	Gabbroic, granitic, or clay soil in chaparral.	Not expected to occur; no suitable habitat.
Fish's milkwort *Polygala cornuta* var. *fishiae*	—	—	4.3	Chaparral, cismontane woodland, riparian woodland.	Not expected to occur because not observed during focused surveys; suitable habitat.
white rabbit-tobacco *Pseudognaphalium leucocephalum*	—	—	2B.2	Sandy, gravelly areas of riparian woodland, cismontane woodland, coastal scrub, and chaparral.	Not expected to occur because not observed during focused surveys; suitable habitat.
Coulter's matilija poppy *Romneya coulteri*	—	—	4.2	Chaparral and coastal scrub, often in burns.	**Observed in the survey area**.
chaparral ragwort *Senecio aphanactis*	—	—	2B.2	Drying alkaline flats of chaparral, cismontane woodland, coastal scrub.	Not expected to occur; no suitable soils.
salt spring checkerbloom *Sidalcea neomexicana*	—	—	2B.2	Alkali springs and marshes in playas, chaparral, coastal scrub, lower montane coniferous forest, and Mojavean desert scrub.	Not expected to occur; no suitable soils.
estuary seablite *Suaeda esteroa*	—	—	1B.2	Coastal salt marshes in clay, silt, and sand substrates.	Not expected to occur; no suitable habitat.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
San Bernardino aster *Symphyotrichum defoliatum*	—	—	1B.2	Disturbed areas, vernally mesic grassland, or near ditches, streams, and springs in meadows and seeps, cismontane woodland, coastal scrub, lower montane coniferous forest, marshes and swamps, valley and foothill grassland.	Not expected to occur because not observed during focused surveys; suitable habitat.

CRPR: California Rare Plant Rank; NCCP/HCP: Natural Community Conservation Plan/Habitat Conservation Plan

LEGEND:

Federal Status

FE	Endangered
FT	Threatened
PT	Proposed Threatened

State Status

SE	Endangered
ST	Threatened

CRPR

1A	Plants presumed extirpated in California and either rare or extinct elsewhere
1B	Plants Rare, Threatened, or Endangered in California and elsewhere
2B	Plants Rare, Threatened, or Endangered in California but more common elsewhere
3	Plants about which we need more information – A Review List
4	Plants of limited distribution – A Watch List

CRPR Threat Code Extensions

None	Plants lacking any threat information
.1	Seriously threatened in California (over 80% of occurrences threatened; high degree and immediacy of threat)
.2	Fairly threatened in California (20–80% of occurrences threatened; moderate degree and immediacy of threat)
.3	Not very threatened in California (<20% of occurrences threatened; low degree and immediacy of threat or no current threats known)

Species that were observed on site are shown in **boldface type.**

* Sources include CDFW 2020a, CNPS 2020, and Jepson Flora Project 2020.

Intermediate Mariposa Lily

Intermediate mariposa lily has a CRPR of 1B.2. It is a Conditionally Covered species[1] in the Central Coastal NCCP/HCP (i.e., populations less than 20 individuals are fully authorized). It typically blooms between May and July (Jepson Flora Project 2020; CNPS 2020). This perennial bulbiferous herb occurs on dry, rocky, open slopes in chaparral and coastal sage scrub at elevations between sea level and approximately 2,231 feet above msl (Roberts 2008; Jepson Flora Project 2020). It is sometimes locally common following fire (Roberts 2008). This species is known from the South Coast and northern Peninsular Ranges (Jepson Flora Project 2020).

One individual intermediate mariposa lily was observed in the survey area (Exhibit 5). This individual was observed in the eastern portion of the survey area on a moderately steep, south facing slope in disturbed sagebrush scrub with Ceineba-rock outcrop complex soil. The species associated with the intermediate mariposa lily observed in the survey area include California sagebrush (*Artemisia californica*), black mustard (*Brassica nigra*), coast morning glory (*Calystegia macrostegia*) and oats (*Avena* spp.). A voucher specimen was not collected because there was only one individual. A CNDDB form for this species will be submitted online by Ms. Rudalevige and is included in Attachment C.

Many-Stemmed Dudleya

Many-stemmed dudleya has a CRPR of 1B.2. It is not covered by the Central Coastal NCCP/HCP. It typically blooms between April and June (Jepson Flora Project 2020; CNPS 2020). This perennial herb occurs on heavy, often clayey soils or grassy slopes in chaparral, coastal scrub, valley and foothill grassland at elevations between approximately 5 and 2,975 feet above msl (Roberts 2008; Jepson Flora Project 2020). This species is known from the South Coast (Jepson Flora Project 2020).

Approximately 810 many-stemmed dudleya individuals were observed in 2 locations in the survey area (Exhibit 5). Approximately 800 individuals were observed in the eastern portion of the survey area and 10 individuals were observed on a steep, east-facing cliff in the western portion of the survey area. The majority of individuals (eastern location) were observed in disturbed sagebrush scrub with Ceineba-rock outcrop complex and pits soil. The smaller population (western location) was observed in toyon-sumac chaparral with Sorrento loam soil. The species associated with the many-stemmed dudleya in the survey area included California sagebrush, California buckwheat (*Eriogonum fasciculatum*), daggerleaf cottonrose (*Filago gallica*), white sage (*Salvia apiana*), splendid mariposa lily (*Calochortus splendens*), common goldfields (*Lasthenia gracillis*), osmadenia (*Osmadenia tenella*), and little California melica (*Melica imperfecta*). A total of two voucher specimens were collected for this species. A CNDDB form for this species will be submitted online by Ms. Rudalevige and is included in Attachment C.

Coulter's Matilija Poppy

Coulter's matilija poppy has a CRPR of 4.2. It is a Covered species in the Central Coastal NCCP/HCP. It typically blooms between March and July (Jepson Flora Project 2020; CNPS 2020). This perennial rhizomatous herb occurs in chaparral and coastal scrub, often in elevations between sea level and approximately 3,937 feet above msl (Roberts 2008; Jepson Flora Project 2020). This species grows as clones via rhizomes (Clarke et al. 2007; Jepson Flora Project 2020). This species is known from the South Coast, Western Transverse and Peninsular Ranges, and San Jacinto Mountains (Jepson Flora Project 2020).

[1] The NCCP/HCP refers to this species by its former common name – foothill mariposa lily.

Approximately 46 Coulter's matilija poppy clones were observed in 3 populations in the survey area (Exhibit 5). Coulter's matilija poppy clones were observed in the northern and central portions of the survey area. The clones were observed in sagebrush scrub, coast live oak woodland, and toyon-sumac chaparral with Sorrento loam soil. The species associated with the Coulter's matilija poppy in the survey area include laurel sumac (*Melosma laurina*), blue elderberry (*Sambucus nigra*), California sagebrush, grayish shortpod mustard (*Hirschfeldia incana*), chilicothe (*Marah macrocarpa*), black sage (*Salvia melifera*), California buckwheat, coast live oak (*Quercus agrifolia*), long-flowered monkey flower (*Diplicus longiflorus*), and slender wild oat (*Avena barbata*). A voucher specimen was not collected and a CNDDB form will not be submitted because this species is a lower status species that is not tracked by the CNDDB (i.e., has a CRPR of 4.2).

CONCLUSIONS

The project is early in the preliminary design phase. Final project design will determine whether any special status plant populations will be impacted. Any impacts to intermediate mariposa lily (because there was only one individual) and Coulter's matilija poppy would be covered by the NCCP/HCP. Impacts to many-stemmed dudleya would require mitigation as this species is considered Threatened and Endangered in the project region (i.e., CRPR 1B.2). Impacts will be analyzed and mitigation will be determined in the Biological Technical Report for the project.

Although reference populations and regional rainfall amounts were monitored to ensure the scientific adequacy of these focused surveys, there is always a minimal potential for false negative survey results as species could possibly be present on a site but may not be detectable at the time of the surveys.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Allison Rudalevige (Allison.Rudalevige@psomas.com).

Sincerely,
PSOMAS

PLANT COMPENDIUM

PLANTS OBSERVED IN THE SURVEY AREA DURING SPECIAL STATUS PLANT SURVEYS

Species		Special Status
Scientific Name	**Common Name**	
FERNS		
POLYPODIACEAE – POLYPODY FAMILY		
Polypodium californicum	California polypody	
PTERIDACEAE – BRAKE FAMILY		
Pellaea andromedifolia	coffee fern	
Pentagramma triangularis	goldback fern	
EUDICOTS		
ADOXACEAE – MUSKROOT FAMILY		
Sambucus nigra ssp. caerulea	blue elderberry	
AIZOACEAE – FIG–MARIGOLD FAMILY		
*Carpobrotus edulis**	freeway iceplant	
AMARANTHACEAE – AMARANTH FAMILY		
*Amaranthus albus**	tumbleweed	
ANACARDIACEAE – SUMAC FAMILY		
Malosma laurina	laurel sumac	
Rhus integrifolia	lemonade berry	
*Schinus molle**	pepper tree	
Toxicodendron diversilobum	western poison oak	
APIACEAE – CARROT FAMILY		
Daucus pusillus	small daucus	
*Foeniculum vulgare**	fennel	
ASTERACEAE – SUNFLOWER FAMILY		
Acourtia microcephala	small-headed acourtia	
Ambrosia psilostachya	western ragweed	
Artemisia californica	California sagebrush	
Baccharis pilularis ssp. consanguinea	coyote brush	
Baccharis salicifolia ssp. salicifolia	mule fat	
Brickellia californica	California brickellbush	
*Carduus pycnocephalus ssp. pycnocephalus**	Italian thistle	
*Centaurea melitensis**	tocalote	
Chaenactis glabriuscula	yellow pincushion	
*Cirsium vulgare**	bull thistle	
Corethrogyne filaginifolia	filago-leaved sand-aster	
*Cotula australis**	Australian cotula	
*Cynara cardunculus ssp. cardunculus**	artichoke	
Deinandra fasciculata	fascicled tarplant	
Encelia californica	California encelia	
Erigeron canadensis	horseweed	
Erigeron foliosus	leafy fleabane	
*Gazania linearis**	parallel-sided treasure flower	
Grindelia camporum	field gumplant	
*Hedypnois rhagadioloides**	Crete weed	

PLANTS OBSERVED IN THE SURVEY AREA DURING SPECIAL STATUS PLANT SURVEYS

Species		Special Status
Scientific Name	**Common Name**	
*Helminthotheca echioides**	bristly ox-tongue	
Heterotheca grandiflora	telegraph weed	
Heterotheca sessiliflora ssp. echioides	viper's sessileflower goldenaster	
*Hypochaeris glabra**	smooth cat's-ear	
Isocoma menziesii	coastal goldenbush	
*Lactuca serriola**	prickly lettuce	
Lasthenia gracilis	common goldfields	
Lepidospartum squamatum	scaly scale-broom	
Logfia filaginoides	California cottonrose	
*Logfia gallica**	daggerleaf cottonrose	
Madia exigua	small tarweed	
Osmadenia tenella	osmadenia	
Pseudognaphalium biolettii	Bioletti's cudweed	
Pseudognaphalium californicum	California cudweed	
*Pseudognaphalium luteoalbum**	white lamb cudweed	
Pseudognaphalium stramineum	straw-colored cudweed	
*Pulicaria paludosa**	marsh pulicaria	
Rafinesquia californica	California chicory	
*Senecio vulgaris**	common groundsel	
*Silybum marianum**	milk thistle	
*Sonchus asper ssp. asper**	prickly sow thistle	
*Sonchus oleraceus**	common sow thistle	
Uropappus lindleyi	Lindley's silverpuffs	
Xanthium strumarium	cocklebur	
BETULACEAE – BIRCH FAMILY		
Alnus rhombifolia	white alder	
BORAGINACEAE – BORAGE FAMILY		
Amsinckia intermedia	common fiddleneck	
Amsinckia menziesii	common fiddleneck	
Cryptantha sp.	cryptantha	
Eriodictyon crassifolium var. crassifolium	thick-leaved yerba santa	
Eucrypta chrysanthemifolia	chrysanthemum-leaved eucrypta	
Heliotropium curassavicum var. oculatum	seaside heliotrope	
Pectocarya linearis ssp. ferocula	narrow-toothed pectocarya	
Phacelia cicutaria	cicuta-leaved phacelia	
Phacelia parryi	Parry's phacelia	
Pholistoma auritum var. auritum	fiesta flower	
Plagiobothrys canescens	valley popcornflower	
BRASSICACEAE – MUSTARD FAMILY		
*Brassica nigra**	black mustard	
*Hirschfeldia incana**	grayish shortpod mustard	
*Lepidium latifolium**	perennial pepperweed	

PLANTS OBSERVED IN THE SURVEY AREA DURING SPECIAL STATUS PLANT SURVEYS

Species		Special Status
Scientific Name	**Common Name**	
*Sisymbrium irio**	London rocket	
CACTACEAE – CACTUS FAMILY		
Opuntia littoralis	seaside prickly-pear	
Opuntia ×vaseyi	Vasey's prickly-pear	
CARYOPHYLLACEAE – PINK FAMILY		
*Silene gallica**	small-flower catchfly	
Silene laciniata	torn catchfly	
*Stellaria media**	common chickweed	
CHENOPODIACEAE – GOOSEFOOT FAMILY		
Chenopodium californicum	California goosefoot	
*Salsola tragus**	Russian thistle	
CONVOLVULACEAE – MORNING–GLORY FAMILY		
Calystegia macrostegia	large-bracted morning-glory	
Cuscuta californica	chaparral dodder	
CRASSULACEAE – STONECROP FAMILY		
Crassula connata	pygmy-weed	
Dudleya lanceolata	lance-leaved dudleya	
Dudleya multicaulis	many-stemmed dudleya	CRPR 1B.2
Dudleya pulverulenta	chalk dudleya	
CUCURBITACEAE – GOURD FAMILY		
Cucurbita foetidissima	buffalo gourd	
Marah macrocarpa	chilicothe	
EUPHORBIACEAE – SPURGE FAMILY		
Croton californicus	California croton	
Croton setiger	turkey-mullein	
Euphorbia albomarginata	rattlesnake sandmat	
*Euphorbia peplus**	petty spurge	
*Ricinus communis**	common castor bean	
FABACEAE – LEGUME FAMILY		
Acmispon glaber	deerweed	
Acmispon micranthus	small-flowered deervetch	
Lupinus bicolor	miniature lupine	
Lupinus sparsiflorus	Coulter's lupine	
*Medicago polymorpha**	variable burclover	
*Melilotus indicus**	sourclover	
Trifolium willdenovii	tomcat clover	
FAGACEAE – OAK FAMILY		
Quercus agrifolia	coast live oak	
GERANIACEAE – GERANIUM FAMILY		
*Erodium botrys**	long-beaked filaree	
*Erodium cicutarium**	redstem filaree

Subject: Results of Special Status Plant Surveys for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Welch:

This Letter Report presents the results of focused surveys for special status plant species for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "project site") located in Orange County, California. The purpose of the surveys was to determine the presence or absence of special status plant species upstream of Santiago Dam. Focused surveys for special status plants were conducted downstream of Santiago Dam in spring/summer 2020 (Psomas 2020).

PROJECT LOCATON AND DESCRIPTION

The project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). The Biological Study Area includes Santiago Creek Dam, downstream areas along Santiago Creek, areas around Irvine Lake, and upstream areas along Santiago Creek. The Biological Study Area is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

The Biological Study Area is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the Biological Study Area in the northwest, downstream of the Dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the Biological Study Area. Elevations in the Biological Study Area range from approximately 657 to 996 feet above mean sea level (msl).

The Biological Study Area is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Dam and its associated structures are located within designated "Non-Reserve Open Space", while

Fax 714.545.8883
www.Psomas.com

Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD)[1] is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The IRWD and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Division of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the design phase. Staging areas are currently planned to be placed in disturbed areas on the east side of Irvine Lake, adjacent to where Santiago Creek flows into the lake.

EXISTING CONDITIONS

The special status plant survey area included all project impact areas (i.e., permanent, temporary, and additional inundation areas) plus a 50-foot buffer. A variety of vegetation types occur in the survey area, including sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, and vegetated fluctuating shoreline (Exhibit 3). Other landcover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

Soils mapped in the survey area include Alo variant clay, Anaheim loam, Anaheim clay loam, beaches, Bosanko clay, Botella clay loam, Capistrano sandy loam, Cieneba sandy loam, Cieneba–rock outcrop complex, Corralitos loamy sand, Myford sandy loam, riverwash, rock outcrop–Cieneba complex, Soboba gravelly loamy sand, Soper loam, Soper gravelly loam, Soper cobbly loam, and Sorrento loam (Exhibit 4).

SURVEY METHODS

Botanical surveys were floristic in nature and consistent with the protocols created by the California Department of Fish and Wildlife (CDFW; CDFW 2018). Prior to the 2022 field surveys, a literature search was conducted to identify special status plant species reported from the vicinity of the project site. Sources reviewed include the USGS Black Star Canyon, Orange, Tustin, and El Toro 7.5-minute quadrangles in the California Native Plant Society's Inventory of Rare and Endangered Plants (CNPS 2022) and the CDFW's California Natural Diversity Database (CNDDB) (CDFW 2022a).

Rainfall received in the winter and spring determines the germination of many annual and perennial herb species. The region received approximately 9.3 inches of precipitation between July 2021 and June 2022 (data taken from Irvine – South Coast Valleys Station No. 75) (CIMIS 2022). The average annual precipitation for this area is between 10 and 13 inches.

[1] The Santiago County Water District (SCWD) was also a participating jurisdiction in the NCCP/HCP. The SCWD consolidated with IRWD in 2006.

Reference populations were monitored for annual and difficult-to-detect target species to ensure that the surveys were comprehensive (Table 1). This is especially relevant during periods of unusual rainfall patterns or below average rainfall. If conditions at a nearby reference population are suitable for germination and growth, then it can be inferred that conditions would also be suitable on the survey area. Reference populations were not monitored for species with a California Rare Plant Rank (CRPR) of 3 or 4, large perennials (e.g., Tecate cypress [*Hesperocyparis forbesii*] and chaparral nolina [*Nolina cismontana*]) which would be identifiable throughout the year, or for species lacking a publicly accessible reference population.

TABLE 1
REFERENCE POPULATIONS MONITORED IN THE PROJECT REGION

Species	Date Observed	Location	Phenology
Calochortus weedii var. *intermedius* intermediate mariposa lily	May 12, 2022	Santiago Canyon vicinity	early bloom
Dudleya multicaulis many-stemmed dudleya	April 27, 2022	Santiago Canyon vicinity	in bloom
Pseudognaphalium leucocephalum white rabbit-tobacco	September 8, 2022	San Juan Capistrano	in bloom

Surveys were conducted on March 24, 2022, by Psomas Senior Biologist Allison Rudalevige; on April 25, 26, and 28, 2022, by Ms. Rudalevige and Consulting Botanist Sandra Leatherman; on May 23 and 26 by Ms. Rudalevige and Psomas Biologist Erin Ruckman; and on September 13, 2022, by Ms. Rudalevige and Psomas Biologist Sarah Thomas. The total number of person-hours spent surveying was approximately 87.75 hours. The special status plant survey area included all project impact areas (i.e., permanent, temporary, and additional inundation areas) plus a 50-foot buffer. A systematic survey was conducted in all areas of suitable special status plant habitat in the survey area. Inaccessible areas (e.g., steep cliffs), were observed remotely with binoculars. All plant species observed were recorded in field notes. Plant species were identified in the field or collected for future identification. Plants were identified to the taxonomic level necessary to determine whether they were a special status species. Plants were identified using taxonomic keys, descriptions, and illustrations in Jepson Flora Project (2022), Baldwin et al. (2012), and Hickman (1993). Nomenclature of plant taxa conform to the *Special Vascular Plants, Bryophytes, and Lichens List* (CDFW 2022b) for special status species and the Jepson eFlora (Jepson Flora Project 2022) for all other taxa.

Any special status plant species observed in the survey area were mapped on an iPad loaded with Avenza Maps software or with a handheld Garmin Global Positioning System (GPS) unit. Data were collected on the number and phenology of individuals (estimated for large populations) and microsite characteristics (e.g., slope, aspect, soil texture, surrounding habitat, and associated species). Representative photographs are included as Attachment A.

SURVEY RESULTS

Table 2 identifies the special status plants reported from the literature review with their status, their potential to occur in the survey area, and the survey results. Braunton's milkvetch (*Astragalus brauntonii*), intermediate mariposa lily (*Calochortus weedii* var. *intermedius*), mud nama (*Nama stenocarpa*), and Coulter's matilija poppy (*Romneya coulteri*) were observed during the surveys and are discussed further below. A list of all plants observed in the survey area during 2022 special status plant surveys is included in Attachment B.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
chaparral sand-verbena *Abronia villosa* var. *aurita*	—	—	1B.1	Sandy areas in chaparral, coastal scrub, desert dunes. Blooms: (January) March – September.	Not expected to occur because not observed during focused surveys; suitable habitat.
Yucaipa onion *Allium marvinii*	—	—	1B.2	Dry slopes and ridges in chaparral. Blooms: April – May.	Not expected to occur; outside current known range.
Braunton's milk-vetch *Astragalus brauntonii*	FE	—	1B.1	Recent burns or disturbed areas, usually on sandstone with carbonate layers in chaparral, coastal scrub, valley and foothill grassland. Reported immediately north of the survey area in 2012 (CDFW 2022a). Blooms: January – August.	**Observed in the survey area.**
Coulter's saltbush *Atriplex coulteri*	—	—	1B.2	Alkaline or clay soils in coastal bluff scrub, coastal dunes, coastal scrub, and valley and foothill grassland. Blooms: March – October.	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
south coast saltscale *Atriplex pacifica*	—	—	1B.2	Alkaline soils in coastal scrub, coastal bluff scrub, playas, coastal dunes. Blooms: March – October.	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
Davidson's saltscale *Atriplex serenana* var. *davidsonii*	—	—	1B.2	Alkaline soils in coastal bluff scrub, coastal scrub. Blooms: April – October.	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
Malibu baccharis *Baccharis malibuensis*	—	—	1B.1	In Conejo volcanic substrates in coastal scrub, chaparral, cismontane woodland, and riparian woodland. Reported northeast of the survey area in 2000 (CCH 2022). Blooms: August.	Not expected to occur because not observed during focused surveys; suitable habitat.
thread-leaved brodiaea *Brodiaea filifolia*	FT	SE	1B.1	Chaparral openings, cismontane woodland, coastal scrub, playas, valley and foothill grassland, vernal pools. Blooms: March – June.	Not expected to occur because not observed during focused surveys; suitable habitat.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
Brewer's calandrinia *Calandrinia breweri*	—	—	4.2	Sandy or loamy soils in disturbed sites and burns in chaparral and coastal sage scrub. Blooms: (January) March – June.	Not expected to occur because not observed during focused surveys; suitable habitat.
Catalina mariposa lily *Calochortus catalinae*	—	—	4.2	Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland. Blooms: (February) March – June.	Not expected to occur because not observed during focused surveys; suitable habitat. Incidentally observed on access road outside survey area.
Plummer's mariposa-lily *Calochortus plummerae*	—	—	4.2	Rocky and sandy sites, usually of granitic or alluvial material, in coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, lower montane coniferous forest. Blooms: May – July.	Not expected to occur because not observed during focused surveys; suitable habitat.
intermediate mariposa-lily *Calochortus weedii* var. *intermedius*	—	—	1B.2	Dry, rocky calcareous slopes and rock outcrops in coastal scrub, chaparral, valley and foothill grassland. Blooms: May – July.	**Observed in the survey area.**
Lewis' evening-primrose *Camissoniopsis lewisii*	—	—	3	Sand or clay substrate in coastal bluff scrub, cismontane woodland, coastal dunes, coastal scrub, valley and foothill grassland. Blooms: March – May (June).	Not expected to occur because not observed during focused surveys; suitable habitat.
southern tarplant *Centromadia parryi* ssp. *australis*	—	—	1B.1	Disturbed sites and alkaline soils in marshes and swamp margins, valley and foothill grassland, and vernal pools. Blooms: May – November.	Not expected to occur because not observed during focused surveys; suitable habitat.
San Fernando Valley spineflower *Chorizanthe parryi* var. *fernandina*	—	SE	1B.1	Sandy soils in coastal scrub, valley and foothill grasslands. Blooms: April – July.	Not expected to occur; historic (1902) occurrence within 0.5 mile but outside the current known range of the species (CDFW 2022a).
long-spined spineflower	—	—	1B.2	Gabbroic clay or sandy soil in chaparral, coastal scrub, meadows and	Not expected to occur because not observed during focused surveys;

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
Chorizanthe polygonoides var. *longispina*				seeps, valley and foothill grassland, vernal pools. Blooms: April – July.	suitable habitat but at edge of current known range.
small-flowered morning-glory *Convolvulus simulans*	—	—	4.2	Clay, occasionally serpentine soils in chaparral openings, coastal scrub, valley and foothill grasslands. Reported just west of Irvine Lake in 2016 (CCH 2022). Blooms: March – July.	Not expected to occur because not observed during focused surveys; suitable habitat.
paniculate tarplant *Deinandra paniculata*	—	—	4.2	Usually vernally mesic, sometimes sandy substrate in coastal scrub, valley and foothill grassland, and vernal pools. Blooms: (March) April – November.	Not expected to occur because not observed during focused surveys; suitable habitat.
Cleveland's bush monkeyflower *Diplacus clevelandii*	—	—	4.2	Disturbed areas and open borders of chaparral, cismontane woodland, and lower montane coniferous forest. Blooms: April – July.	Not expected to occur; outside current known elevational range.
slender-horned spineflower *Dodecahema leptoceras*	FE	SE	1B.1	Sandy soil in chaparral, cismontane woodland, and alluvial fan coastal scrub. Blooms: April – June.	Not expected to occur; outside current known range.
Santa Monica Mountains dudleya *Dudleya cymosa* ssp. *ovatifolia*	FT	—	1B.1	Volcanic or sedimentary, rocky sediment in chaparral and coastal scrub. Blooms: March – June.	Not expected to occur because not observed during focused surveys; suitable habitat.
many-stemmed dudleya *Dudleya multicaulis*	—	—	1B.2	Heavy, often clayey soils or grassy slopes in chaparral, coastal scrub, valley and foothill grassland. Blooms: April – July.	Not expected to occur because not observed during focused surveys; suitable habitat. Known to occur just outside the survey area; observed during previous focused surveys downstream of the dam.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
Santa Ana River woollystar *Eriastrum densifolium* ssp. *sanctorum*	FE	SE	1B.1	Sandy soils on river floodplains or terraced fluvial deposits in coastal scrub and chaparral. Blooms: April – September.	Not expected to occur; outside current known range (i.e., the Santa Ana River watershed).
Palmer's grapplinghook *Harpagonella palmeri*	—	—	4.2	Clay soils in open grasses areas in chaparral, coastal scrub, and valley and foothill grassland. Blooms: March – May.	Not expected to occur because not observed during focused surveys; suitable habitat.
Los Angeles sunflower *Helianthus nuttallii* ssp. *parishii*	—	—	1A	Coastal and freshwater marshes and swamps. Blooms: August – October.	Not expected to occur because not observed during focused surveys and because species is presumed extinct; suitable habitat.
Tecate cypress *Hesperocyparis forbesii*	—	—	1B.1	Clay or gabbro soils in closed-cone coniferous forest and chaparral. Perennial species observable year-round.	Not expected to occur; no suitable habitat.
Gowen cypress *Hesperocyparis goveniana*	FT	—	1B.2	Closed-cone coniferous forest, mixed evergreen forest, chaparral, and coastal terraces. Perennial species observable year-round.	Not expected to occur; outside current known range; no suitable habitat.
vernal barley *Hordeum intercedens*	—	—	3.2	Coastal dunes, coastal scrub, saline flats and depressions of valley and foothill grassland, vernal pools. Reported just south of Irvine Lake in 1998 (CCH 2020). Blooms: March – June.	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
mesa horkelia *Horkelia cuneata* var. *puberula*	—	—	1B.1	Sandy or gravelly soils in chaparral, cismontane woodland, and coastal scrub. Blooms: February – July (September).	Not expected to occur because not observed during focused surveys; suitable habitat.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
Southern California black walnut *Juglans californica*	—	—	4.2	Chaparral, cismontane woodland, coastal scrub, and riparian woodland. Perennial species observable year-round. Blooms: March – August.	Not expected to occur because not observed during focused surveys.
southwestern spiny rush *Juncus acutus* ssp. *leopoldii*	—	—	4.2	Moist, saline places including coastal dunes, marshes and swamps, and meadows and seeps. Perennial species observable year-round. Blooms: (March) May – June.	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
Coulter's goldfields *Lasthenia glabrata* ssp. *coulteri*	—	—	1B.1	Usually alkaline soils in coastal salt marsh, playas, vernal pools. Blooms: February – June.	Not expected to occur because not observed during focused surveys; no suitable habitat.
heart-leaved pitcher sage *Lepechinia cardiophylla*	—	—	1B.2	Closed-cone coniferous forest, chaparral, cismontane woodland. Blooms: April – July.	Not expected to occur; outside the current known elevational range; no suitable habitat.
Robinson's pepper-grass *Lepidium virginicum* var. *robinsonii*	—	—	4.3	Dry soils in chaparral and coastal scrub. Blooms: January – July.	Not expected to occur because not observed during focused surveys; suitable habitat.
Ocellated Humboldt lily *Lilium humboldtii* ssp. *ocellatum*	—	—	4.2	Openings in chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and riparian woodland. Blooms: March – July (August).	Not expected to occur because not observed during focused surveys; suitable habitat.
California box-thorn *Lycium californicum*	—	—	4.2	Coastal bluff scrub and coastal scrub. Perennial species observable year-round. Blooms: March – August (December).	Not expected to occur; outside current known range.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
intermediate monardella *Monardella hypoleuca* ssp. *intermedia*	—	—	1B.3	Chaparral, cismontane woodland, and sometimes lower montane coniferous forest. Blooms: April – September.	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
mud nama *Nama stenocarpa*	—	—	2B.2	Lake shores, riverbanks, intermittently wet areas, marshes, and swamps. Blooms: January – July.	**Observed in the survey area.**
Gambel's water cress *Nasturtium gambelii*	FE	ST	1B.1	Freshwater and brackish marshes at the margins of lakes and along streams; in or just above the water level. Blooms: April – October.	Not expected to occur because not observed during focused surveys; suitable habitat.
chaparral nolina *Nolina cismontana*	—	—	1B.2	Primarily sandstone and shale substrates in chaparral and coastal scrub. Perennial species observable year-round. Blooms: (March) May – July.	Not expected to occur because not observed during focused surveys; suitable habitat.
California beardtongue *Penstemon californicus*	—	—	1B.2	Sandy or granitic soils and stony slopes in chaparral, lower montane coniferous forest, pinyon and juniper woodland. Blooms: May – June (August).	Not expected to occur; outside current known range; no suitable habitat.
Allen's pentachaeta *Pentachaeta aurea* ssp. *allenii*	—	—	1B.1	Openings in coastal scrub and valley and foothill grasslands. Blooms: March – June.	Not expected to occur because not observed during focused surveys; suitable habitat.
Hubby's phacelia *Phacelia hubbyi*	—	—	4.2	Open gravelly or rocky slopes of chaparral, coastal scrub, and valley and foothill grassland. Blooms: April – July.	Not expected to occur because not observed during focused surveys; suitable habitat.
woolly chaparral-pea *Pickeringia montana* var. *tomentosa*	—	—	4.3	Gabbroic, granitic, or clay soil in chaparral. Blooms: May – August.	Not expected to occur; no suitable habitat.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
Fish's milkwort *Polygala cornuta* var. *fishiae*	—	—	4.3	Chaparral, cismontane woodland, riparian woodland. Blooms: May – August.	Not expected to occur because not observed during focused surveys; suitable habitat.
white rabbit-tobacco *Pseudognaphalium leucocephalum*	—	—	2B.2	Sandy, gravelly areas of riparian woodland, cismontane woodland, coastal scrub, and chaparral. Blooms: (July) August – November (December).	Not expected to occur because not observed during focused surveys; suitable habitat.
Coulter's matilija poppy *Romneya coulteri*	—	—	4.2	Chaparral and coastal scrub, often in burns. Blooms: March – July (August).	**Observed in the survey area.**
chaparral ragwort *Senecio aphanactis*	—	—	2B.2	Drying alkaline flats of chaparral, cismontane woodland, coastal scrub. Blooms: January – April (May).	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
salt spring checkerbloom *Sidalcea neomexicana*	—	—	2B.2	Alkali springs and marshes in playas, chaparral, coastal scrub, lower montane coniferous forest, and Mojavean desert scrub. Blooms: March – June.	Not expected to occur because not observed during focused surveys; marginally suitable habitat.
estuary seablite *Suaeda esteroa*	—	—	1B.2	Coastal salt marshes in clay, silt, and sand substrates. Blooms: (January – May) July – October.	Not expected to occur; no suitable habitat.
woolly seablite *Suaeda taxifolia*	—	—	4.2	Coastal bluff scrub, coastal dunes, and salt marshes. Blooms: January – December.	Not expected to occur; outside current known range; no suitable habitat.

TABLE 2
SPECIAL STATUS PLANT SPECIES REPORTED
FROM THE SURVEY AREA VICINITY

Species	Federal Status	State Status	CRPR	Habitat*	Potential to Occur in the Survey Area; Results of the Surveys
San Bernardino aster *Symphyotrichum defoliatum*	—	—	1B.2	Disturbed areas, vernally mesic grassland, or near ditches, streams, and springs in meadows and seeps, cismontane woodland, coastal scrub, lower montane coniferous forest, marshes and swamps, valley and foothill grassland. Blooms: July – November.	Not expected to occur because not observed during focused surveys; suitable habitat.
San Diego County viguiera *Viguiera laciniata*	—	—	4.3	Chaparral and coastal scrub. Blooms: February – June (August).	Not expected to occur because not observed during focused surveys; suitable habitat.

CRPR: California Rare Plant Rank

LEGEND:

Federal Status		**State Status**	
FE	Endangered	SE	Endangered
FT	Threatened	ST	Threatened

CRPR

1A	Plants presumed extirpated in California and either rare or extinct elsewhere
1B	Plants Rare, Threatened, or Endangered in California and elsewhere
2B	Plants Rare, Threatened, or Endangered in California but more common elsewhere
3	Plants about which we need more information – A Review List
4	Plants of limited distribution – A Watch List

CRPR Threat Code Extensions

None	Plants lacking any threat information
.1	Seriously threatened in California (over 80% of occurrences threatened; high degree and immediacy of threat)
.2	Fairly threatened in California (20–80% of occurrences threatened; moderate degree and immediacy of threat)
.3	Not very threatened in California (<20% of occurrences threatened; low degree and immediacy of threat or no current threats known)

Species that were observed on site are shown in **boldface type.** For blooming period, months included in parentheses are uncommon.

* Sources include CDFW 2022a, CNPS 2022, and Jepson Flora Project 2022.

Braunton's Milkvetch

Braunton's milkvetch is a federally listed Endangered species and has a CRPR of 1B.1. It is not a Covered species in the Central Coastal NCCP/HCP. It typically blooms between January and August (CNPS 2022). This perennial herb occurs in chaparral, coastal scrub, and valley and foothill grassland at elevations between approximately 15 and 2,100 feet above msl (Jepson Flora Project 2022; CNPS 2022). It generally occurs after recent burns or in disturbed areas, usually in sandstone with carbonate layers (CNPS 2022). This species is known from the western portion of the Western Transverse Ranges, the San Gabriel Mountains, tentatively from the San Gabriel Mountains/South Coast, and the northern Peninsular Ranges (Jepson Flora Project 2022); it is known from a few canyons in Orange County (Allen and Roberts 2013).

One individual Braunton's milkvetch was observed in the survey area (Exhibit 5). It was observed in the sandy channel of Santiago Creek, upstream of the lake. The species associated with the Braunton's milkvetch observed in the survey area include mule fat, cicuta-leaved phacelia (*Phacelia cicutaria*), and horseweed (*Erigeron canadensis*). A voucher specimen was not collected due to the limited population size (i.e., a single, small individual). A CNDDB form for this species will be submitted online by Ms. Rudalevige and is included in Attachment C.

Intermediate Mariposa Lily

Intermediate mariposa lily has a CRPR of 1B.2. It is a Conditionally Covered species[2] in the Central Coastal NCCP/HCP (i.e., populations less than 20 individuals are fully authorized). It typically blooms between May and July (Jepson Flora Project 2022; CNPS 2022). This perennial bulbiferous herb occurs on dry, rocky, open slopes in chaparral and coastal sage scrub at elevations between sea level and approximately 2,231 feet above msl (Roberts 2008; Jepson Flora Project 2022). It is sometimes locally common following fire (Roberts 2008). This species is known from the South Coast and northern Peninsular Ranges (Jepson Flora Project 2022).

Four individual intermediate mariposa lilies were observed in the survey area and an additional individual was observed just outside the survey area (Exhibit 5). The four individuals were observed in two populations in the northwestern portion of the survey area on moderately steep, southeast- to east-facing slopes in sagebrush scrub. The species associated with the intermediate mariposa lilies observed in the survey area include California sagebrush (*Artemisia californica*), black sage (*Salvia mellifera*), chilicothe (*Marah macrocarpa*), mule fat (*Baccharis salicifolia* ssp. *salicifolia*), California encelia (*Encelia californica*), and smilo grass (*Stipa miliacea* var. *miliacea*). A voucher specimen was not collected due to the limited population size. A CNDDB form for this species will be submitted online by Ms. Rudalevige and is included in Attachment C.

Mud Nama

Mud nama has a CRPR of 2B.2. It is not a Covered species in the Central Coastal NCCP/HCP. It typically blooms between January and October (Jepson Flora Project 2022; CNPS 2022). This generally annual herb occurs in intermittently wet areas of marshes and swamps, including lake margins and riverbanks at elevations between approximately 15 and 1,640 feet above msl (Jepson Flora Project 2022; CNPS 2022). This species is known from the San Joaquin Valley, South Coast, southern Channel Islands, western Peninsular Ranges, and southeastern Sonoran Desert (Jepson Flora Project 2022).

Multiple populations were observed in the southern portion of Irvine Lake (Exhibit 5). This area experiences periodic inundation and was mapped as open water during the 2020 vegetation mapping

[2] The NCCP/HCP refers to this species by its former common name – foothill mariposa lily.

upstream of the dam. At the time of the special status plant survey, the substrate was exposed and consisted of riparian herb vegetation; the species was growing in more open areas, including along disturbed roads/trails. The species associated with the mud nama observed in the survey area were primarily rabbitfoot grass (*Polypogon monspeliensis*), white sweetclover (*Melilotus albus*), and sourclover (*Melilotus indicus*) with scattered saltcedar (*Tamarix ramosissima*), alkali heliotrope (*Heliotropium curassavicum* var. *oculatum*), mule fat, flatsedge (*Cyperus* sp.), everlasting (*Pseudognaphalium* sp.), water cress (*Nasturtium officinale*), and willow weed (*Persicaria lapathifolia*). Approximately 98 percent of the populations were vegetative, and 2 percent were flowering.

Individuals covered a large area and the species is small in stature. To estimate the population sizes, ten quadrats one-square-foot in size were sampled in a relatively dense population of mud nama (i.e., Population 1). This resulted in an average of 37.7 individuals per square foot. Therefore, a "high density" population was considered to have between 35 and 40 individuals per square foot. A "moderate density" population was considered to have between 20 and 25 individuals per square foot and a "low density" population was considered to have between 5 and 10 individuals per square foot. Based on these approximate population densities, the total number of individuals in the survey area was estimated using the square footage of each population. The total population was estimated to be between 3.5 and 5.5 million. Information on individual mud nama populations is provided in Table 3. A voucher specimen was collected and will be deposited in a herbarium. A CNDDB form for this species will be submitted online by Ms. Rudalevige and is included in Attachment C.

TABLE 3
MUD NAMA POPULATION INFORMATION

Population Number	Estimated Population Density	Population Area (square feet)	Estimated Population Size (Number of Individuals)
1	High density	25,023	875,805 – 1,000,920
2	Moderate density	15,709	314,180 – 392,725
3*	n/a	n/a	100
4*	n/a	n/a	1,000
5	Low density	284,500	1,422,500 – 2,845,000
6	Low density	12,647	63,235 – 126,470
7	Low density	1,121	5,605 – 11,210
8	High density	1,036	36,260 – 41,440
9	Low density	3,053	15,265 – 30,530
10	Low density	9,367	46,835 – 93,670
11	High density	17,305	605,675 – 692,200
12	Low density	8,335	41,675 – 83,350
		Total	**3,428,135 – 5,318,615**

High Density: 35–40 individuals per square foot; Moderate Density: 20–25 individuals per square foot; Low Density: 5–10 individuals per square foot

*Populations 3 and 4 were small and population sizes were estimated directly.

Coulter's Matilija Poppy

Coulter's matilija poppy has a CRPR of 4.2. It is a Covered species in the Central Coastal NCCP/HCP. It typically blooms between March and July (Jepson Flora Project 2020; CNPS 2020). This perennial rhizomatous herb occurs in chaparral and coastal scrub, often in elevations between sea level and

approximately 3,937 feet above msl (Roberts 2008; Jepson Flora Project 2020). This species grows as clones via rhizomes (Clarke et al. 2007; Jepson Flora Project 2020). This species is known from the South Coast, Western Transverse and Peninsular Ranges, and San Jacinto Mountains (Jepson Flora Project 2020).

One individual Coulter's matilija poppy was observed in the survey area (Exhibit 5). It was observed in a sandy/cobbly low terrace of Santiago Creek upstream of the lake. The species associated with the Coulter's matilija poppy observed in the survey area include mule fat, California buckwheat (*Eriogonum fasciculatum*), fennel (*Foeniculum vulgare*), and tocalote (*Centaurea melitensis*). A voucher specimen was not collected due to the limited population size (i.e., a single individual) and because it is known from the vicinity. A CNDDB form was not prepared for the species because it has a CRPR of 4.2.

OTHER OBSERVATIONS

One other special status species was observed in the survey area during the surveys: bald eagle (*Haliaeetus leucocephalus*, State Endangered, California Fully Protected). The bald eagle was observed flying over the survey area on the east side of Irvine Lake; a CNDDB form for bald eagle is attached to the coastal California gnatcatcher report for the project (Psomas 2022).

CONCLUSIONS

Based on the current project impact footprint, no Braunton's milkvetch, intermediate mariposa lily, mud nama, or Coulter's matilija poppy populations would be impacted by the project. The access road is less than 100 feet from mud nama Population 12. Therefore, it is recommended that a qualified botanist survey the impact area for mud nama during each year of construction following dewatering and prior to grading of the access road to flag the boundaries of mud nama population(s) adjacent to this impact area. The botanist will recommend minor re-routing of the access road to avoid impacts on this species to the extent possible. As the current footprint avoids all impacts to mud nama, it is assumed that potential future impacts due to routing of the access road would be entirely avoided or minimal (e.g., clipping the edge of one population, representing impacts to less than five percent of the population onsite).

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Allison Rudalevige (Allison.Rudalevige@psomas.com).

Sincerely,
PSOMAS

PLANT COMPENDIUM

PLANTS OBSERVED IN THE SURVEY AREA DURING 2022 SPECIAL STATUS PLANT SURVEYS

Species	
Scientific Name	**Common Name**
LYCOPHYTES	
SELAGINELLACEAE – SPIKE–MOSS FAMILY	
Selaginella bigelovii	Bigelow's spike-moss
EUDICOTS	
ADOXACEAE – MUSKROOT FAMILY	
Sambucus mexicana	blue elderberry
AMARANTHACEAE – AMARANTH FAMILY	
*Amaranthus albus**	tumbleweed
ANACARDIACEAE – SUMAC FAMILY	
Malosma laurina	laurel sumac
Rhus integrifolia	lemonade berry
Rhus ovata	sugar bush
*Schinus molle**	pepper tree
Toxicodendron diversilobum	western poison oak
APIACEAE – CARROT FAMILY	
*Foeniculum vulgare**	fennel
*Torilis nodosa**	short sock-destroyer
APOCYNACEAE – DOGBANE FAMILY	
Asclepias fascicularis	narrow-leaf milkweed
ARECACEAE – PALM FAMILY	
*Washingtonia robusta**	Mexican fan palm
ASTERACEAE – SUNFLOWER FAMILY	
Acourtia microcephala	small-headed acourtia
Ambrosia acanthicarpa	annual bur-sage
Ambrosia psilostachya	western ragweed
Artemisia californica	California sagebrush
Baccharis pilularis ssp. consanguinea	coyote brush
Baccharis salicifolia ssp. salicifolia	mule fat
Baccharis sarothroides	broom baccharis
Bebbia juncea var. aspera	rough rush-like sweetbush
Brickellia californica	California brickellbush
*Carduus pycnocephalus ssp. pycnocephalus**	Italian thistle
*Centaurea melitensis**	tocalote
Chaenactis artemisiifolia	white pincushion
Cirsium occidentale	cobwebby thistle
*Cirsium vulgare**	bull thistle
*Cotula australis**	Australian cotula
*Cynara cardunculus ssp. cardunculus**	artichoke
Deinandra fasciculata	fascicled tarplant
Eclipta prostrata	false daisy
Encelia californica	California encelia
Encelia farinosa	brittlebush
Ericameria palmeri var. pachylepis	thickbracted goldenbush

PLANTS OBSERVED IN THE SURVEY AREA DURING 2022 SPECIAL STATUS PLANT SURVEYS

Species	
Scientific Name	**Common Name**
*Erigeron bonariensis**	flax-leaved horseweed
Erigeron canadensis	horseweed
Eriophyllum confertiflorum var. confertiflorum	golden-yarrow
Hazardia squarrosa	saw-toothed goldenbush
*Hedypnois rhagadioloides**	Crete weed
Helianthus annuus	annual sunflower
Helianthus gracilentus	slender sunflower
*Helminthotheca echioides**	bristly ox-tongue
Heterotheca grandiflora	telegraph weed
*Hypochaeris glabra**	smooth cat's-ear
Isocoma menziesii	coastal goldenbush
*Lactuca serriola**	prickly lettuce
Logfia filaginoides	California cottonrose
*Logfia gallica**	daggerleaf cottonrose
Madia gracilis	gumweed
Malacothrix saxatilis	rocky malacothrix
*Matricaria discoidea**	pineapple weed
*Oncosiphon piluliferum**	stinknet
Pluchea sericea	arrow-weed
Pseudognaphalium biolettii	Bioletti's everlasting
Pseudognaphalium californicum	California everlasting
Pseudognaphalium canescens	hairy everlasting
*Pseudognaphalium luteoalbum**	white lamb everlasting
Psilocarphus brevissimus var. brevissimus	dwarf woollyheads
*Pulicaria paludosa**	marsh pulicaria
*Senecio vulgaris**	common groundsel
*Silybum marianum**	milk thistle
*Sonchus oleraceus**	common sow thistle
Stephanomeria diegensis	San Diego stephanomeria
Stylocline gnaphaloides	everlasting neststraw
*Taraxacum officinale**	common dandelion
Uropappus lindleyi	Lindley's silverpuffs
Xanthium strumarium	cocklebur
BORAGINACEAE – BORAGE FAMILY	
Amsinckia intermedia	common fiddleneck
Amsinckia menziesii	common fiddleneck
Cryptantha intermedia	intermediate cryptantha
Emmenanthe penduliflora	whispering bells
Eriodictyon crassifolium var. crassifolium	thick-leaved yerba santa
Eucrypta chrysanthemifolia	chrysanthemum-leaved eucrypta
Heliotropium curassavicum var. oculatum	seaside heliotrope
Nama stenocarpa	mud nama
Pectocarya linearis ssp. ferocula	narrow-toothed pectocarya

PLANTS OBSERVED IN THE SURVEY AREA DURING 2022 SPECIAL STATUS PLANT SURVEYS

Species	
Scientific Name	**Common Name**
Phacelia cicutaria	cicuta-leaved phacelia
Phacelia parryi	Parry's phacelia
Pholistoma auritum var. auritum	fiesta flower
BRASSICACEAE – MUSTARD FAMILY	
*Brassica nigra**	black mustard
*Hirschfeldia incana**	grayish shortpod mustard
*Lepidium didymum**	lesser swine grass
Nasturtium officinale	water cress
*Raphanus sativus**	radish
Rorippa sp.	yellow cress
*Sisymbrium irio**	London rocket
*Sisymbrium orientale**	eastern sisymbrium
CACTACEAE – CACTUS FAMILY	
Opuntia littoralis	seaside prickly-pear
Opuntia vaseyi	Vasey's prickly-pear
CARYOPHYLLACEAE – PINK FAMILY	
*Silene gallica**	small-flower catchfly
Silene laciniata	torn catchfly
CHENOPODIACEAE – GOOSEFOOT FAMILY	
*Atriplex semibaccata**	Australian saltbush
*Chenopodium album**	lamb's quarters
*Salsola tragus**	Russian thistle
CONVOLVULACEAE – MORNING–GLORY FAMILY	
Calystegia macrostegia	large-bracted morning-glory
Cuscuta californica	chaparral dodder
CRASSULACEAE – STONECROP FAMILY	
Crassula connata	pygmy-weed
Dudleya lanceolata	lance-leaved dudleya
Dudleya pulverulenta	chalk dudleya
CUCURBITACEAE – GOURD FAMILY	
Cucurbita foetidissima	buffalo gourd
Marah macrocarpa	chilicothe
EUPHORBIACEAE – SPURGE FAMILY	
Croton setiger	turkey-mullein
Euphorbia albomarginata	rattlesnake sandmat
*Ricinus communis**	common castor bean
FABACEAE – LEGUME FAMILY	
Acmispon americanus var. americanus	American deervetch
Acmispon glaber	deerweed
Acmispon maritimus	coastal deervetch
Astragalus brauntonii	Braunton’s milkvetch
Astragalus pomonensis	Pomona milkvetch
*Cytisus multiflorus**	Spanish broom

PLANTS OBSERVED IN THE SURVEY AREA DURING 2022 SPECIAL STATUS PLANT SURVEYS

Species	
Scientific Name	**Common Name**
Lupinus bicolor	miniature lupine
Lupinus hirsutissimus	stinging lupine
Lupinus succulentus	arroyo lupine
Lupinus truncatus	cut leaf lupine
*Medicago polymorpha**	variable burclover
*Melilotus albus**	white sweetclover
*Melilotus indicus**	sourclover
*Robinia pseudoacacia**	black locust
Trifolium willdenovii	tomcat clover
Vicia sp.	vetch
FAGACEAE – OAK FAMILY	
Quercus agrifolia	coast live oak
GERANIACEAE – GERANIUM FAMILY	
*Erodium botrys**	long-beaked filaree
*Erodium cicutarium**	redstem filaree
Geranium carolinianum	Carolina geranium
GROSSULARIACEAE – GOOSEBERRY FAMILY	
Ribes speciosum	fuchsia-flowered gooseberry
LAMIACEAE – MINT FAMILY	
*Marrubium vulgare**	common horehound
Salvia apiana	white sage
Salvia columbariae	chia
Salvia mellifera	black sage
Trichostema lanceolatum	vinegar weed
LOASACEAE – BLAZING STAR FAMILY	
Mentzelia micrantha	small-flowered blazing star
MALVACEAE – MALLOW FAMILY	
Malacothamnus fasciculatus var.	chaparral mallow
*Malva parviflora**	cheeseweed
Malvella leprosa	alkali-mallow
MONTIACEAE – MINER'S–LETTUCE FAMILY	
Claytonia perfoliata	miner's lettuce
MYRSINACEAE – MYRSINE FAMILY	
*Lysimachia arvensis**	scarlet pimpernel
MYRTACEAE – MYRTLE FAMILY	
Eucalyptus sp.*	gum tree
NYCTAGINACEAE – FOUR O'CLOCK FAMILY	
Mirabilis laevis var. crassifolia	wishbone bush
ONAGRACEAE – EVENING PRIMROSE FAMILY	
Camissoniopsis micrantha	small-flowered camissoniopsis
Clarkia purpurea	purple clarkia
Epilobium ciliatum	fringed willowherb
Gayophytum sp.	gayophytum

PLANTS OBSERVED IN THE SURVEY AREA DURING 2022 SPECIAL STATUS PLANT SURVEYS

Species	
Scientific Name	**Common Name**
OROBANCHACEAE – BROOM–RAPE FAMILY	
Castilleja exserta	purple owl's-clover
Cordylanthus rigidus ssp. setiger	bristly rigid bird's-beak
PAEONIACEAE – PEONY FAMILY	
Paeonia californica	California peony
PAPAVERACEAE – POPPY FAMILY	
Eschscholzia californica	California poppy
Romneya coulteri	Coulter's matilija poppy
PHRYMACEAE – LOPSEED FAMILY	
Diplacus australis	southern monkeyflower
Erythranthe cardinalis	scarlet monkeyflower
Erythranthe guttata	common monkeyflower
PINACEAE – PINE FAMILY	
Pinus sp.*	pine
PLANTAGINACEAE – PLANTAIN FAMILY	
Keckiella antirrhinoides	antirrhinum-like bush penstemon
Keckiella cordifolia	heart-leaved bush penstemon
Plantago erecta	erect plantain
*Veronica anagallis-aquatica**	water speedwell
PLATANACEAE – SYCAMORE FAMILY	
Platanus racemosa	western sycamore
POLYGONACEAE – BUCKWHEAT FAMILY	
Eriogonum fasciculatum	California buckwheat
Persicaria lapathifolia	willow weed
*Polygonum aviculare**	knotweed
Pterostegia drymarioides	fairy mist
*Rumex crispus**	curly dock
ROSACEAE – ROSE FAMILY	
Adenostoma fasciculatum	chamise
Heteromeles arbutifolia	toyon
RUBIACEAE – COFFEE FAMILY	
Galium angustifolium ssp. angustifolium	narrow-leaved bedstraw
Galium aparine	goose grass
SALICACEAE – WILLOW FAMILY	
Populus fremontii ssp. fremontii	Fremont cottonwood
Salix exigua	narrow-leaved willow
Salix gooddingii	Goodding's black willow
Salix laevigata	red willow
Salix lasiolepis	arroyo willow
SCROPHULARIACEAE – FIGWORT FAMILY	
Scrophularia californica	California figwort
Verbascum sp.*	mullein

PLANTS OBSERVED IN THE SURVEY AREA DURING 2022 SPECIAL STATUS PLANT SURVEYS

Species	
Scientific Name	**Common Name**
SOLANACEAE – NIGHTSHADE FAMILY	
Datura wrightii	Wright's jimsonweed
*Nicotiana glauca**	tree tobacco
Solanum americanum	American nightshade
Solanum umbelliferum	umbelled nightshade
TAMARICACEAE – TAMARISK FAMILY	
*Tamarix ramosissima**	saltcedar
URTICACEAE – NETTLE FAMILY	
*Urtica urens**	dwarf nettle
VERBENACEAE – VERVAIN FAMILY	
Phyla nodiflora	node-flowered phyla
Verbena bracteata	bracted vervain
Verbena lasiostachys	woolly-flowered vervain
VIOLACEAE – VIOLET FAMILY	
Viola pedunculata	Johnny-jump-up
MONOCOTS	
AGAVACEAE – AGAVE FAMILY	
Chlorogalum sp.	soap plant
Hesperoyucca whipplei	Whipple's chaparral yucca
CYPERACEAE – SEDGE FAMILY	
Cyperus sp.	flatsedge
Eleocharis sp.	spikerush
IRIDACEAE – IRIS FAMILY	
Sisyrinchium bellum	western blue-eyed-grass
JUNCACEAE – RUSH FAMILY	
Juncus bufonius	toad rush
Juncus mexicanus	Mexican rush
Juncus xiphioides	iris-leaved rush
LILIACEAE – LILY FAMILY	
Calochortus splendens	splendid mariposa lily
Calochortus weedii var. intermedius	intermediate mariposa-lily
POACEAE – GRASS FAMILY	
*Arundo donax**	giant reed
*Avena barbata**	slender wild oat
*Avena fatua**	wild oat
Bothriochloa barbinodis	cane bluestem
*Brachypodium distachyon**	two-corn false brome
*Bromus diandrus**	ripgut grass
*Bromus hordeaceus**	soft chess
*Bromus rubens**	red brome
*Cortaderia selloana**	pampas grass
*Crypsis schoenoides**	swamp prickle grass
*Cynodon dactylon**	Bermuda grass

PLANTS OBSERVED IN THE SURVEY AREA DURING 2022 SPECIAL STATUS PLANT SURVEYS

Species	
Scientific Name	**Common Name**
Elymus condensatus	giant wild-rye
*Festuca myuros**	rattail sixweeks grass
*Festuca perennis**	rye grass
*Gastridium phleoides**	nit grass
*Hordeum murinum ssp. leporinum**	hare barley
*Lamarckia aurea**	goldentop
Melica imperfecta	little California melica
*Pennisetum setaceum**	crimson fountain grass
*Polypogon monspeliensis**	annual beard grass
*Polypogon viridis**	water beard grass
*Schismus barbatus**	barbed Mediterranean grass
Stipa lepida	foothill needle grass
*Stipa miliacea var. miliacea**	smilo grass
Stipa pulchra	purple needle grass
THEMIDACEAE – BRODIAEA FAMILY	
Bloomeria crocea	common goldenstar
Dipterostemon capitatus	blue dicks
TYPHACEAE – CATTAIL FAMILY	
Typha sp.	Cattail
* Non-native or invasive species

QUINO CHECKERSPOT SURVEY

May 2, 2022

Stacey Love
Recovery Permit Coordinator
U.S. Fish and Wildlife Service
2177 Salk Avenue, Suite 250
Carlsbad, California 92008

VIA EMAIL
Stacey_Love@fws.gov

Subject: Results of Focused Presence/Absence Surveys for the Quino Checkerspot Butterfly for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love:

This Letter Report presents the results of focused surveys for the Quino checkerspot butterfly (*Euphydras editha quino*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "project site") located in Orange County, California. The purpose of the surveys was to determine the presence or absence of the Quino checkerspot butterfly on or immediately adjacent to the project site. Surveys were conducted by a Biologist who holds the necessary Federal Endangered Species Act survey permit and were completed according to the guidelines established by the U.S. Fish and Wildlife Service (USFWS 2014). Notification of the intent to conduct protocol-level surveys was submitted to the USFWS on February 3, 2022.

PROJECT LOCATON AND DESCRIPTION

The project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

The project site is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the project site in the northwest, downstream of the Dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the project site. Elevations in the project site range from approximately 657 to 996 feet above mean sea level.

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Tel 714.751.7373
Fax 714.545.8883
www.Psomas.com

The project site is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD)[1] is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The IRWD and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Department of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the design phase but would be located within the survey area provided by IRWD.

SURVEY AREA

A variety of vegetation types occur on the project site, including sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, western sycamore, and vegetated fluctuating shoreline. Other landcover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

Focused surveys for the Quino checkerspot butterfly were conducted within all suitable habitat (i.e., sagebrush scrub, disturbed sagebrush scrub, disturbed floodplain sagebrush scrub, annual grassland, ruderal and disturbed areas) including a 50-foot buffer around the tentative impact footprint. All other vegetation types on the project site were excluded from focused surveys (Exhibit 3).

The Quino survey areas contained suitable habitat, open ground, clay soils, host plants, and/or nectar sources. These habitat types were generally dominated by California sagebrush (*Artemisia californica*), leafy California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*), deerweed (*Acmispon glaber*), laurel sumac (*Malosma laurina*), lemonade berry (*Rhus integrifolia*), scaly scale-broom (*Lepidospartum squamatum*), toyon (*Heteromeles arbutifolia*), and California brickellbush (*Brickellia californica*). Openings between shrubs have native herbs, such as erect plantain (*Plantago erecta*), purple owl's-clover (*Castilleja exserta*), and narrow-toothed pectocarya (*Pectocarya linearis* ssp. *ferocula*), as well as non-native fennel (*Foeniculum vulgare*) and non-native grasses (*Avena* sp. and *Bromus* spp.). Concentrations of host plants were mapped (Exhibit 4). Site photographs of representative habitat in the survey area are provided in Attachment A.

[1] The Santiago County Water District (SCWD) was also a participating jurisdiction in the NCCP/HCP. The SCWD consolidated with IRWD in 2006.

BACKGROUND

The Quino checkerspot butterfly is a federally listed Endangered species. This species is known to occur in San Diego and Riverside Counties, as well as Baja California Norte, Mexico. The historic range of this species included much of coastal California south of Ventura County and inland valleys south of the Tehachapi Mountains. The distribution and abundance of the Quino checkerspot butterfly has been dramatically reduced during the past century as a result of agricultural and urban development and other land-use changes in Southern California (USFWS 2003).

According to the Recovery Plan, more than 75 percent of the Quino checkerspot butterfly's historic range has been lost, including more than 90 percent of its coastal mesa and bluff distribution. The Recovery Plan also states that Quino checkerspot butterfly populations appear to have been reduced in number and size by more than 95 percent range-wide, due to direct and indirect human impacts, including habitat loss and fragmentation, infestation of non-native plant species, and disrupted fire regimes (USFWS 2003).

The life cycle of the Quino checkerspot butterfly typically includes one generation of adults per year, with a four- to six-week flight period. The flight season begins from late January to early March and may continue as late as early May, depending on weather conditions (Emmel and Emmel 1973; USFWS 2003). If a sufficient amount of rain falls in late summer or early fall, a rare second generation of Quino checkerspot butterfly may occur in reduced numbers (Mattoni et al. 1997). Females usually mate on the day they emerge from pupae and lay one or two egg clusters per day for most of their adult life. Adults live from 10 to 14 days; however, adult emergence from pupae is staggered, resulting in a 1-to-2-month flight season. As with most brush-footed butterflies, peak emergence for Quino checkerspot butterfly Quino checkerspot butterfly is expected to occur in the second week of the flight season (USFWS 2003).

Eggs deposited by adults hatch in 10 to 14 days. As many as seven larval molts (instars) may occur prior to pupation. During larval development, the host plants age, eventually dry out and become inedible (senescence). At the time of host plant senescence, if larvae are old enough and have accumulated sufficient reserves, they are able to enter diapause, a resting state that enables larvae to maintain a low metabolic rate and survive harsh environmental conditions that could not typically be tolerated. Like many other related butterflies, Quino checkerspot butterfly larvae can live for several years. One mechanism that generates longevity is repeated diapause (Singer and Ehrlich 1979), which occurs when larvae emerge from diapause, feed, and then re-enter diapause, postponing development until the next year. It has been suggested that Quino checkerspot butterfly larvae may also be able to survive without "breaking" diapause to feed in extremely dry years (USFWS 2003). It is unknown whether Quino checkerspot butterfly larvae can store enough energy reserves to prolong diapause without feeding at all for more than a year (USFWS 2003).

The Quino checkerspot butterfly is a member of the brush-footed butterfly family *Nymphalidae*. The dorsal (top) sides of the wings have a red, black, and cream-colored checkered pattern, with a distinctively larger orange subterminal band on the lower hind wings. The ventral (bottom) sides are dominated by a checkered red and cream pattern with heavy black lines separating the colors. The abdomen of the Quino checkerspot butterfly has three red bands, which makes it distinct from the three checkerspot species that could co-occur with the Quino: Chalcedon/Variable checkerspot (*E. chalcedona*) have red bands with white dots; Gabb's checkerspot (*Chlosyne gabbii gabbii*) have orange bands and no dots; and Leanira checkerspots (*Chlosyne leanira*) have cream bands and no dots (USFWS 2003).

The larva (caterpillar of the Quino checkerspot butterfly) can be distinguished after their second molt by the characteristic dark-black coloration and row of eight to nine orange tubercles on their back. Larvae feed on specific plants (host plants), primarily two types of plantain, erect plantain and Patagonian plantain (*Plantago patagonica*) when developing. Secondary host plants that may be utilized when

plantain is not available include Coulter's snapdragon (*Antirrhinum coulterianum*), rigid bird's beak (*Cordlyanthus rigidus*), purple owl's-clover, Chinese houses (*Collinsia* spp.), and possibly related Indian paintbrush (*Castilleja affinis* ssp. *affinis*). The USFWS published a Revised Critical Habitat for Quino checkerspot butterfly on June 17, 2009. The designation covers 62,125 acres of land in San Diego and Riverside Counties (USFWS 2009). The project site is not located in the Revised Critical Habitat for the Quino checkerspot butterfly.

SURVEY METHODOLOGY

All Quino checkerspot butterfly surveys were conducted following guidelines from USFWS Survey Protocol (USFWS 2014) to maximize detection of adults during the flight season. Protocol surveys consist of an initial site assessment to determine if the project site contains areas recommended for Quino checkerspot butterfly surveys. If the project site is determined to be comprised solely of excluded areas (described below), Quino checkerspot butterfly surveys are not recommended. If a project site has areas suitable for butterfly surveys (non-excluded areas), then surveys should be conducted in those portions of the project site. Per USFWS protocol, five weekly focused surveys were conducted beginning the third week of February.

Site Assessment

All areas within 50-feet of the proposed impact footprint (including additional inundation areas) were included in the site assessment. The site assessment was conducted prior to the first focused butterfly survey to identify which portions of the project site provide suitable habitat for Quino checkerspot butterfly. The assessment was conducted by Psomas Senior Biologist Lindsay Messett (USFWS Permit No. TE 067064-5) on February 15 and 16, 2022.

Orchards, developed areas, or small in-fill parcels (plots smaller than one acre that are completely surrounded by urban development) largely dominated by non-native vegetation, active/in-use agricultural fields, closed-canopy forests or riparian areas, dense chaparral, and small openings (less than one acre) completely enclosed within dense chaparral, were considered unsuitable and designated as "excluded areas". Areas outside of excluded areas, regardless of the presence/absence of host plants and nectar sources, were considered potential habitat areas.

Quino Survey Area

All areas that were not excluded were surveyed for Quino checkerspot butterfly, regardless of host plant presence, absence, and/or density. The Quino checkerspot butterfly is generally associated with sage scrub, open chaparral, grasslands, and vernal pools. Within these communities, they are usually observed in open or sparsely vegetated areas (including trails and dirt roads), on hilltops, and on ridgelines. All wildlife species observed were recorded (Attachment B).

Vegetation types in the survey area were previous mapped by Psomas Senior Biologist Allison Rudalevige downstream of the dam in February 2020. Ms. Rudalevige and Ms. Messett mapped vegetation mapping upstream of the dam in September 2020. Nomenclature of vegetation types generally follows that of Gray and Bramlet (1992) but was cross-referenced to A Manual of California Vegetation (CNPS 2020), which is the most current vegetation classification system used by the California Department of Fish and Wildlife (CDFW) for assessing sensitive natural communities (CDFW 2020).

Focused Surveys

The survey area contained approximately 308 acres of suitable habitats that could not be excluded per USFWS protocol (Exhibit 3); two days were required to complete each survey visit. The survey visits were divided into two areas (i.e., upstream of Santiago Dam and downstream of Santiago Dam). Ms. Messett conducted five rounds of focused survey visits in the survey areas during the 2022 flight season. Surveys were conducted once per week (weather permitting) on non-consecutive days during the peak of the flight season on February 18, 19, 25, 27; March 3, 4, 10, 11, 17, and 18, 2022. Table 1 below summarizes the survey conditions during each of the ten surveys.

TABLE 1
SUMMARY OF QUINO CHECKERSPOT BUTTERFLY SURVEYS

Survey Number	Survey Location	Date	Time (Start/End)	Surveyor	Weather Conditions		
					Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)
1	Downstream of Santiago Dam	February 18, 2022	0900/1500	Messett	62/70	0–1/2–5	Clear/Clear
1	Upstream of Santiago Dam	February 19, 2022	0930/1530	Messett	60/70	0–1/4–6	25/20
2	Downstream of Santiago Dam	February 25, 2022	1000/1600	Messett	60/63	2–3/5–7	Clear/Clear
2	Upstream of Santiago Dam	February 27, 2022	1000/1545	Messett	61/70	0–1/5–6	10/10
3	Upstream of Santiago Dam	March 3, 2022	0930/1555	Messett	62/67	1–2/8–10	50/30
3	Downstream of Santiago Dam	March 4, 2022	0915/1530	Messett	63/65	0–1/2–5	50/50
4	Upstream of Santiago Dam	March 10, 2022	0845/1550	Messett	63/71	2–3/4–6	30/Clear
4	Downstream of Santiago Dam	March 11, 2022	0815/1530	Messett	68/74	3–4/6–8	Clear/Clear
5	Upstream of Santiago Dam	March 17, 2022	0930/1600	Messett	65/80	0–1/2–5	25/30
5	Downstream of Santiago Dam	March 18, 2022	0900/1515	Messett	68/74	1–2/4–6	Clear/Clear

Surveys focused on likely breeding areas (host plant patches), feeding areas (nectaring plant patches), and topographical features conducive to detecting the Quino checkerspot butterfly (ridgelines, hilltops, rock outcrops, dirt roads, and open ground with clay soils). Survey areas were walked at an average rate of 10 to 15 acres per hour. Binoculars were used to identify the majority of butterfly species that could not be seen at close range. General survey forms were filled out for each survey, noting weather conditions, survey date, start and end times, and nectaring sources in bloom (Attachment C).

SURVEY RESULTS

Two host plant species: erect plantain and purple owl's-clover were observed in the survey area. Plantain was located throughout the survey area with the most abundant patches located downstream of Santiago Dam (in the northern portion of the survey area) and in the central-southern portion of the survey area, south of Irvine Lake. A few individual purple owl's-clover were observed on the project site in this same general location (Exhibit 4).

Several nectar sources occur throughout the survey area, including valley popcornflower (*Plagiobothrys canescens*), common fiddleneck (*Amsinckia intermedia*) and (*Amsinckia menziesii*), red maids (*Calandrinia menziesii*), blue dicks (*Dipterostemon capitatus*), common goldfields (*Lasthenia gracilis*), western blue-eyed grass (*Sisyrinchium bellum*), and California buckwheat (*Eriogonum fasciculatum*).

Several topographic features (i.e., rock outcrops, dirt roads) known to attract Quino checkerspot butterfly and other butterfly species were present in the survey area.

No Quino checkerspot butterfly larvae or adults were observed during the surveys.

OTHER OBSERVATIONS

Four special status species were observed and/or detected in the survey area during the surveys: bald eagle (*Haliaeetus leucocephalus*, State Endangered, California Fully Protected), American peregrine falcon (*Falco peregrinus anatum*, California Fully Protected), coastal California gnatcatcher (*Polioptila californica californica*, federally Threatened, California Species of Special Concern), and southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*, CDFW Watch List) (Exhibit 4). These species are all tracked by the California Natural Diversity Database (CNDDB). The bald eagles were observed at their nest during a focused survey for coastal California gnatcatcher for the same project; the CNDDB form for bald eagle will be attached to that report (Psomas 2022 [in preparation]). CNDDB forms for the other three species are included in Attachment D and will be submitted online by Ms. Messett.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Lindsay Messett (Lindsay.Messett@psomas.com).

Sincerely,
PSOMAS

WILDLIFE COMPENDIUM

WILDLIFE SPECIES OBSERVED

Species		Special Status
Scientific Name	**Common Name**	
INVERTEBRATES		
PAPILIONIDAE - SWALLOWTAIL BUTTERFLIES		
Papilio eurymedon	pale swallowtail	
Papilio rutulus	western tiger swallowtail	
Papilio zelicaon	anise swallowtail	
PIERIDAE - WHITES, SULFURS AND ORANGETIPS		
Anthocharis sara	Sara's orangetip	
Pieris rapae	cabbage white	
Pontia protodice	common (checkered) white	
Colias harfordii	Harford's sulfer	
NYMPHALIDAE - BRUSH-FOOTED BUTTERFLIES		
Vanessa cardui	painted lady	
DANAIDAE - MILKWEED BUTTERFLIES		
Danaus plexippus	monarch	
HESPERIDAE - SKIPPERS		
Pyrgus albescens	white checkered-skipper	
Erynnis funeralis	funereal duskywing	
RIODINIDAE - METALMARKS		
Apodemia mormo	Behr's (Mormon) metalmark	
LYCAENIDAE - BLUES, HAIRSTREAKS AND COPPERS		
Plebejus acmon	acmon blue	
Brephidium exilis	western pygmy-blue	
Leptotes marina	marine blue	
AMPHIBIANS		
HYLIDAE - TREEFROG FAMILY		
Pseudacris cadaverina	California treefrog	
Pseudacris hypochondriaca	Baja California treefrog	
LIZARDS		
PHRYNOSOMATIDAE - SPINY LIZARD FAMILY		
Sceloporus occidentalis	western fence lizard	
SNAKES		
COLUBRIDAE - COLUBRID SNAKE FAMILY		
Pituophis catenifer	gopher snake	
BIRDS		
ANATIDAE - SWAN, GOOSE, AND DUCK FAMILY		
Branta canadensis	Canada goose	
Mareca americana	American wigeon	
Anas platyrhynchos	mallard	
Aythya affinis	lesser scaup	
Oxyura jamaicensis	ruddy duck	
ODONTOPHORIDAE - NEW WORLD QUAIL FAMILY		
Callipepla californica	California quail	

WILDLIFE SPECIES OBSERVED

Species		Special Status
Scientific Name	**Common Name**	
PODICIPEDIDAE - GREBE FAMILY		
Aechmophorus occidentalis	western grebe

Eremophila alpestris actia	California horned lark	
HIRUNDINIDAE - SWALLOW FAMILY		
Stelgidopteryx serripennis	northern rough-winged swallow	
Petrochelidon pyrrhonota	cliff swallow	
AEGITHALIDAE - BUSHTIT FAMILY		
Psaltriparus minimus	bushtit	
TROGLODYTIDAE - WREN FAMILY		
Troglodytes aedon	house wren	
Thryomanes bewickii	Bewick's wren	
Campylorhynchus brunneicapillus sandiegensis	coastal cactus wren	SSC
POLIOPTILIDAE - GNATCATCHER FAMILY		
Polioptila caerulea	blue-gray gnatcatcher	
Polioptila californica	California gnatcatcher	FT, SSC (subsp. californica)
SYLVIIDAE - SILVIID WARBLERS FAMILY		
Chamaea fasciata	wrentit	
MIMIDAE - MOCKINGBIRD AND THRASHER FAMILY		
Toxostoma redivivum	California thrasher	
Mimus polyglottos	northern mockingbird	
STURNIDAE - STARLING FAMILY		
*Sturnus vulgaris**	European starling*	
FRINGILLIDAE - FINCH FAMILY		
Haemorhous mexicanus	house finch	
Spinus psaltria	lesser goldfinch	
PASSERELLIDAE - NEW WORLD SPARROW FAMILY		
Pipilo maculatus	spotted towhee	
Aimophila ruficeps	rufous-crowned sparrow	
Melozone crissalis	California towhee	
Melospiza melodia	song sparrow	
ICTERIDAE - BLACKBIRDS AND ORIOLES		
Sturnella neglecta	western meadowlark	
Icterus cucullatus	hooded oriole	
Agelaius phoeniceus	red-winged blackbird	
PARULIDAE - WOOD-WARBLER FAMILY		
Geothlypis trichas	common yellowthroat	
Setophaga coronata	yellow-rumped warbler	

WILDLIFE SPECIES OBSERVED

Species		Special Status
Scientific Name	**Common Name**	
MAMMALS		
SCIURIDAE - SQUIRREL FAMILY		
Otospermophilus beecheyi	California ground squirrel	
GEOMYIDAE - POCKET GOPHER FAMILY		
Thomomys bottae	Botta's pocket gopher	
CRICETIDAE - NEW WORLD RATS AND MICE FAMILY		
Neotoma bryanti	Bryant's woodrat	
LEPORIDAE - HARE AND RABBIT FAMILY		
Sylvilagus audubonii	desert cottontail	
CANIDAE - CANID FAMILY		
Canis latrans	coyote	
MEPHITIDAE - SKUNK FAMILY		
Mephitis mephitis	striped skunk	
PROCYONIDAE - PROCYONID FAMILY		
Procyon lotor	northern raccoon	
CERVIDAE - CERVID FAMILY		
Odocoileus hemionus	southern mule deer

Glaucopsyche lygdamus (Silvery Blue)					
Plebejus acmon (Acmon Blue)					
Celastrina ladon (Spring Azure)					

Surveyor Lindsay Messett Date: 2/18/22

Comments:

Several polygons containing Plantago. The Plantago is very small and patchy but flowering. Most nectar sources aren't flowering yet but are present and should be flowering soon.

Plant Communities and Habitat Information:

Surveys were conducted in sagebrush scrub, disturbed sage brush scrub, disturbed floodplain sagebrush scrub, annual grassland, ruderal and disturbed areas (dirt roads).

Host Plants Present:

Pontago erecta
Castilleja exserta

Nectar Plants Present:

Popcornflower, fiddleneck, red maids, buckwheat, blue dicks, gold fields, mustard, erodium.

Surveyor Lindsay Nesseth Date: 2/19/22

Comments:
Most of the survey area is lower quality w/ ruderal and disturbed areas, however ther is one large area that contains Plantago and nectar sources. There is also good quality habitat immediately adjacent to this polygon.
Plant Communities and Habitat Information:
Sagebrush scrub, disturbed sagebrush scrub, disturbed floodplain sagebrush scrub, annual grassland, ruderal and disturbed areas.
Host Plants Present:
Plantago erecta Castilleja exserta
Nectar Plants Present:
Blue dicks, buckwheat, fiddleneck, oxalis, mustard, lupine, red maids, gold fields

Surveyor Lindsay Messett Date: 2/25/22

Comments:

Plantago is still small in most Blygons but larger in a few too. Nectar sources are flowering more.

→ a crew was weeding a large area on the back slope of the dam. The area contained mostly non-natives (grasses) but did also contain scattered CBS shrubs and nectar sources (primarily fiddleneck w/ some blue dicks) The crew parked trucks on Plantago. I asked them to move and keep all equipment on the other side of the road.

Plant Communities and Habitat Information:

Sagebrush / disturbed Sagebrush Scrub, disturbed floodplain sagebrush scrub, annual grassland, ruderal, disturbed areas

Host Plants Present:

Plantago erecta
Castilleja exserta

Nectar Plants Present:

fiddleneck, blue dicks, popcorn flower, buckwheat, goldfields, mustard, erodium, red maids

Surveyor Lindsay Messett Date: 3/10/22

Comments:

Plantago and Castilleja still blooming and looking good. Some nectar sources are dying off but others are now blooming. This weeks survey had the most nectar sources blooming.

Plant Communities and Habitat Information:

Sagebrush / disturbed sagebrush scrub, disturbed floodplain sagebrush scrub, annual grassland, ruderal, disturbed areas

Host Plants Present:

Plantago erecta
Castilleja exserta

Nectar Plants Present:

lupine, buckwheat, mustard, blue dicks, red maids, fiddleneck, popcornflower, goldfields.

Subject: Results of a Focused Presence/Absence Surveys for Crotch's Bumble Bee for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Justin Garcia, Hillary Sardiñas, and Kyle Rice:

This Letter Report presents the results of focused surveys for the Crotch's bumble bee (*Bombus crotchii*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California (Exhibit 1). The purpose of the surveys was to determine the presence or absence of the Crotch's bumble bee in the biological survey area. Surveys were conducted by a Biologist who holds the necessary Memorandum of Understanding (MOU) to handle this species and were completed according to the guidelines established by the California Department of Fish and Wildlife (CDFW 2023).

PROJECT LOCATION AND DESCRIPTION

The project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Tel 714.751.7373
www.Psomas.com

The project site is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the project site in the northwest, downstream of the Dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the project site. Elevations in the project site range from approximately 657 to 996 feet above mean sea level.

The project site is located in the Central–Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD) is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

IRWD is proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Department of Safety of Dams, the dam spillway and the dam require structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the design phase but would be located within the survey area provided by IRWD.

SURVEY AREA

A variety of vegetation types occur in the Biological Study Area (BSA) for the project, including sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, western sycamore, and vegetated fluctuating shoreline (Exhibit 3). Other landcovers include cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

The Crotch's bumble bee survey area was limited to the impact areas within the BSA, including permanent and temporary impact areas and the proposed additional inundation area (i.e., a two-foot change in elevation around the entire perimeter of the lake). The survey area included all habitat areas, excluding open water and developed areas.

The survey area contained suitable habitat, and/or nectar sources for Crotch's bumble bee. These areas were generally dominated by California sagebrush (*Artemisia californica*), leafy California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*), deerweed (*Acmispon glaber*), laurel sumac (*Malosma laurina*), lemonade berry (*Rhus integrifolia*), scaly scale-broom (*Lepidospartum squamatum*), toyon (*Heteromeles arbutifolia*), and California brickellbush (*Brickellia californica*). Openings between shrubs have native herbs, such as erect plantain (*Plantago erecta*), and narrow-toothed pectocarya (*Pectocarya linearis* ssp. *ferocula*), as well as non-native fennel (*Foeniculum vulgare*) and non-native grasses (*Avena* sp. and *Bromus* spp.).

While all habitat was surveyed, higher amounts of time were spent in habitats that provided suitable feeding areas (i.e., those areas with flowering plants) and potential nesting areas (i.e., those areas with rodent burrows, leaf litter, and brush piles) within the survey area (Exhibit 3). Less time was spent in marginal/lower quality habitat where suitable nectar sources were not readily available (i.e. cliff, coast live oak woodland, disturbed mulefat scrub, mulefat scrub, disturbed southern black willow forest, southern black willow forest, fluctuating shoreline, southern sycamore riparian woodland, southern willow scrub, and western sycamore).

Plants with flowers blooming during these surveys included the following: short-podded mustard (*Herschfeldia incana*), black mustard (*Brassica nigra*), Italian thistle (*Carduus pycnocephalus* ssp. *pycnocephalus*), telegraph weed (*Heterotheca grandiflora*), narrow leaf milkweed (*Asclepias fascicularis*), California buckwheat, deerweed, black sage (*Salvia melifera*), white sage (*Salvia apiana*), tree tobacco (*Nicotiana glauca*), California cudweed (*Pseudognaphalium californicum*), laurel sumac, clustered small tarweed (*Madia exigua*), toyon, Wright's jimsonweed (*Datura wrightii*), bristly ox-tongue (*Helminthotheca echioides*), prickly lettuce (*Lactuca serriola*), golden yarrow (*Eriophyllum confertiflorum var. confertiflorum*), monkey flower (*Diplacus australis*), vinegar weed (*Trichostema lanceolatum*), saltcedar (*Tamarix ramosissima*), and scaly scale-broom. These flowering plants were distributed throughout the survey area and decreased in number over the time between the first and third surveys. Photographs of representative habitat in the survey area are provided in Attachment A.

BACKGROUND

The Crotch's bumble bee is a near endemic species in California. It occurs throughout most of southwestern California including the Mediterranean region, along the Pacific coast, western deserts, Great Valley, and adjacent foothills (Williams *et al.* 2014; Zungri 2005). It was historically common in the Central Valley of California, but currently appears to be absent from most of it, especially in the center of its historic range (Hatfield *et al.* 2014). It has also been documented in southwest Nevada near the California border and in Baja California, Mexico in the Sierra de Jaurez Mountain Range (Labougle 1990; Williams 2014); however, there are only 12 records of this species in Mexico (ECOSUR 2014). While this species can be found in most native habitats, it prefers grassland and scrub habitat types.

Bumble bees are social insects that live in colonies composed of a queen, workers, males, and gynes/new queens. Colonies are annual and only the new, mated queens overwinter. The mated queens emerge from hibernation in the spring and begin forage for pollen and nectar and look for a new colony nest location. Bumble bees do not dig their own nest cavities, but instead utilize abandoned rodent burrows, hollow logs, leaf litter, tufted grass patches, rock piles, and above ground man-made structures. The Crotch's bumble bee is a ground nester and often makes its nest in abandoned mammal burrows. Once a nest site is located, the queen will lay

the first clutch of eggs. After hatching, the larvae feed on stored pollen (i.e., brood clump) for approximately two weeks before pupating for another two weeks. The adults that emerge from these pupae are females/workers who then take over foraging for resources, and tending to new clutches of eggs and larvae, while the queen lays more eggs. The workers/females also help to regulate the temperature of the nest and defend the nest against predators (Williams 2014). Colonies persist through the spring and summer months with successive broods of workers/females being produced as more floral resources become available. At some point in the summer, the colony switches to produce males and queens. The timing of this switch is not well understood but is generally thought to be related to the age of the queen and the size of the colony (Williams 2014). Adult male bumble bees do not forage for the colony but instead, leave the nest to feed at flowers and search for mates. The male Crotch's bumble bee perches on pheromone-scented vegetation and waits for queens to fly by. While male bumble bees feed and search for mates, newly emerged queens leave the colony to feed during the day. The queens eat a large amount of pollen and nectar to build up fat reserves for overwintering. Queens typically mate only once with only one male, and then begin their search for an overwintering location. Little is known about overwintering sites; however, overwintering queens have been reported to use animal burrows, holes in loose dirt, leaves, or compost piles (Williams 2014). Once the new queen has mated, the colony declines, and the remaining bees die before winter begins.

The Crotch's bumble bee is a larger bumble bee with the queen measuring approximately 22 to 25 millimeters (mm) and the workers measuring approximately 12 to 20 mm (Williams 2014). Crotch's bumble bee is a short-tongued species and prefers food plants from the following families: *Asclepias*, *Chaenactis*, *Lupinus*, *Medicago*, *Phacelia*, and *Salvia* (Williams 2014). The hairs on Crotch's bumble bee are very short and even, giving it a clean appearance. The head of this species is considered short, with the cheek (oculo-malar area) distinctly shorter than broad (Williams 2014). Crotch's bumble bee females/workers show yellow only on the front of the thorax and on the second abdominal segment (terga 2), males show yellow on both the front and back of the thorax and on both abdominal segments 1 and 2 (terga 1 and 2). In certain parts of its range, Crotch's bumble bee may also show some reddish-brown coloration on the lower abdomen segments (terga 4 and 5). Bumble bee species most similar in appearance to the Crotch's bumble bee include the brown-belted bumble bee (*Bombus griseocollis*), southern plains bumble bee (*Bombus fraternus*), red-belted bumble bee (*Bombus rufocintus*), frigid bumble bee (*Bombus frigidus*), and Nevada bumble bee (*Bombus nevadensis*) (Williams 2014). These species generally do not occur in southern California; therefore, misidentification of Crotch's with these species is unlikely. Bumble bee species that are present within the southern California range of Crotch's bumble bee include California bumble bee (*Bombus californicus*), yellow-faced bumble bee (*Bombus vosnesenskii*), Vandyke bumble bee (*Bombus vandykii*), and black-tail bumble bee (*Bombus melanopygus*).

Crotch's bumble bee has been impacted by many environmental factors including rapid urbanization and the spread of agriculture. This is most evident in the Central Valley of California where this species now appears to be absent. Climate change, specifically increasing aridity, is an additional threat, especially because Crotch's bumble bee has a very narrow climatic specialization compared to most bumble bees (NatureServe 2014). Bumble bees in general are threatened by several additional factors including pesticide use, pathogens from managed pollinators, as well as competition with non-native bees (Goulson 2010; Williams *et al.* 2009; Williams and Osborne 2009; Cameron *et al.* 2011; Fürst *et al.* 2014; Hatfield *et al.* 2012). Reduced genetic diversity resulting from any of these threats is also a limiting factor

for bumble bee populations, because their method of sex-determination can be disrupted by inbreeding.

The Crotch's bumble bee was proposed as a Candidate to be State listed as Endangered in June 2019. The status of the Crotch's bumble bee has changed multiple times based on court rulings between June 2019 and September 2022. In November 2020, the Sacramento Superior Court ruled that insects are not eligible for listing under the California Endangered Species Act because the law does not mention insects (*Almond Alliance of California v. CDFW*). In February 2021, the California Fish and Game Commission appealed the decision. The Third District Court of Appeals ruled that the bees could be protected because the law's definition of fish includes invertebrates. In September 2022, the California Supreme Court decided that it would not review the petition for appeal, allowing the decision from the Third District Court to stand stating that the intent of the law is to protect declining species. Therefore, the proposed Candidate status was reinstated in September 2022.

SURVEY METHODS

In June 2023, the California Department of Fish and Wildlife (CDFW) issued survey guidelines for Candidate bumble bee species recommending at least three visual surveys conducted two to four weeks apart during the appropriate Colony Active Period (April to August for Crotch's bumble bee) to ensure the highest probability of detecting the species (CDFW 2023). Surveys must be conducted at a rate of three acres per hour within optimal habitat by a qualified Biologist (i.e., one with appropriate permits and experience in the identification of bee species). Psomas Senior Biologist Lindsay Messett (Scientific Collecting Permit [SCP]; 182810004-20009-001[1]) conducted all focused surveys for Crotch's bumble bee. The survey included all suitable foraging and potential nesting habitats for the Crotch's bumble bee in the survey area. Surveys were conducted on June 20 and 21; July 16 and 17; and August 5 and 6, 2024.

Ms. Messett conducted the surveys by walking meandering transects, slowly across the survey area, through all appropriate habitats, to obtain a 100 percent survey cover. The surveys were paced at approximately three acres per hour in optimal habitats but were more quickly paced in areas lacking available nectar sources. Ms. Messett scanned for bee activity on the ground and spent additional time at any flowering plants to look for foraging bees. Potential nest sites (e.g., forest edges, unmowed areas, and cavities such as mammal burrows) were inspected with binoculars for evidence of bumble bee use. If multiple exiting/entering bumble bees were observed at a cavity, further observation was made until nesting could be confirmed (e.g., multiple individuals entering the cavity).

Surveys were non-lethal (capture, photograph, release) and were conducted in accordance with the CDFW Survey Considerations for California Endangered Species Act Candidate Bumble Bee Species (CDFW 2023) and authorizations in Ms. Messett's SCP and MOU issued by CDFW. All bumble bees observed were captured using a butterfly net. Bees were carefully transferred to a clear, plastic vial and placed in a cooler with ice to chill. Once the bees were cooled, they were removed from the vial and photographed. Photographs focused on specific identifiable areas of the bees (i.e. the top of the abdomen, side of the thorax and abdomen, and the front and side views of the head). The bees were processed within 15 minutes of capture

[1] Lindsay Messett's SCP includes a MOU to allow her to capture and handle Crotch's bumble bee according to the survey guidelines.

and were released within 100 feet of the capture site. Bumble bee species were identified by Ms. Messett using *Bumble Bees of North America: An Identification Guide* (Williams *et al.* 2014). Photographs of the bumble bees observed during the surveys were also provided to taxonomist Dr. Keng-Lou James Hung, PhD (University of Oklahoma) to confirm species identification; representative photos are included in Attachment A.

Surveys were conducted at least one hour after sunrise and two hours before sunset (ideally between 9:00 AM and 1:00 PM) during suitable weather conditions. Surveys should be conducted on warm, but not hot, sunny days (i.e., between 65 and 90 degrees Fahrenheit [°F]) with low wind (i.e., wind speed less than 8 miles per hour). Surveys may be conducted during partly cloudy or overcast conditions if a person's shadow is visible; however, surveys should not be conducted during wet, foggy, or rainy conditions. A summary of weather conditions during each survey is provided in Table 1. Survey data was recorded on Bumble Bee Survey Field Datasheets (adapted for Crotch's bumble bee from Protocols for the Rusty Patched Bumble Bee) and are included as Attachment B.

Ms. Messett is a Certified Wildlife Biologist® with the Wildlife Society and has over 24 years of experience in surveying special status wildlife species throughout southern and central California including invertebrates, birds, amphibians, and mammals. She currently holds a U.S. Fish and Wildlife Service 10(a)(1)(A) permit (TE 067064-6) for the following invertebrate species: Quino checkerspot butterfly and El Segundo blue butterfly. She also holds a CDFW SCP (S-182810004-20009-001) that includes the following invertebrate species: Quino checkerspot butterfly and Crotch's bumble bee in addition to a MOU for handling and processing Crotch's bumble bee. Ms. Messett has attended multiple bumble bee trainings and live webinars presented by the The Xerces Society in partnership with the Western Section of the Wildlife Society including the California Rare Bumble Bees Workshop (May 4, 2021), The Bumble Bee Field Course (July 21–23, 2023), Western Bumble Bee Identification for Bumble Bee Atlas Volunteers (October 11, 2023), and Male Bumble Bee Identification along the Pacific Coast of North America (December 6, 2023). She is also a listed volunteer on the Xerces Society's SCP (S-210530001-21053-001) and MOU (Dated October 18, 2022).

SURVEY RESULTS

One male Crotch's bumble bee was observed during the second focused survey on July 17, 2024, upstream of Santiago Dam. This individual was observed foraging in a small patch of leafy California buckwheat, in the southern portion of the survey area (Exhibit 3). No Crotch's bumble bees were observed during the third focused survey. A California Natural Diversity Database (CNDDB) form for this observation will be submitted electronically by Ms. Messett and is included in Attachment C.

At the time of the focused surveys, most plants were no longer flowering. The available floral resources in the survey area during the late summer appeared to provide a limited amount of habitat for bumble bees; floral resources were likely higher in the spring and early summer. The estimated percent cover of floral resources was approximately 20 to 30 percent of the survey area during the June visit. Percent cover of floral resources continually decreased on the second and third surveys. During the focused surveys, the species in bloom consisted primarily of short-podded mustard, black mustard, leafy California buckwheat and deerweed. The entire survey area was surveyed; however, more time was spent in areas that had the most flowering resources during each survey. Potential bumble bee nest sites and overwintering habitat included small rodent burrows and leaf litter located in the survey area.

The following bees were also observed during the focused surveys: western honeybee (*Apis mellifera*), yellow-faced bumble bee, California bumble bee, and black-tailed bumble bee.

Photographs of all bumble bees were submitted to taxonomist Dr. Keng-Lou James Hung and identifications were confirmed.

OTHER OBSERVATIONS

Two additional special status species were observed in the survey area during the surveys: coastal California gnatcatcher (*Polioptila californica californica*), a federally listed Threatened and California Species of Special Concern, and least Bell's vireo (*Vireo bellii pusillus*), a federally and State listed Endangered species (Exhibit 3). The CNDDB forms for these species are included in Attachment C and have been submitted online by Ms. Messett.

RECOMMENDATIONS

Because Crotch's bumble bee was observed during the focused surveys, IRWD would need to consult with CDFW to obtain an Incidental Take Permit for the loss of Crotch's bumble bee habitat. Avoidance and minimization measures would also be required to minimize take of the species.

Per CDFW guidelines, it is recommended that a biological monitor be present onsite during vegetation clearing and/or ground-disturbing activities that take place during the queen flight period (i.e., February to March), colony active period (i.e., April to August), or gyne flight period (i.e., September to October). No biological monitoring would be required if vegetation clearing or ground-disturbing occurs from November to January.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Lindsay Messett (Lindsay.Messett@psomas.com).

Sincerely,
PSOMAS

Scientific name: *Bombus crotchii*

Common name: Crotch's bumble bee

Date of field work (mm-dd-yyyy): 07-17-2024

Comment about field work date(s):

OBSERVER INFORMATION

Observer: Lindsay A. Messett

Affiliation: Psomas

Address: 7236 E Stearns Street , Long Beach, CA 90815

Email: lindsay.messett@psomas.com

Phone: (562) 833-4276

Other observers:

DETERMINATION

Keyed in:

Compared w/ specimen at:

Compared w/ image in:

By another person: Confirmed by taxonomist

Other: Familiarity with the species, and hold a MOU for handling the species

Identification explanation:

Identification confidence: Very confident

Species found: Yes **If not found, why not?**

Level of survey effort: Observed during focused surveys.

Total number of individuals: 1

Collection? No **Collection number:**

Museum/Herbarium:

ANIMAL INFORMATION

How was the detection made? Seen

Number detected in each age class:

adults	juveniles	larvae	egg mass	other
1				

Age class comment: Individual was an adult male.

Site use description: Site provides nectar, pollen and nesting habitat.

What was the observed behavior? The individual was observed foraging in a small patch of leafy California buckwheat (Eriogonum fasciculatum var. foliolosum).

Describe any evidence of reproduction: The site provides abundant small rodent burrows that are suitable for nest locations.

SITE INFORMATION

Habitat description: Disturbed sagebrush scrub

Slope: Landowner/manager: Private - Irvine Ranch

Aspect:

Site condition + population viability: Good

Immediate & surrounding land use: Irvine Lake, open space within the NCCP Reserve and Irvine Regional Park

Visible disturbances: Human activities: fishing, hiking, motor vehicles driving on surrounding access roads

Threats: Non-native vegetation

General comments:

DETERMINATION

Keyed in:

Compared w/ specimen at:

Compared w/ image in:

By another person:

Other: Familiarity with the species

Identification explanation: Individuals were heard calling then subsequently observed foraging within sagebrush scrub vegetation.

Identification confidence: Very confident

Species found: Yes **If not found, why not?**

Level of survey effort: Incidentally observed during focused Crotch's bumble bee surveys

Total number of individuals: 2

Collection? No **Collection number:**

Museum/Herbarium:

ANIMAL INFORMATION

How was the detection made? Heard calling then seen

Number detected in each age class:

adults	juveniles	larvae	egg mass	other
1	1			

Age class comment: Adult male traveling with one fledgling

Bird site use:

☑ **Nesting** ☐ **Rookery** ☐ **Nesting colony** ☐ **Burrow site** ☐ **Lek**

☐ **Non-breeding (over-wintering)** ☐ **Communal roost** ☐ **Other (foraging, fly-over, etc.)**

Site use description: Used for nesting and foraging

What was the observed behavior? Adult male was observed traveling and foraging with one fledgling

Describe any evidence of reproduction: The presence of a fledgling indicates successful breeding occurred in the immediate vicinity.

SITE INFORMATION

Habitat description: Sagebrush scrub

Slope: Landowner/manager: Private - Irvine Ranch

Aspect:

Site condition + population viability: Good

Immediate & surrounding land use: Irvine Lake, open space in NCCP Reserve and Irvine Regional Park

Visible disturbances: Non-native vegetation

Threats:

Subject: Results of Focused Presence/Absence Surveys for Arroyo Toad for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love:

This Letter Report presents the results of focused diurnal and nocturnal surveys to determine the presence or absence of the arroyo toad (*Anaxyrus californicus*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "Project") located in Orange County, California (Exhibit 1).

PROJECT DESCRIPTION AND LOCATION

The Irvine Ranch Water District and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left (west) abutment of the existing dam. Additionally, based on feedback from the Department of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The Project is currently in the early design phase.

Santiago Creek Dam is located at the north end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). The survey area is located northeast of State Route (SR) 261 and southeast of State Route 241 (SR-241). The survey area is depicted on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Topography is relatively flat, with rolling hills to the east and a steep cliff to the west. Elevations range from approximately 635 to 898 feet above mean sea level (msl). Santiago Creek, a blueline stream, occurs in the survey area. Santiago Creek travels roughly northwest, and a tributary from Fremont Canyon joins it from the east. Fremont Canyon is characterized by very steep slopes, shallow soils, and watercourses contained within bedrock channels. Surrounding land uses primarily consist of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Nature Preserve is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. Residential development is located west of SR-241.

The survey area for the arroyo toad surveys included all suitable habitat along Santiago Creek extending 0.62 mile (1 kilometer) upstream of the project survey area, which includes a tributary from Fremont Canyon (Exhibit 3). The following vegetation types and other areas occur within the project survey area: sagebrush scrub, disturbed sagebrush scrub, disturbed floodplain sage scrub, toyon – sumac chaparral, annual grassland, ruderal, southern willow

scrub, mulefat scrub, coast live oak woodland, western sycamore, cliff, open water, ornamental, developed, and disturbed. Representative site photos are included in Attachment A.

SPECIES BACKGROUND

The arroyo is a federally listed Endangered species and a California Species of Special Concern. At the time of listing, the arroyo toad was considered a subspecies of southwestern arroyo toad (*Bufo microscaphus*) until genetic studies (Gergus 1998) separated the arroyo toad (*B. californicus*) from the Arizona toad (*B. microscaphus*). Recent research (Frost et al. 2006) places both species in the genus *Anaxyrus*.

The arroyo toad is a small, olive green or gray to tan toad with warty skin and dark spots. It has a light-colored V-shaped stripe across the head between and including the eyelids, and a light spot on each sacral hump and in the middle of its back. It normally lacks a mid-dorsal stripe (i.e., a stripe down the center of its back). The underside of the arroyo toad is usually buff-colored and unspotted. The parotid glands are oval-shaped, widely separated, and pale toward the front; and the cranial crests are absent or weak. Reproductive adult toads typically range from 2.2 to 2.6 inches snout to vent length for males and 2.6 to 3.3 inches for females (USFWS 1999). Its movement consists of hopping rather than walking (USFWS 1994). Arroyo toads are nocturnal (i.e., active at night). Adults feed primarily on ants but will also consume beetles, spiders, larvae, caterpillars, and other invertebrates (USFWS 2009). Males become sexually mature in one to two years, and females become sexually mature in two to three years; arroyo toads can live up to five years (Sweet 1992, 1993).

Tadpoles are black in coloration at hatching and develop a tan coloration on the upper side; gold and dark crossbars on the tail; and an opaque, white venter on the underside before metamorphosing (Sweet 1992; USFWS 1999). Tadpoles typically metamorphose at a length of 1.1 to 1.6 inches (USFWS 1999). Juveniles have a white-gray-tan coloring with dark spots on the upper side and a white underside. The V-shaped line on the head is visible on juveniles, but the parotid glands are typically not yet visible (Sweet 1992; Sanders 1950). Juveniles usually grow to about 1.2 to 1.6 inches their first year (sometimes up to 2.0 inches) and then do not grow again until the following spring (Sweet 1992).

The arroyo toad population is currently distributed in coastal drainages and along the desert slopes of the Transverse and Peninsular Ranges from approximately 1,000 feet to 4,600 feet above mean sea level; however, the species has been recorded from sea level to 8,000 feet above msl in Baja California (Patten and Myers 1992; Jennings and Hayes 1994; Welsh 1988; Beaman et al. 1995; USFWS 1999). It occurs in intermittent washes/streams and perennial streams. In the northern portion of their range, they generally occur in third- to sixth-order[1] or greater streams; however, in the southern portion of their range, they can occur in first- and second-order streams (USFWS 1999; Griffin et al. 1999; USFWS 2009). “Episodic flooding is critical to keeping the low stream terraces relatively vegetation free and soils friable enough for juveniles and adults to create burrows” (Jennings and Hayes 1994). The most favorable breeding habitat for arroyo toad consists of slow-moving streams with shallow pools, nearby sandbars, and adjacent stream terraces.

Outside the breeding season, arroyo toads are essentially terrestrial, using a variety of upland habitats, including sycamore-cottonwood woodlands, oak woodlands, coastal sage scrub, chaparral, and grasslands (Holland 1995; Griffin et al. 1999; USFWS 2009). Adult toads burrow into sandy terraces where they shelter during the day when the surface is damp or during longer periods during the dry season (Sweet 1989). During the non-breeding season (i.e., August–January), arroyo toad will aestivate (a state of

[1] Stream order is a relative size of streams. The smallest tributaries are referred to as first-order streams. Two first-order streams combine to create a second-order stream, and so on (Sweet 1992).

dormancy similar to hibernation) to prevent dehydration during hot or dry times of the year (Ramirez 2003).

Adult male arroyo toads will sometimes travel 1.2 to 1.9 miles along a stream course, often becoming more sedentary once reaching a large size. Females are more sedentary, typically maintaining an area of movement less than 330 feet. Adult and subadult arroyo toads can range widely into the uplands, commonly 0.3 mile, with some movements up to 1.2 miles from the stream (USFWS 1999).

During the breeding season, typically from February to July, males will make advertisement vocalizations above water from shallow areas along the creek margins. The advertisement call is a soft, high, whistling trill that lasts from 4 to 9 seconds in duration and is audible up to approximately 985 feet under ideal conditions (Gergus et al. 1997). Two parallel egg strings of 2,000 to 10,000 eggs are deposited in shallow water (i.e., usually less than 4 inches in depth with an average of 1.4 inches) on fine sediment with very low current (0.2 foot per second) and little or no emergent vegetation (Sweet 1992; USFWS 1999). These eggs hatch four to six days later (Sweet 1992). Streams where arroyo toad occur must have water from approximately late March through mid-June to allow tadpoles to develop (Sweet 1989). The tadpole stage usually lasts about ten weeks (USFWS 2009). Tadpoles feed on loose organic material such as interstitial algae, bacteria, and diatoms from just beneath the surface layer of fine sediments or within the interstices of gravel deposits; they do not forage on macroscopic vegetation (Sweet 1992; Jennings and Hayes 1994; USFWS 2009). After metamorphosis in June or July, the juveniles remain on the adjacent gravel bars or sandy stream terraces for 8 to 12 weeks (depending on site conditions and rainfall), where they forage for insects (Sweet 1992; USFWS 1994).

On February 9, 2011, the USFWS published the Revised Critical Habitat for the arroyo toad. The Revised Critical Habitat designated 98,366 acres of critical habitat for the arroyo toad in portions of Santa Barbara, Ventura, Los Angeles, San Bernardino, Riverside, Orange, and San Diego Counties, California (USFWS 2011). The survey area is not located in designated Critical Habitat for this species.

This species is a Conditionally Covered Species in the Central Coastal Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The NCCP/HCP states that “within the subregion, arroyo toad may occur in Limestone Canyon, Boxer Canyon (in the Santiago Canyon drainage), and the Silverado watershed… None of these areas have been thoroughly surveyed for arroyo toad” (County of Orange 1996). The NCCP/HCP also states that the Transportation Corridor Agency conducted surveys in the Santiago Creek area and have not identified the presence of the species (County of Orange 1996). The records in the California Natural Diversity Database match those reported from the NCCP/HCP; there is a 1974 record from Limestone Canyon and a record with no date from a tributary of Silverado Canyon (CDFW 2020). There have been no recent observations of the species reported in the vicinity.

SURVEY METHODS

The USFWS’ 1999 Arroyo Toad Protocol requires that a minimum of six surveys be performed during the breeding season (i.e., March 15–July 1), with at least one survey conducted in April, one in May, and one in June. The surveys included diurnal and nocturnal searches to determine the presence of eggs, tadpoles, and adults. During the diurnal surveys, water was examined for the presence of arroyo toad egg masses and tadpoles. Nocturnal surveys began one hour after dusk during weather conditions conducive to toad activity. Nocturnal search methods included walking along the creek banks and stopping periodically to listen for the breeding calls of adult males. Headlamps and flashlights were used to visually identify toads when a breeding call was heard. If any arroyo toads were found, the individual or population was documented, recorded with a Global Positioning System unit, and mapped on an aerial

photograph. The number of individuals were noted on each subsequent visit, and data were collected on general habitat characteristics for any arroyo toads observed.

Psomas Senior Biologists Jonathan Aguayo and Lindsay Messett conducted the focused surveys in all potentially suitable habitat for arroyo toad in the survey area according to the USFWS-established survey methodology described above. The survey area included all suitable habitat along Santiago Creek, including a tributary from Fremont Canyon. Mr. Aguayo and Ms. Messett conducted focused surveys for the arroyo toad on April 17 and 24; May 15 and 22; and June 12 and 19, 2020.

Diurnal surveys were conducted from approximately 5:00 PM until dusk, and nocturnal surveys were conducted from one hour after dusk until approximately 10:30 PM. Surveys focused on detecting toads by visual identification; listening for the advertising call of adult males; and checking potentially suitable breeding habitat for tadpoles and/or eggs. Biologists scanned pools for eggs, larvae, metamorphs, juveniles, and breeding and/or calling adults in potentially suitable breeding locations along the creek, and for foraging individuals in the adjacent riparian and upland areas. Surveyors moved in an upstream direction during the surveys. Headlamps, flashlights, and binoculars were used to visually identify toads, frogs, and their larvae detected at night. Nocturnal surveys were conducted during appropriate environmental conditions conducive to the activity patterns of the arroyo toad. Generally, these conditions are nighttime temperatures greater than 50 degrees Fahrenheit (°F) at dusk, with low winds (less than 10 miles per hour); nights with a full or nearly full moon were avoided. Survey dates, times, and weather data are shown in Table 1. Survey conditions and results were documented in field notes.

TABLE 1
SUMMARY OF SURVEY DATA AND CONDITIONS FOR ARROYO TOAD

Survey	Survey Date	Survey Type	Surveying Biologists	Start/End Time	Wind (miles/hour)		Temperature (°F)		Cloud Cover
					Start	End	Start	End

°F: degrees Fahrenheit.

SURVEY RESULTS

No arroyo toad was observed or detected within the survey area during the focused surveys.

Other amphibian species detected during surveys include western toad (*Anaxyrus boreas*), California treefrog (*Pseudacris cadaverina*), and Baja California treefrog (*Pseudacris hypochondriaca*). Representative photos of the frogs observed are included in Attachment A. A complete list of all wildlife species detected during the surveys is provided in Attachment B.

OTHER OBSERVATIONS

Two-striped garter snake (*Thamnophis hammondii*), a California Species of Special Concern, was observed during the survey conducted on May 15, 2020 (Exhibit 4). A California Natural Diversity Database (CNDDB) form documenting this observation is included in Attachment C and will be submitted online to the California Department of Fish and Wildlife (CDFW) by Mr. Aguayo.

A male coastal California gnatcatcher (*Polioptila californica californica*), a federally listed Threatened species and a California Species of Special Concern, was detected during the survey conducted on May 15, 2020. Coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*), a Species of Special Concern, was detected on multiple surveys. CNDDB forms documenting these species will be included with the Results of Coastal California Gnatcatcher Survey Report and will be submitted online by Ms. Messett.

American peregrine falcon (*Falco peregrinus anatum*), a CDFW Fully Protected species, was detected during the survey conducted on April 24, 2020 (Exhibit 4). The American peregrine falcon was not observed nesting in the survey area; therefore, a CNDDB form was not prepared for this species.

Psomas appreciates the opportunity to assist on this Project. If you have any comments or questions, please call Amber Heredia at 714.751.7373.

Sincerely,
PSOMAS

Amber O. Heredia

Subject: Results of Focused Presence/Absence Surveys for Arroyo Toad for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love:

This Letter Report presents the results of focused diurnal and nocturnal surveys to determine the presence or absence of the arroyo toad (*Anaxyrus californicus*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "project site") located in Orange County, California (Exhibit 1). The purpose of the surveys was to determine the presence or absence of the arroyo toad upstream of Santiago Creek Dam/Irvine Lake. Focused surveys were conducted downstream of Santiago Creek Dam in Spring 2020 (Psomas 2020). Surveys were conducted by a Biologist with the necessary experience and were completed according to the guidelines established by the U.S. Fish and Wildlife Service (USFWS).

PROJECT DESCRIPTION AND LOCATION

The project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). The Biological Study Area includes Santiago Creek Dam, downstream areas along Santiago Creek, areas around Irvine Lake, and upstream areas along Santiago Creek. The Biological Study Area is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

The Biological Study Area is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the Biological Study Area in the northwest, downstream of the dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the Biological Study Area. Elevations in the Biological Study Area range from approximately 657 to 996 feet above mean sea level (msl).

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Fax 714.545.8883
www.Psomas.com

The Biological Study Area is in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Creek Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD)[1] is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The IRWD and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Division of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the design phase. Staging areas are currently planned to be placed in disturbed areas on the east side of Irvine Lake, adjacent to where Santiago Creek flows into the lake. Focused surveys were conducted along Santiago Creek upstream of the lake to determine whether arroyo toad is present or absent adjacent to the proposed staging areas on the east side of the lake.

SURVEY AREA

The arroyo toad survey area included all suitable habitat along Santiago Creek, extending 0.62 mile (1 kilometer) from the most upstream project impact on the east side of Irvine Lake (Exhibit 3). The following vegetation types and other areas occur within the arroyo toad survey area: sagebrush scrub, ruderal, riparian herb, disturbed mulefat scrub, southern sycamore riparian woodland, southern black willow forest, disturbed southern black willow forest, and coast live oak woodland. Site photographs of representative habitat in the survey area are provided in Attachment A.

SPECIES BACKGROUND

The arroyo is a federally listed Endangered species and a California Species of Special Concern. At the time of listing, the arroyo toad was considered a subspecies of southwestern arroyo toad (*Bufo microscaphus*) until genetic studies (Gergus 1998) separated the arroyo toad (*B. californicus*) from the Arizona toad (*B. microscaphus*). Recent research (Frost et al. 2006) places both species in the genus *Anaxyrus*.

The arroyo toad is a small, olive green or gray to tan toad with warty skin and dark spots. It has a light-colored V-shaped stripe across the head between and including the eyelids, and a light spot on each sacral hump and in the middle of its back. It normally lacks a mid-dorsal stripe (i.e., a stripe down the center of its back). The underside of the arroyo toad is usually buff-colored and unspotted. The parotid glands are oval-shaped, widely separated, and pale toward the front; and the cranial crests are absent or weak. Reproductive adult toads typically range from 2.2 to 2.6 inches snout to vent length for males and 2.6 to 3.3 inches for females (USFWS 1999). Its movement consists of hopping rather than walking (USFWS 1994). Arroyo toads are nocturnal (i.e., active at night). Adults feed primarily on ants but will also consume beetles, spiders, larvae, caterpillars, and other invertebrates (USFWS 2009). Males become sexually mature in one to two years, and females become sexually mature in two to three years; arroyo toads can live up to five years (Sweet 1992, 1993).

[1] The Santiago County Water District (SCWD) was also a participating jurisdiction in the NCCP/HCP. The SCWD consolidated with IRWD in 2006.

Tadpoles are black in coloration at hatching and develop a tan coloration on the upper side; gold and dark crossbars on the tail; and an opaque, white venter on the underside before metamorphosing (Sweet 1992; USFWS 1999). Tadpoles typically metamorphose at a length of 1.1 to 1.6 inches (USFWS 1999). Juveniles have a white-gray-tan coloring with dark spots on the upper side and a white underside. The V-shaped line on the head is visible on juveniles, but the parotid glands are typically not yet visible (Sweet 1992; Sanders 1950). Juveniles usually grow to about 1.2 to 1.6 inches their first year (sometimes up to 2.0 inches) and then do not grow again until the following spring (Sweet 1992).

The arroyo toad population is currently distributed in coastal drainages and along the desert slopes of the Transverse and Peninsular Ranges from approximately 1,000 feet to 4,600 feet above msl; however, the species has been recorded from sea level to 8,000 feet above msl in Baja California (Patten and Myers 1992; Jennings and Hayes 1994; Welsh 1988; Beaman et al. 1995; USFWS 1999). It occurs in intermittent washes/streams and perennial streams. In the northern portion of their range, they generally occur in third- to sixth-order[2] or greater streams; however, in the southern portion of their range, they can occur in first- and second-order streams (USFWS 1999; Griffin et al. 1999; USFWS 2009). "Episodic flooding is critical to keeping the low stream terraces relatively vegetation free and soils friable enough for juveniles and adults to create burrows" (Jennings and Hayes 1994). The most favorable breeding habitat for arroyo toad consists of slow-moving streams with shallow pools, nearby sandbars, and adjacent stream terraces.

Outside the breeding season, arroyo toads are essentially terrestrial, using a variety of upland habitats, including sycamore-cottonwood woodlands, oak woodlands, coastal sage scrub, chaparral, and grasslands (Holland 1995; Griffin et al. 1999; USFWS 2009). Adult toads burrow into sandy terraces where they shelter during the day when the surface is damp or during longer periods during the dry season (Sweet 1989). During the non-breeding season (i.e., August–January), arroyo toad will aestivate (a state of dormancy similar to hibernation) to prevent dehydration during hot or dry times of the year (Ramirez 2003).

Adult male arroyo toads will sometimes travel 1.2 to 1.9 miles along a stream course, often becoming more sedentary once reaching a large size. Females are more sedentary, typically maintaining an area of movement less than 330 feet. Adult and subadult arroyo toads can range widely into the uplands, commonly 0.3 mile, with some movements up to 1.2 miles from the stream (USFWS 1999).

During the breeding season, typically from February to July, males will make advertisement vocalizations above water from shallow areas along the creek margins. The advertisement call is a soft, high, whistling trill that lasts from 4 to 9 seconds in duration and is audible up to approximately 985 feet under ideal conditions (Gergus et al. 1997). Two parallel egg strings of 2,000 to 10,000 eggs are deposited in shallow water (i.e., usually less than 4 inches in depth with an average of 1.4 inches) on fine sediment with very low current (0.2 foot per second) and little or no emergent vegetation (Sweet 1992; USFWS 1999). These eggs hatch four to six days later (Sweet 1992). Streams where arroyo toad occur must have water from approximately late March through mid-June to allow tadpoles to develop (Sweet 1989). The tadpole stage usually lasts about ten weeks (USFWS 2009). Tadpoles feed on loose organic material such as interstitial algae, bacteria, and diatoms from just beneath the surface layer of fine sediments or within the interstices of gravel deposits; they do not forage on macroscopic vegetation (Sweet 1992; Jennings and Hayes 1994; USFWS 2009). After metamorphosis in June or July, the juveniles remain on the adjacent gravel bars or sandy stream terraces for 8 to 12 weeks (depending on site conditions and rainfall), where they forage for insects (Sweet 1992; USFWS 1994).

---

[2] Stream order is a relative size of streams. The smallest tributaries are referred to as first-order streams. Two first-order streams combine to create a second-order stream, and so on (Sweet 1992).

On February 9, 2011, the USFWS published the Revised Critical Habitat for the arroyo toad. The Revised Critical Habitat designated 98,366 acres of critical habitat for the arroyo toad in portions of Santa Barbara, Ventura, Los Angeles, San Bernardino, Riverside, Orange, and San Diego Counties, California (USFWS 2011). The survey area is not located in designated Critical Habitat for this species.

This species is a Conditionally Covered Species in the Central Coastal NCCP/HCP. The NCCP/HCP states that "within the subregion, arroyo toad may occur in Limestone Canyon, Boxer Canyon (in the Santiago Canyon drainage), and the Silverado watershed… None of these areas have been thoroughly surveyed for arroyo toad" (County of Orange 1996). The NCCP/HCP also states that the Transportation Corridor Agency conducted surveys in the Santiago Creek area and have not identified the presence of the species (County of Orange 1996). The records in the California Natural Diversity Database (CNDDB) match those reported from the NCCP/HCP; there is a 1974 record from Limestone Canyon and a record with no date from a tributary of Silverado Canyon (CDFW 2022). There have been no recent observations of the species reported in the vicinity.

SURVEY METHODS

The USFWS' 1999 Arroyo Toad Protocol requires that a minimum of six surveys be performed during the breeding season (i.e., March 15–July 1), with at least one survey conducted in April, one in May, and one in June. The surveys included diurnal and nocturnal searches to determine the presence of eggs, tadpoles, and adults. During the diurnal surveys, water was examined for the presence of arroyo toad egg masses and tadpoles. Nocturnal surveys began one hour after dusk during weather conditions conducive to toad activity. Nocturnal search methods included walking along the creek banks and stopping periodically to listen for the breeding calls of adult males. Headlamps and flashlights were used to visually identify toads when a breeding call was heard. If any arroyo toads were found, the individual or population would be documented, recorded with a Global Positioning System unit, and mapped on an aerial photograph. The number of individuals would be noted on each subsequent visit, and data collected on general habitat characteristics for any arroyo toads observed.

Psomas Senior Biologists Jonathan Aguayo and Lindsay Messett conducted the focused surveys in all potentially suitable habitat for arroyo toad in the survey area according to the USFWS-established survey methodology described above. The survey area included all suitable habitat along Santiago Creek. Mr. Aguayo and Ms. Messett conducted focused surveys for the arroyo toad on March 25; April 1 and 8; May 27; and June 10 and 23, 2022.

Diurnal surveys were conducted from approximately 4:00 PM until dusk, and nocturnal surveys were conducted from one hour after dusk until approximately 11:00 PM. Surveys focused on detecting toads by visual identification; listening for the advertising call of adult males; and checking potentially suitable breeding habitat for tadpoles and/or eggs. Biologists scanned pools for eggs, larvae, metamorphs, juveniles, and breeding and/or calling adults in potentially suitable breeding locations along the creek, and for foraging individuals in the adjacent riparian and upland areas. Surveyors moved in an upstream direction during the surveys. Headlamps, flashlights, and binoculars were used to visually identify toads, frogs, and their larvae detected at night. Nocturnal surveys were conducted during appropriate environmental conditions conducive to the activity patterns of the arroyo toad. Generally, these conditions are nighttime temperatures greater than 50 degrees Fahrenheit (°F) at dusk, with low winds (less than 10 miles per hour); nights with a full or nearly full moon were avoided. Survey dates, times, and weather data are shown in Table 1. Survey conditions and results were documented in field notes.

TABLE 1
SUMMARY OF SURVEY DATA AND CONDITIONS FOR ARROYO TOAD

Survey	Survey Date	Survey Type	Surveying Biologists	Start/End Time	Wind (miles/hour)		Temperature (°F)		Cloud Cover

°F: degrees Fahrenheit.

SURVEY RESULTS

No arroyo toad was observed or detected in the survey area during the focused surveys.

Other amphibian species detected during surveys include western toad (*Anaxyrus boreas*), California treefrog (*Pseudacris cadaverina*), Baja California treefrog (*Pseudacris hypochondriaca*), and the non-native American bullfrog (*Lithobates catesbeianus*). Representative photos of the frogs/toad observed are included in Attachment A. A complete list of all wildlife species detected during the surveys is provided in Attachment B.

OTHER OBSERVATIONS

Two-striped garter snake (*Thamnophis hammondii*), a California Species of Special Concern, was observed during the surveys. Three individuals were observed during the survey conducted on April 8, 2022 (Exhibit 3). A CNDDB form documenting this observation is included in Attachment C and will be submitted online to the California Department of Fish and Wildlife by Mr. Aguayo.

Psomas appreciates the opportunity to assist on this Project. If you have any comments or questions, please contact Amber Heredia at Amber.Heredia@psomas.com or 714.481.8049.

Sincerely,
PSOMAS

Picoides nuttallii	Nuttall’s woodpecker
FALCONIDAE – FALCON FAMILY	
Falco sparverius	American kestrel
TYRANNIDAE – TYRANT FLYCATCHER FAMILY	
Sayornis nigricans	black phoebe
Myiarchus cinerascens	ash-throated flycatcher
Tyrannus vociferans	Cassin’s kingbird

WILDLIFE COMPENDIUM

Scientific Name	Common Name
CORVIDAE – JAY AND CROW FAMILY	
Aphelocoma californica	California scrub-jay
Corvus corax	common raven
PARIDAE – TITMOUSE FAMILY	
Baeolophus inornatus	oak titmouse
AEGITHALIDAE – BUSHTIT FAMILY	
Psaltriparus minimus	bushtit
TROGLODYTIDAE – WREN FAMILY	
Troglodytes aedon	house wren
Thryomanes bewickii	Bewick's wren
TURDIDAE – THRUSH FAMILY	
Turdus migratorius	American robin
MIMIDAE – MOCKINGBIRD AND THRASHER FAMILY	
Toxostoma redivivum	California thrasher
FRINGILLIDAE – FINCH FAMILY	
Haemorhous mexicanus	house finch
Spinus psaltria	lesser goldfinch
PARULIDAE – WOOD-WARBLER FAMILY	
Cardellina pusilla	Wilson's warbler
EMBERIZIDAE – SPARROW FAMILY	
Chondestes grammacus	lark sparrow
Melospiza melodia	song sparrow
Pipilo maculatus	spotted towhee
Melozone crissalis	California towhee
ICTERIDAE – BLACKBIRDS AND ORIOLES	
Icterus cucullatus	hooded oriole
MAMMALS	
SCIURIDAE – SQUIRREL FAMILY	
Otospermophilus beecheyi	California ground squirrel
LEPORIDAE – HARE AND RABBIT FAMILY	
Sylvilagus audubonii	desert cottontail
VESPERTILIONIDAE – VESPERTILIONID BAT FAMILY	
Order *Chiroptera*	bat
FELIDAE – CAT FAMILY	
Lynx rufus	bobcat (tracks)
Puma concolor	mountain lion (tracks)
CANIDAE – CANID FAMILY	
Canis latrans	coyote (scat)
CERVIDAE – CERVID FAMILY	
Odocoileus hemionus	southern mule deer
* Non-native species

OBSERVER INFORMATION

Observer: Jonathan Aguayo

Affiliation: Psomas

Address: 6292 San Harco Circle , Buena Park, CA 90620

Email: jonathan.aguayo@psomas.com

Phone: (805) 204-6986

Other observers: Lindsay Messett

DETERMINATION

Keyed in:

Compared w/ specimen at:

Compared w/ image in:

By another person:

Other: Familiarity with California snakes through research, workshops and/or training

Identification explanation:

Identification confidence: Very confident

Species found: Yes **If not found, why not?**

Level of survey effort: Incidental observation during arroyo toad surveys.

Total number of individuals: 3

Collection? **Collection number:**

Museum/Herbarium:

ANIMAL INFORMATION

How was the detection made? Seen

Number detected in each age class:

adults	juveniles	larvae	egg mass	unknown
3				

Age class comment:

Site use description:

What was the observed behavior? Swimming in Santiago Creek

Describe any evidence of reproduction: None

SITE INFORMATION

Habitat description: The following vegetation types and other areas occur within the survey area: sagebrush scrub, ruderal, riparian herb, disturbed mulefat scrub, southern sycamore riparian woodland, southern black willow forest, disturbed southern black willow forest, and coast live oak woodland along Santiago Creek.

Slope:

Land owner/manager: Private; Irvine Ranch

Aspect:

Site condition + population viability: Good

Immediate & surrounding land use: Undeveloped open space

Subject: Results of Visual Survey and Trapping Program for Southwestern Pond Turtle for the Santiago Creek Dam Outlet Tower and Spillway Improvements Project, Orange County, California

Dear Jennifer Pareti, Kyle Rice, and Chad Hirano:

This Letter Report presents the results of the visual survey and trapping program for the southwestern [western] pond turtle (*Actinemys pallida* [*Emys marmorata*]) conducted at the Santiago Creek Dam Outlet Tower and Spillway Improvements Project (hereinafter referred to as the "Project site") located in Orange County, California. The purpose of this program was to assess the presence or absence of this species on or adjacent to the Project site. A qualified Biologist with the necessary experience and a California Department of Fish and Wildlife (CDFW) Scientific Collecting Permit conducted the surveys.

PROJECT LOCATION AND DESCRIPTION

The Project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). The Biological Study Area (BSA) includes Santiago Creek Dam, downstream areas of Santiago Creek; Irvine Lake; and upstream areas along Santiago Creek. The BSA is located south of State Route (SR) 261, east of SR-241, and north of Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago

Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

The BSA is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north, and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the BSA in the northwest, downstream of the dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the dam. Elevations in the BSA range from approximately 657 to 996 feet above mean sea level.

The BSA is in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Creek Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD) is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

IRWD is proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, structural improvements will also be made to the dam spillway and dam. Staging areas are currently planned to be placed north (downstream) of the existing dam and in disturbed areas on the southeast side of Irvine Lake, adjacent to where Santiago Creek flows into the lake. Visual surveys and a trapping program have been conducted to determine the presence or absence of southwestern pond turtles in suitable habitat within the BSA. Representative site photographs are included in Attachment A.

SPECIES BACKGROUND

The southwestern pond turtle is a California Species of Special Concern and a U.S. Forest Service Sensitive Species. In 2015, the U.S. Fish and Wildlife Service (USFWS) published a finding that the listing of this species may be warranted and requested that information on this species be submitted to the USFWS for review (USFWS 2015). In 2023, the USFWS proposed to list the southwestern pond turtle as Threatened under the Endangered Species Act (USFWS 2023); a final decision is pending.

Historically, this species was known as the western pond turtle (*Emys marmorata*) or Pacific pond turtle (*Clemmys marmorata*), but its taxonomy has been revised multiple times in recent years due to genetic studies. The species has alternated between the genera *Emys* and *Actinemys*. Current nomenclature recognizes two distinct species: the southwestern pond turtle (*Actinemys pallida*) and the northwestern pond turtle (*Actinemys marmorata*).

The southwestern pond turtle is a relatively flat, dark turtle of moderate size, with a carapace (shell) length that rarely exceeds 10 inches (Spinks et al. 2003). They are cryptically colored

brown, olive brown, or dark brown (USGS 2006b). The carapace is usually brown or blackish in color with a series of darker spots, lines, or dashes that radiate out from the center of each shield (Stebbins and McGinnis 2012). Their head and body have a mottled appearance (USGS 2006b). Males tend to have thicker tails, while females have thinner tails. Males tend to have concave plastrons (i.e., shells), while females tend to have flat or slightly convex plastrons; the carapaces of females are also taller to allow room for eggs. The cloacal opening (i.e., opening for digestive, urinary, and reproductive tracts) is also further back in males than in females (USGS 2006b). They typically reach sexual maturity when they are approximately 4 inches and four to six years of age (USGS 2006b).

The southwestern pond turtle is found in southern California, ranging from Monterey County south through Los Angeles, Riverside, and San Diego counties into northern Baja California, Mexico (USFWS 2023). It inhabits ponds, lakes, marshes, reservoirs, seasonal standing or slow-moving streams, canals, sloughs, vernal pools, and occasionally in brackish water (Germano and Bury 2001). Sufficient cover (e.g., vegetation, undercut banks) and basking sites are important components of suitable habitat (Spinks et al. 2003). Suitable basking sites include partially submerged logs, rocks, floating vegetation, and open mud banks (CDFW 2000). Adults are often observed basking on logs or other objects protruding out of the water or floating in the warmer surface water. They have both good hearing and eyesight and are easily disturbed; they are often heard splashing into the water to take cover before being seen (USGS 2006b). Their omnivorous diet primarily consists of aquatic invertebrates, but they also consume carrion, small fish, frogs, and plants (USGS 2006b).

Breeding typically occurs from April to May, although timing varies depending on location and seasonal conditions (Jennings and Hayes 1994). Females move from the water to adjacent upland habitats to lay eggs, usually sometime in late May to early July, although movement could occur as early as April or as late as August (Ernst et al. 1994). Nest site selection favors unshaded slopes that may be at least in part south-facing, likely to ensure that substrate temperatures will be high enough to incubate the eggs (Rathbun et al. 2002). The southwestern pond turtle can nest in a variety of soil conditions, but the soil must be at least 4 inches deep and have relatively high internal humidity (CDFW 2000). Clutch size varies from 1 to 13 eggs, positively correlated with body size; they can sometimes double-clutch (i.e., have more than one nest per year) (Goodman 1997a, 1997b; Lovich and Meyer 2002; Holland 1991, 1994; Hays et al. 1999; Pires 2001). Most hatchlings emerge in the early fall, while some may over-winter in the nest (Holland 1994).

Adults may remain active in the water year-round if conditions are suitable (i.e., enough water, warm temperatures) (USGS 2006b). Basking behavior may also be witnessed year-round due to warmer year-round temperatures (USGS 2006b). However, during the coldest months (i.e., October to April), this species will often seek upland refugia (i.e., shelter with appropriate temperature and moisture conditions) and enter a period of aestivation. Aestivation is a period of inactivity and decreased metabolic rate in response to seasonal temperature changes (similar to hibernation); it occurs more frequently in more temperate, high-elevation areas of the species' range (Holland and Goodman 1996). Terrestrial refugia are typically covered with dense leaf litter produced by a thick overstory of woody vegetation, such as in dense riparian thickets of willows (Rathbun et al. 2002). Southwestern pond turtles may choose sites where they can bask in direct sunlight or may bury themselves deep into leaf litter and duff (Rathbun et al. 2002). Winter refugia are often found in the same upland habitats as nesting sites. Southwestern pond turtles can also hibernate underwater in bottom mud (CDFW 2000).

The southwestern pond turtle faces several ongoing threats, including habitat loss, worsening drought conditions, and predation by invasive species. Urban development, especially for flood control, and agricultural expansion have led to significant habitat fragmentation and population declines (Spinks et al. 2003). Invasive, non-native plant species such as tamarisk (*Tamarix ramosissima*) and giant reed (*Arundo donax*) have altered stream morphology, reduced plant diversity, and eliminated basking sites (Lovich et al. 1994). The introduction of non-native turtle species, such as the red-eared slider (*Trachemys scripta elegans*) and western painted turtle (*Chrysemys picta bellii*), leads to competition for resources. These invasive turtles often have higher reproductive rates, which can result in them outcompeting the native southwestern pond turtle (Spinks et al. 2003; Lovich & Meyer 2002). As the southwestern pond turtle is the only native freshwater turtle in its historic range, it may lack competitive advantages against these invasive species. Additionally, the invasive American bullfrog (*Lithobates catesbeianus*) is a voracious predator that will eat any live animal it can swallow, and American bullfrog predation of hatchling and young western pond turtles has been recorded (Holland 1994). The intensity of American bullfrog predation is severe enough to eliminate recruitment in some southwestern pond turtle populations (Overtree and Collings 1997).

USGS (2004) conducted a Habitat Assessment and Baseline Surveys for the Western Spadefoot (*Spea hammondii*) and the Western Pond Turtle (*Emys marmorata*) on the Irvine Ranch Land Reserve. This survey effort included trapping of Irvine Lake for a total of 80 trap days[1] from September 29–October 3, 2003. No southwestern pond turtles were observed in Irvine Lake during this effort (USGS 2004).

SURVEY METHODS

Visual Survey

There is currently no standardized USFWS protocol in place for the southwestern pond turtle; therefore, surveys generally followed the Visual Survey Protocol for the Southcoast Ecoregion (USGS 2006a). Survey methods were focused on the detection of southwestern pond turtle adults and juveniles through visual observation; the visual surveys did not include dip netting or seining. Any southwestern pond turtles observed would have been documented and recorded using a Global Positioning System (GPS) or iPad to map the location on an aerial photograph.

Psomas Senior Biologist Jonathan Aguayo conducted visual surveys across all potentially suitable habitats for the southwestern pond turtle within the BSA. He walked slowly up the stream channel, either in the water or immediately adjacent to the water, visually searching for pond turtles with and without binoculars, concentrating on pools, surface water, banks, and suitable basking sites within the BSA. He searched aquatic habitat with and without binoculars for the presence of basking or underwater pond turtles. He observed open pools or possible basking areas from a distance and then approached slowly and quietly to help prevent disturbing basking turtles. He listened for the splash of water, which could indicate possible unseen turtles entering the water. If a splash was heard, he spent additional time observing the area for a turtle to resurface. Visual surveys were performed on August 20 and 30, 2024, during weather conditions favorable for turtle activity (Table 1).

[1] Trap days are the total number of traps used multiplied by the number of days the site was trapped. In this case, the site was trapped for four days using 20 traps for a total of 80 trap days.

The USGS (2006a) Visual Survey Protocol describes assessing habitat by stream segment in order to determine areas suitable for trapping. As all habitat along Santiago Creek and within Irvine Lake were considered suitable for southwestern pond turtle, and areas suitable for trapping had already been determined based on previous field surveys of the BSA, visual survey methods for the current survey did not include an assessment of habitat by stream segment.

TABLE 1
SUMMARY OF SURVEY CONDITIONS FOR THE
SOUTHWESTERN POND TURTLE VISUAL SURVEYS

Survey Number	Date	Time (Start/End)	Biologist	Weather Conditions		
				Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)

2	August 30, 2024	9:20 AM/3:40 PM	Aguayo	67/81	1/5	80/0

°F: Fahrenheit; mph: miles per hour; %: percent.

Turtle Trapping

Trapping surveys follow the methodology outlined in the Western Pond Turtle Trapping Survey Protocol for the Southcoast Ecoregion (USGS 2006b). A five-day/four-night trapping program was conducted in August 2024. Nylon mesh hoop traps and floating basking traps were placed in suitable locations in Irvine Lake, baited with cans of sardines in oil to attract turtles. Traps were set near habitat features likely to be used by pond turtles (possible basking areas, areas with underwater refugia). The hoop traps measured 2.5 feet in diameter by 6 feet long with 1-inch square mesh and featured a one-way funnel entrance. Floating basking traps measured 20 inches wide by 28 inches long and 13 inches deep, with two 13-inch wings. Both hoop and basking traps were equipped with floats and securely fastened to immovable objects to prevent submersion to allow for captured turtles (and other animals) to surface for air.

Traps were left in place for a maximum of 24 hours before being checked by Biologists to retrieve captured turtles and other aquatic species (e.g. fish, frogs, invertebrates). General weather data (i.e., ambient air temperature, sky conditions, wind speed) and water temperature were recorded at the start and end of each trapping session. Two trapping sessions, one on the west side of Irvine Lake and another on the east side of Irvine Lake, were required to adequately cover Irvine Lake. As described above, Santiago Creek was surveyed visually because it was not deep enough for trap placement.

Mr. Aguayo (Scientific Collecting Permit [SCP] ID: S-190310010-20076-001) and Senior Biologist Lindsay Messett (SCP ID: S-182810004-20009-001) were the Principal Investigators for the trapping sessions, with assistance from Psomas Biologists Trevor Bristle, Jack Underwood, Cristina Juran, and Tyler Glaser. Both Mr. Aguayo and Ms. Messett are knowledgeable about the southwestern pond turtle and hold the necessary CDFW authorization to trap and handle the species. All traps were tagged with Mr. Aguayo's CDFW SCP number, under which the live trapping was conducted.

Trapping sessions were conducted from August 19–23, 2024, on the west side of Irvine Lake and from August 26–30, 2024, on the east side of Irvine Lake. Surveys were conducted during weather conditions favorable for turtle activity (Tables 2 and 3). A total of 24 hoop traps and 3 basking traps were set in Irvine Lake. Trap locations were selected based on suitable habitat with traps spaced 820 feet (i.e., 250 meters) apart. The number of traps set was proportionate to the overall size of the lake. Trap locations were recorded with a GPS unit and mapped on an aerial photograph (Table 4, Exhibit 3).

SURVEY RESULTS

Habitat Description

Irvine Lake is a man-made reservoir with fluctuating water levels. The banks primarily consist of clay and silt. Riparian vegetation is present along the eastern and southeastern shoreline and is dominated by willows (*Salix* sp.) and mule fat (*Baccharis salicifolia* ssp. *salicifolia*) with emergent vegetation and aquatic plants present in shallow lake areas. Banks in these areas provide suitable upland nesting sites (e.g., sandy or loose soil) and basking opportunities (e.g., open mud banks). In contrast, the western side of the lake lacks emergent vegetation and riparian canopy cover. It provides limited upland habitat for nesting pond turtles due to steep cliffs and compacted soils from heavy foot traffic associated with recreational fishing. While large rocks, boulders, or logs are absent within the lake, some floating vegetation provides basking opportunities for turtles. Irvine Lake is regularly stocked with fish, and a significant number were observed during the surveys. The presence of non-native fish poses a threat to southwestern pond turtles by competing for food and preying on hatchlings.

Downstream of the dam, Santiago Creek consists of an alluvial wash with braided channels. The creek bed varies in width from 15 to 300 feet wide with substrate that consists primarily of sand and cobble. Topography is relatively flat, with low stream grade and flow velocity. During the surveys in late summer, the creek was almost entirely dry, with only a small amount of shallow water present in Fremont Canyon Creek, upstream of its confluence with Santiago Creek. No pools were present along Santiago Creek downstream of the dam during the surveys; therefore, there was no suitable basking habitat. Riparian vegetation downstream of Santiago Dam consists of sparse mule fat scrub scattered across a broad alluvial wash. Due to the limited water/pools, areas downstream of the dam along Santiago Creek would have limited potential to provide upland nesting habitat to turtles using Irvine Lake.

Upstream of the lake, Santiago Creek is a meandering perennial stream with braided channels. The creek varies in width from 15 to 650 feet wide with substrate that consists primarily of gravel, sand, and cobble, although some areas contain a mix of clay and silt. Topography is relatively flat, with low stream grade and flow velocity. Where the creek flows into Irvine Lake, stream morphology is characterized by shallow pools, slow-flowing water, and broad alluvial washes. Further upstream, Santiago Creek includes alternating sections of riffles, runs, and shallow pools (depths ranging from approximately one to three feet). These pools provide aquatic refugia with submerged vegetation and roots, and mats of algae. Riparian vegetation along Santiago Creek upstream of the lake is dominated by willows, mule fat, Fremont cottonwood (*Populus fremontii* ssp. *fremontii*), and western sycamore (*Platanus racemosa*). Multiple red-swamp crayfish (*Procambarus larkia*) and small non-native fish were observed during the survey. Red-swamp crayfish pose a threat to southwestern pond turtles by preying on their eggs and competing for food.

Visual Survey

No southwestern pond turtles were observed during the visual surveys.

Turtle Trapping

Over the course of the trapping effort, 108 trap days were completed (i.e., 27 traps multiplied by four days of trapping each). No southwestern pond turtles were captured during the trapping effort. Aquatic species captured during the trapping included 3 red-eared sliders, 3 channel catfish (*Ictalurus punctatus*), and 10 bluegill (*Lepomis macrochirus*) (Tables 5 and 6). Other species observed during the trapping included red-swamp crayfish, California treefrog (*Pseudacris cadaverina*), and Baja California treefrog (*Pseudacris hypochondriaca*).

Representative photographs of the turtle trapping effort and the species captured during the sessions are included in Attachment B. Survey data sheets are provided in Attachment C.

Subject: Results of Focused Presence/Absence Surveys for the Coastal California Gnatcatcher for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love:

This Letter Report presents the results of focused surveys for the coastal California gnatcatcher (*Polioptila californica californica*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "project site") located in Orange County, California. The purpose of the surveys was to determine the presence or absence of the coastal California gnatcatcher on or immediately adjacent to the project site. Surveys were conducted by a Biologist who holds the necessary Federal Endangered Species Act survey permit and were completed according to the guidelines established by the U.S. Fish and Wildlife Service (USFWS). Notification of the intent to conduct protocol-level surveys was submitted to the USFWS on April 8, 2020.

PROJECT LOCATION AND DESCRIPTION

The Irvine Ranch Water District (IRWD) and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Department of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the early design phase but would be located within the survey area provided by IRWD.

Santiago Creek Dam is located at the north end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. The project site is depicted on the U.S. Geological Survey's Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Topography in the center of the survey area is relatively flat, with rolling hills to the east and a steep cliff to the west. Elevations range from approximately 657 to 898 feet above mean sea level (msl). Santiago Creek, a blueline stream, occurs in the survey area. Surrounding land uses primarily consist of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. Residential development is located west of SR-241.

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Tel 714.751.7373
Fax 714.545.8883
www.Psomas.com

The project site is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. IRWD is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The following vegetation types and other areas occur within the project site: sagebrush scrub, disturbed sagebrush scrub, disturbed floodplain sage scrub, toyon – sumac chaparral, annual grassland, ruderal, southern willow scrub, mulefat scrub, coast live oak woodland, western sycamore, cliff, open water, ornamental, developed, and disturbed (Exhibit 3).

SURVEY AREA

The survey area for the gnatcatcher surveys includes all suitable habitat (i.e., sagebrush scrub, disturbed sagebrush scrub, and disturbed floodplain sagebrush scrub) on the project site and within a 500-foot buffer around the tentative impact footprint. The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (i.e., Irvine Lake) (Exhibit 4).

Specifically, coastal California gnatcatcher surveys were conducted in portions of the survey area that contained suitable sagebrush scrub habitat of appropriate size and stature. Sagebrush scrub habitats were distributed throughout the survey area and on the surrounding slopes. These habitat types were generally dominated by California sagebrush (*Artemisia californica*), leafy California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*), deerweed (*Acmispon glaber*), laurel sumac (*Malosma laurina*), lemonade berry (*Rhus integrifolia*), scaly scale-broom (*Lepidospartum squamatum*), toyon (*Heteromeles arbutifolia*), and California brickellbush (*Brickellia californica*). Openings between shrubs have native herbs, such as erect plantain (*Plantago erecta*) and narrow-toothed pectocarya (*Pectocarya linearis* ssp. *ferocula*) as well as non-native fennel (*Foeniculum vulgare*) and non-native grasses. Site photographs of representative habitat in the survey area are provided in Attachment A.

BACKGROUND

The coastal California gnatcatcher is a federally listed Threatened species and a California Species of Special Concern. This species occurs in most of Baja California, Mexico's arid regions, but this subspecies is extremely localized in the United States, where it predominantly occurs in coastal regions of highly urbanized Los Angeles, Orange, Riverside, and San Diego Counties (Atwood 1992). In California, this subspecies is a resident of coastal sage scrub vegetation types. The breeding season for the coastal California gnatcatcher ranges from late February to August. Nests are generally placed in a shrub about three feet above ground. Brood parasitism by brown-headed cowbirds (*Molothrus ater*) and loss of habitat to urban development have been cited as causes of coastal California gnatcatcher population decline (Unitt 1984; Atwood 1990).

Taxonomic studies indicate that the California gnatcatcher consists of four subspecies, which extend from southwestern California to southern Baja California, Mexico. The coastal California gnatcatcher, the northernmost gnatcatcher subspecies, is restricted to lowland areas from central Ventura County through Los Angeles, San Bernardino, Riverside, Orange, and San Diego Counties to the Baja California, Mexico, border (Atwood and Lerman 2006; Mellink and Rea 1994). The USFWS has rejected multiple petitions claiming that the coastal California gnatcatcher should be delisted because it is not a valid subspecies (USFWS 2011, 2016).

The coastal California gnatcatcher has been recorded from sea level to approximately 3,000 feet above msl (USFWS 2003); however, more than 90 percent of gnatcatcher records are from between sea level and 820 feet above msl along the coast and between sea level and 1,800 feet above msl inland (Atwood and Bolsinger 1992). USFWS estimates regarding the population size of the coastal California gnatcatcher in Southern California have been about 3,000 pairs (Atwood and Bontrager 2001). In the *5-Year Review: Summary and Evaluation* for the gnatcatcher, the USFWS cited a study estimating that there were approximately 1,324 gnatcatcher pairs over approximately 111,000 acres of public and quasi-public lands in Orange and San Diego Counties (Winchell and Doherty 2008). Because the Winchell and Doherty study covered only a portion of the U.S. range (focusing on the coast and limited to one year), this study cannot extrapolate beyond the sampling region; however, the USFWS states that it is likely more gnatcatchers are in the U.S. portion of the range than was suggested by earlier estimates (USFWS 2010).

The coastal California gnatcatcher typically occurs within coastal and inland sage scrub vegetation types, which often occur in a patchy distribution pattern throughout the gnatcatcher's range. Coastal California gnatcatchers also use chaparral, grassland, and riparian habitats that are in proximity to sage scrub for dispersal and foraging (Atwood et al. 1998; Campbell et al. 1998; USFWS 2003). Availability of these non-sage scrub areas is essential during certain times of the year, particularly during drought conditions or for dispersal, foraging, or nesting (USFWS 2003).

The USFWS published a Revised Final Rule designating Critical Habitat for the coastal California gnatcatcher in 2007 (USFWS 2007). This revised rule designates 197,303 acres of Critical Habitat in San Diego, Orange, Riverside, San Bernardino, Los Angeles, and Ventura Counties. The survey area is not located within the designated critical habitat for the coastal California gnatcatcher.

SURVEY METHODS

The USFWS's survey protocol for the coastal California gnatcatcher requires three visits, conducted at least one week apart, to all potentially occupied habitat areas for surveys within an NCCP area (USFWS 1997a, 1997b). All visits must be conducted between 6 AM and 12 PM, and no more than 100 acres of suitable habitat may be surveyed per visit. Psomas Senior Biologist Lindsay Messett (USFWS Permit No. TE 067064-3) conducted all focused surveys for coastal California gnatcatcher. Surveys were conducted on April 30, May 27, and June 25, 2020.

Ms. Messett avoided weather conditions that were too cold (i.e., below 55 degrees Fahrenheit [°F]), too hot (i.e., above 95°F), or too windy (i.e., wind speed greater than 15 miles per hour) to comply with USFWS survey protocol requirements. A summary of weather conditions during each survey is provided in Table 1, below. Ms. Messett conducted the surveys by slowly walking through all appropriate habitats while listening and watching for gnatcatcher activity and by using a combination of recordings of gnatcatcher vocalizations and "pishing" sounds to elicit responses from any gnatcatchers present. The frequency of vocalization playback and "pishing" varied depending on conditions such as habitat patch size, topography in each area, and ambient noise conditions. All wildlife species detected during the surveys were recorded (Attachment B).

TABLE 1
SUMMARY OF COASTAL CALIFORNIA GNATCATCHER SURVEYS

Survey Number	Date	Time (Start/End)	Surveyor	Weather Conditions			Gnatcatchers Observed and/or Detected
				Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)	
1	April 30, 2020	0715/1030	Messett	65/70	0–1/0–1	100/50	One male California gnatcatcher was observed
2	May 27, 2020	0815/1140	Messett	65/76	0–1/0–1	10/Clear	A pair of California gnatcatchers was observed incubating a nest
3	June 25, 2020	0650/1000	Messett	68/77	0–1/0–1	90/40	A family group of California gnatcatchers (pair and three fledglings) was observed foraging together

°F: degrees Fahrenheit; mph: miles per hour; %: percent.

SURVEY RESULTS

One California gnatcatcher territory was observed in the survey area (Exhibit 4). A male California gnatcatcher was observed foraging alone in sagebrush scrub located central portion of the survey area during the first survey on April 30, 2020. It briefly responded to recorded playback and continued to forage in the northwestern portion of the survey area. On the second survey, a pair was observed in the northwestern portion of the survey area. During this second survey, a female California gnatcatcher was initially observed foraging alone in the northwest corner of the survey area. Ms. Messett followed the female and after approximately 30 minutes, she observed a nest exchange with the female entering and the male exiting a large scalebroom (*Lepidospartum squamatum*) shrub located just outside of the northern project site boundary. Both the male and female were observed incubating the nest. During the third survey on June 25, 2020, Ms. Messett observed a family group with at least three fledglings foraging together in sagebrush scrub, south of the nest location. The recent fledglings were observed displaying food begging behavior while the adults were observed feeding them. During subsequent focused surveys for least Bell's vireo, the pair was observed foraging in the northwestern portion of the survey area and a juvenile was observed foraging alone in the central portion of the survey area.

OTHER OBSERVATIONS

Two other special status species were observed and/or detected in the survey area during the surveys: southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*) and coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*) (Exhibit 4). Southern California rufous-crowned sparrow is a California Department of Fish and Wildlife (CDFW) Watch List species and the coastal cactus wren is a California Species of Special Concern. These species are tracked by the CDFW's California Natural Diversity Database (CNDDB). CNDDB forms are included in Attachment C and will be submitted online by Ms. Messett.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Lindsay Messett (Lindsay.Messett@psomas.com).

Sincerely,
PSOMAS

WILDLIFE COMPENDIUM

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Species	
Scientific Name	**Common Name**
BIRDS	
ANATIDAE - SWAN, GOOSE, AND DUCK FAMILY	
Branta canadensis	Canada goose
ODONTOPHORIDAE - NEW WORLD QUAIL FAMILY	
Callipepla californica	California quail
COLUMBIDAE - PIGEON AND DOVE FAMILY	
*Columba livia**	rock pigeon
Zenaida macroura	mourning dove
CUCULIDAE - CUCKOO AND ROADRUNNER FAMILY	
Geococcyx californianus	greater roadrunner
CAPRIMULGIDAE - NIGHTJAR FAMILY	
Chordeiles acutipennis	lesser nighthawk
TROCHILIDAE - HUMMINGBIRD FAMILY	
Calypte anna	Anna's hummingbird
Selasphorus rufus	rufous hummingbird
CATHARTIDAE - NEW WORLD VULTURE FAMILY	
Cathartes aura	turkey vulture
ACCIPITRIDAE - HAWK FAMILY	
Buteo jamaicensis	red-tailed hawk
STRIGIDAE - TYPICAL OWL FAMILY	
Megascops kennicottii	western screech-owl
Bubo virginianus	great horned owl
PICIDAE - WOODPECKER FAMILY	
Melanerpes formicivorus	acorn woodpecker
PSITTACIDAE - PARROT FAMILY	
*Amazona viridigenalis**	red-crowned parrot*
TYRANNIDAE - TYRANT FLYCATCHER FAMILY	
Myiarchus cinerascens	ash-throated flycatcher
Tyrannus vociferans	Cassin's kingbird
VIREONIDAE - VIREO FAMILY	
Vireo gilvus	warbling vireo
CORVIDAE - JAY AND CROW FAMILY	
Aphelocoma californica	California scrub-jay
Corvus brachyrhynchos	American crow
HIRUNDINIDAE - SWALLOW FAMILY	
Petrochelidon pyrrhonota	cliff swallow
Hirundo rustica	barn swallow
AEGITHALIDAE - BUSHTIT FAMILY	
Psaltriparus minimus	bushtit
TROGLODYTIDAE - WREN FAMILY	
Troglodytes aedon	house wren
Thryomanes bewickii	Bewick's wren
Campylorhynchus brunneicapillus sandiegensis	coastal cactus wren

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Species	
Scientific Name	**Common Name**
POLIOPTILIDAE - GNATCATCHER FAMILY	
Polioptila caerulea	blue-gray gnatcatcher
Polioptila californica	California gnatcatcher
SYLVIIDAE - SILVIID WARBLERS FAMILY	
Chamaea fasciata	wrentit
MIMIDAE - MOCKINGBIRD AND THRASHER FAMILY	
Toxostoma redivivum	California thrasher
Mimus polyglottos	northern mockingbird
STURNIDAE - STARLING FAMILY	
*Sturnus vulgaris**	European starling*
FRINGILLIDAE - FINCH FAMILY	
Haemorhous mexicanus	house finch
Spinus psaltria	lesser goldfinch
PASSERELLIDAE - NEW WORLD SPARROW FAMILY	
Pipilo maculatus	spotted towhee
Aimophila ruficeps	rufous-crowned sparrow
Melozone crissalis	California towhee
Melospiza melodia	song sparrow
ICTERIDAE - BLACKBIRDS AND ORIOLES	
Icterus cucullatus	hooded oriole
PARULIDAE - WOOD-WARBLER FAMILY	
Geothlypis trichas	common yellowthroat
Cardellina pusilla	Wilson's warbler
CARDINALIDAE - CARDINALS AND ALLIES	
Piranga ludoviciana	western tanager
Pheucticus melanocephalus	black-headed grosbeak
MAMMALS	
SCIURIDAE - SQUIRREL FAMILY	
Otospermophilus beecheyi	California ground squirrel
LEPORIDAE - HARE AND RABBIT FAMILY	
Sylvilagus audubonii	desert cottontail
* Non-native

ANIMAL INFORMATION

How was the detection made? Heard calling then seen

Number detected in each age class:

adults	juveniles	larvae	egg mass	unknown
2	3			

Age class comment: Observed the pair incubating on a nest, then later they were observed traveling with recent fledglings and later one juvenile was incidentally observed (assumed to be disbursed from the same family group)

Bird site use:

☑ **Nesting** ☐ **Rookery** ☐ **Nesting colony** ☐ **Burrow site** ☐ **Lek**

☐ **Non-breeding (over-wintering)** ☐ **Communal roost** ☐ **Other**

Site use description: Used for nesting and foraging

What was the observed behavior? Observed male foraging alone. Observed female foraging alone then observed a nest exchange with the male. Later I observed the pair feeding recent fledglings. During a different survey i also incidentally observed a juvenile foraging alone.

Describe any evidence of reproduction: Observed a nest, as well as fledglings and a juvenile

Subject: Results of Focused Presence/Absence Surveys for the Coastal California Gnatcatcher for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love and Mr. Mayer:

This Letter Report presents the results of focused surveys for the coastal California gnatcatcher (*Polioptila californica californica*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "project site") located in Orange County, California. The purpose of the surveys was to determine the presence or absence of the coastal California gnatcatcher upstream of Santiago Dam. Focused surveys were conducted downstream of Santiago Dam in Spring 2020 (Psomas 2020). Surveys were conducted by a Biologist who holds the necessary Federal Endangered Species Act survey permit and were completed according to the guidelines established by the U.S. Fish and Wildlife Service (USFWS). Notification of the intent to conduct protocol-level surveys was submitted to the USFWS on March 8, 2022.

PROJECT LOCATION AND DESCRIPTION

The project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

The project site is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Tel 714.751.7373
Fax 714.545.8883
www.Psomas.com

while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the project site in the northwest, downstream of the Dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the project site. Elevations in the project site range from approximately 657 to 996 feet above mean sea level (msl).

The project site is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD)[1] is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The IRWD and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Division of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the design phase but would be located within the survey area provided by IRWD.

SURVEY AREA

A variety of vegetation types occur on the project site, including sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, western sycamore, and vegetated fluctuating shoreline. Other landcover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas (Exhibit 3).

The survey area for the gnatcatcher surveys includes all suitable habitat (i.e., sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, and disturbed floodplain sagebrush scrub) upstream of the Dam on the project site. The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (i.e., Irvine Lake) (Exhibit 4).

Specifically, coastal California gnatcatcher surveys were conducted in portions of the survey area that contained suitable sagebrush scrub habitat of appropriate size and stature. Sagebrush scrub habitats were distributed throughout the survey area and on the surrounding slopes. These habitat types were generally dominated by California sagebrush (*Artemisia californica*), leafy California buckwheat (*Eriogonum fasciculatum* var. *foliolosum*), deerweed (*Acmispon glaber*), laurel sumac (*Malosma laurina*), lemonade berry (*Rhus integrifolia*), and toyon (*Heteromeles arbutifolia*). Openings between shrubs have native herbs, such as erect plantain (*Plantago erecta*) and narrow-toothed pectocarya (*Pectocarya linearis* ssp.

[1] The Santiago County Water District (SCWD) was also a participating jurisdiction in the NCCP/HCP. The SCWD consolidated with IRWD in 2006.

ferocula) as well as non-native fennel (*Foeniculum vulgare*) and non-native grasses. Site photographs of representative habitat in the survey area are provided in Attachment A.

BACKGROUND

The coastal California gnatcatcher is a federally listed Threatened species and a California Species of Special Concern. This species occurs in most of Baja California, Mexico's arid regions, but this subspecies is extremely localized in the United States, where it predominantly occurs in coastal regions of highly urbanized Los Angeles, Orange, Riverside, and San Diego Counties (Atwood 1992). In California, this subspecies is a resident of coastal sage scrub vegetation types. The breeding season for the coastal California gnatcatcher ranges from late February to August. Nests are generally placed in a shrub about three feet above ground. Brood parasitism by brown-headed cowbirds (*Molothrus ater*) and loss of habitat to urban development have been cited as causes of coastal California gnatcatcher population decline (Unitt 1984; Atwood 1990).

Taxonomic studies indicate that the California gnatcatcher consists of four subspecies, which extend from southwestern California to southern Baja California, Mexico. The coastal California gnatcatcher, the northernmost gnatcatcher subspecies, is restricted to lowland areas from central Ventura County through Los Angeles, San Bernardino, Riverside, Orange, and San Diego Counties to the Baja California, Mexico, border (Atwood and Lerman 2006; Mellink and Rea 1994). The USFWS has rejected multiple petitions claiming that the coastal California gnatcatcher should be delisted because it is not a valid subspecies (USFWS 2011, 2016).

The coastal California gnatcatcher has been recorded from sea level to approximately 3,000 feet above msl (USFWS 2003); however, more than 90 percent of gnatcatcher records are from between sea level and 820 feet above msl along the coast and between sea level and 1,800 feet above msl inland (Atwood and Bolsinger 1992). USFWS estimates regarding the population size of the coastal California gnatcatcher in Southern California have been about 3,000 pairs (Atwood and Bontrager 2001). In the 2010 *5-Year Review: Summary and Evaluation* for the gnatcatcher, the USFWS cited a study estimating that there were approximately 1,324 gnatcatcher pairs over approximately 111,000 acres of public and quasi-public lands in Orange and San Diego Counties (Winchell and Doherty 2008). Because the Winchell and Doherty study covered only a portion of the U.S. range (focusing on the coast and limited to one year), this study cannot extrapolate beyond the sampling region; however, the USFWS states that it is likely more gnatcatchers are in the U.S. portion of the range than was suggested by earlier estimates (USFWS 2010). The most recent *5-Year Review* concluded that the threats affecting the species have not changed and that the coastal California gnatcatcher should remain a Threatened species (USFWS 2020).

The coastal California gnatcatcher typically occurs within coastal and inland sage scrub vegetation types, which often occur in a patchy distribution pattern throughout the gnatcatcher's range. Coastal California gnatcatchers also use chaparral, grassland, and riparian habitats that are in proximity to sage scrub for dispersal and foraging (Atwood et al. 1998; Campbell et al. 1998; USFWS 2003). Availability of these non-sage scrub areas is essential during certain times of the year, particularly during drought conditions or for dispersal, foraging, or nesting (USFWS 2003).

The USFWS published a Revised Final Rule designating Critical Habitat for the coastal California gnatcatcher in 2007 (USFWS 2007). This revised rule designates 197,303 acres of Critical Habitat in San Diego, Orange, Riverside, San Bernardino, Los Angeles, and Ventura Counties. The survey area is not located within the designated critical habitat for the coastal California gnatcatcher.

SURVEY METHODS

The USFWS's survey protocol for the coastal California gnatcatcher requires three visits, conducted at least one week apart, to all potentially occupied habitat areas for surveys within an NCCP area (USFWS 1997a, 1997b). All visits must be conducted between 6 AM and 12 PM, and no more than 100 acres of suitable habitat may be surveyed per visit. Psomas Senior Biologist Lindsay Messett (USFWS Permit No. TE 067064-5) conducted all focused surveys for coastal California gnatcatcher. Surveys were conducted on March 25, April 4, and June 9, 2022.

Ms. Messett avoided weather conditions that were too cold (i.e., below 55 degrees Fahrenheit [°F]), too hot (i.e., above 95°F), or too windy (i.e., wind speed greater than 15 miles per hour) to comply with USFWS survey protocol requirements. A summary of weather conditions during each survey is provided in Table 1, below. Ms. Messett conducted the surveys by slowly walking through all appropriate habitats while listening and watching for gnatcatcher activity and by using a combination of recordings of gnatcatcher vocalizations and "pishing" sounds to elicit responses from any gnatcatchers present. The frequency of vocalization playback and "pishing" varied depending on conditions such as habitat patch size, topography in each area, and ambient noise conditions. All wildlife species detected during the surveys were recorded (Attachment B).

TABLE 1
SUMMARY OF COASTAL CALIFORNIA GNATCATCHER SURVEYS

Survey Number	Date	Time (Start/End)	Surveyor	Weather Conditions			Gnatcatchers Observed and/or Detected
				Temperature (°F) (Start/End)	Wind (mph) (Start/End)	Cloud Cover (%) (Start/End)	
1	March 25, 2022	0700/1300	Messett	55/83	0–1/1–2	100/Clear	One California gnatcatcher was detected through vocalization
2	April 14, 2022	0730/1200	Messett	55/69	0–1/4–5	Clear/20	No California gnatcatchers were observed/detected
3	June 9, 2022	0700/1155	Messett	62/76	1–2/3–4	100/Clear	No California gnatcatchers were observed/detected

°F: degrees Fahrenheit; mph: miles per hour; %: percent.

SURVEY RESULTS

One coastal California gnatcatcher was detected just outside the northern portion of the survey area during the first focused survey on March 25, 2022 (Exhibit 4). It briefly responded to recorded playback and continued moving northeast of the survey area. This individual was detected through vocalization and not directly observed; therefore, the sex and breeding status was undetermined. No additional California gnatcatchers were observed or detected during the remaining focused surveys.

OTHER OBSERVATIONS

Eight other special status species were observed and/or detected in the survey area during the surveys: American white pelican (*Pelecanus erythrorhynchos*, California Species of Special Concern), bald eagle (*Haliaeetus leucocephalus*, State Endangered, California Fully Protected), least Bell's vireo (*Vireo bellii pusillus*, State Endangered, Federally Endangered), coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*, California Species of Special Concern), grasshopper sparrow (*Ammodramus savannarum*, California Species of Special Concern), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*, a California Department of Fish and Wildlife [CDFW] Watch List), yellow-breasted chat (*Icteria virens*, California Species of Special Concern), and yellow warbler (*Setophaga petechia*, California Species of Special Concern) (Exhibit 4). These species are tracked by the CDFW's California Natural Diversity Database (CNDDB). The least Bell's vireo, yellow-breasted chat, and yellow warbler were all observed within riparian habitat; exhibits showing the location of these species and CNDDB forms documenting these species will be included with the Results of Focused Presence/Absence Surveys for the Least Bell's Vireo and Southwestern Willow Flycatcher Report (Psomas 2022 [in preparation]). CNDDB forms for the remaining species are included in Attachment C and will be submitted online by Ms. Messett.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Lindsay Messett (Lindsay.Messett@psomas.com).

WILDLIFE COMPENDIUM

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Scientific Name	Common Name	Special Status
SNAKES		
COLUBRIDAE – COLUBRID SNAKE FAMILY		
Pituophis catenifer	gopher snake	
BIRDS		
ANATIDAE – SWAN, GOOSE, AND DUCK FAMILY		
Branta canadensis	Canada goose	
Anas platyrhynchos	mallard	
ODONTOPHORIDAE – NEW WORLD QUAIL FAMILY		
Callipepla californica	California quail	
PODICIPEDIDAE – GREBE FAMILY		
Aechmophorus occidentalis	western grebe	
COLUMBIDAE – PIGEON AND DOVE FAMILY		
Zenaida macroura	mourning dove	
CUCULIDAE – CUCKOO AND ROADRUNNER		
Geococcyx californianus	greater roadrunner	
TROCHILIDAE – HUMMINGBIRD FAMILY		
Calypte anna	Anna's hummingbird	
Selasphorus sasin	Allen's hummingbird	
RALLIDAE – RAIL AND COOT FAMILY		
Fulica americana	American coot	
CHARADRIIDAE – PLOVER FAMILY		
Charadrius vociferus	killdeer	
LARIDAE – GULL AND TERN FAMILY		
Thalasseus elegans	elegant tern	
PHALACROCORACIDAE – CORMORANT FAMILY		
Phalacrocorax auritus	double-crested cormorant	
PELECANIDAE – PELICAN FAMILY		
Pelecanus erythrorhynchos	American white pelican	SSC
ARDEIDAE – HERON FAMILY		
Ardea alba	great egret	
CATHARTIDAE – NEW WORLD VULTURE FAMILY		
Cathartes aura	turkey vulture	
ACCIPITRIDAE – HAWK FAMILY		
Haliaeetus leucocephalus	bald eagle	SE, FP
Buteo lineatus	red-shouldered hawk	
Buteo jamaicensis	red-tailed hawk	
PICIDAE – WOODPECKER FAMILY		
Melanerpes formicivorus	acorn woodpecker	
Picoides nuttallii	Nuttall's woodpecker	
FALCONIDAE – FALCON FAMILY		
Falco sparverius	American kestrel	
TYRANNIDAE – TYRANT FLYCATCHER FAMILY		
Empidonax difficilis	Pacific-slope flycatcher	
Sayornis saya	Say's phoebe	

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Scientific Name	Common Name	Special Status
Myiarchus cinerascens	ash-throated flycatcher	
Tyrannus vociferans	Cassin's kingbird	
VIREONIDAE – VIREO FAMILY		
Vireo bellii pusillus	least Bell's vireo	FE, SE
CORVIDAE – JAY AND CROW FAMILY		
Aphelocoma californica	California scrub-jay	
Corvus corax	common raven	
ALAUDIDAE – LARK FAMILY		
Eremophila alpestris actia	California horned lark	
HIRUNDINIDAE – SWALLOW FAMILY		
Hirundo rustica	barn swallow	
Petrochelidon pyrrhonota	cliff swallow	
AEGITHALIDAE – BUSHTIT FAMILY		
Psaltriparus minimus	bushtit	
TROGLODYTIDAE – WREN FAMILY		
Troglodytes aedon	house wren	
Thryomanes bewickii	Bewick's wren	
Campylorhynchus brunneicapillus sandiegensis	coastal cactus wren	SSC
POLIOPTILIDAE – GNATCATCHER FAMILY		
Polioptila caerulea	blue-gray gnatcatcher	
Polioptila californica	California gnatcatcher	FT, SSC
SYLVIIDAE – SILVIID WARBLERS FAMILY		
Chamaea fasciata	wrentit	
TURDIDAE – THRUSH FAMILY		
Sialia mexicana	western bluebird	
MIMIDAE – MOCKINGBIRD AND THRASHER FAMILY		
Toxostoma redivivum	California thrasher	
Mimus polyglottos	northern mockingbird	
STURNIDAE – STARLING FAMILY		
*Sturnus vulgaris**	European starling*	
FRINGILLIDAE – FINCH FAMILY		
Haemorhous mexicanus	house finch	
Spinus psaltria	lesser goldfinch	
Spinus lawrencei	Lawrence's goldfinch	
PASSERELLIDAE – NEW WORLD SPARROW FAMILY		
Ammodramus savannarum	grasshopper sparrow	SSC
Zonotrichia leucophrys	white-crowned sparrow	
Melospiza melodia	song sparrow	
Melozone crissalis	California towhee	
Aimophila ruficeps	rufous-crowned sparrow	
Pipilo maculatus	spotted towhee	

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Scientific Name	Common Name	Special Status
ICTERIIDAE – YELLOW-BREASTED CHAT FAMILY		
Icteria virens	yellow-breasted chat	SSC
ICTERIDAE – BLACKBIRDS AND ORIOLES		
Sturnella neglecta	western meadowlark	
Icterus cucullatus	hooded oriole	
Agelaius phoeniceus	red-winged blackbird	
PARULIDAE – WOOD-WARBLER FAMILY		
Geothlypis trichas	common yellowthroat	
Setophaga petechia	yellow warbler	SSC
Setophaga coronata	yellow-rumped warbler	
CARDINALIDAE – CARDINALS AND ALLIES		
Pheucticus melanocephalus	black-headed grosbeak	
Passerina caerulea	blue grosbeak	
Passerina amoena	lazuli bunting	
MAMMALS		
SCIURIDAE – SQUIRREL FAMILY		
Otospermophilus beecheyi	California ground squirrel	
GEOMYIDAE – POCKET GOPHER FAMILY		
Thomomys bottae	Botta's pocket gopher	
LEPORIDAE – HARE AND RABBIT FAMILY		
Sylvilagus audubonii	desert cottontail	
CANIDAE – CANID FAMILY		
Canis latrans	coyote	
CERVIDAE – CERVID FAMILY		
Odocoileus hemionus	southern mule deer

Subject: Results of Focused Presence/Absence Surveys for the Least Bell's Vireo for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love and Ms. Beck:

This Letter Report presents the results of focused surveys for the least Bell's vireo (*Vireo bellii pusillus*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "project site") located in Orange County, California. The purpose of the surveys was to determine the presence or absence of the least Bell's vireo on or immediately adjacent to the project site. Surveys were conducted by a Biologist with the necessary experience and were completed according to the guidelines established by the U.S. Fish and Wildlife Service (USFWS). Notification of the intent to conduct protocol-level surveys was submitted to California Department of Fish and Wildlife (CDFW) on April 8, 2020.

PROJECT LOCATION AND DESCRIPTION

The Irvine Ranch Water District (IRWD) and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Department of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the early design phase but would be located within the project site provided by IRWD.

Santiago Creek Dam is located at the north end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). It is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. The project site is depicted on the U.S. Geological Survey's Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Topography in the center of the survey area is relatively flat, with rolling hills to the east and a steep cliff to the west. Elevations range from approximately 657 to 898 feet above mean sea level (msl). Santiago Creek, a blueline stream,

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Tel 714.751.7373
Fax 714.545.8883
www.Psomas.com

occurs in the survey area. Surrounding land uses primarily consist of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. Residential development is located west of SR-241.

The project site is located in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. IRWD is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The following vegetation types and other areas occur within the project site: sagebrush scrub, disturbed sagebrush scrub, disturbed floodplain sage scrub, toyon – sumac chaparral, annual grassland, ruderal, southern willow scrub, mulefat scrub, coast live oak woodland, western sycamore, cliff, open water, ornamental, developed, and disturbed (Exhibit 3).

SURVEY AREA

The survey area for the least Bell's vireo surveys includes all suitable habitat (i.e., southern willow scrub and mule fat scrub) on the project site and within a 500-foot buffer north of the project site along Santiago Creek. The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (i.e., Irvine Lake) (Exhibit 4).

Specifically, least Bell's vireo surveys were conducted in portions of the survey area that contained suitable riparian habitat of appropriate size and stature. Riparian habitats occur along Santiago Creek downstream from the existing spillway and within the low flow channel of the creek. These habitat types were generally dominated by arroyo willow (*Salix lasiolepis*) and mule fat (*Baccharis salicifolia* ssp. *salicifolia*), with scattered white alder (*Alnus rhombifolia*), western sycamore (*Platanus racemosa*), and Fremont cottonwood (*Populus fremontii* ssp. *fremontii*). California sagebrush (*Artemisia californica*), flatsedge (*Cyperus* sp.), non-native fennel (*Foeniculum vulgare*), mustards (*Hirschfeldia* spp. and *Brassica* spp.), and non-native grasses (*Avena* spp. and *Bromus* spp.) also occur in these areas. Additionally, a depression in the streambed holds standing water surrounded by cattails (*Typha* sp.). Site photographs of representative habitat in the survey area are provided in Attachment A.

SPECIES BACKGROUND

Least Bell's Vireo

Least Bell's vireo is a federally and State listed Endangered species. It is one of four subspecies of the Bell's vireo (*Vireo bellii*); this subspecies is the westernmost of the four subspecies, breeding entirely in southwestern California and northwestern Baja California, Mexico. Although not well known, the winter range of the least Bell's vireo is believed to be the west coast of Central America from southern Sonora, Mexico, south to northwestern Nicaragua, including the cape region of Baja California, Mexico (Brown 1993). The least Bell's vireo arrives in southern California from mid-March to early April and departs for its wintering grounds in August to mid-September.

The least Bell's vireo is a small, gray migratory songbird that is about 4.5 to 5 inches long. It has short, rounded wings and a short, straight bill for catching insects. Feathers are gray above and pale below. "The least Bell's vireo is easily recognized on the breeding grounds by its distinctive song" (Coues 1903).

Males establish and defend territories through counter-singing, chasing, and sometimes physically confronting neighboring males (USFWS 1998).

Least Bell's vireos consume a "wide variety of insects including bugs, beetles, grasshoppers, moths, and particularly caterpillars" (Chapin 1925; Bent 1950). They obtain prey through foliage gleaning (i.e., picking prey from leaves or bark) and through hovering (i.e., removing prey from vegetation surfaces while fluttering in the air) (Salata 1983; Miner 1989). Vireos will forage in all layers of the canopy but tend to concentrate their foraging in the lower to mid-strata from 9 to 18 feet in height (Miner 1989). Vireos forage in both riparian and adjacent upland habitat (Salata 1983; Kus and Miner 1987).

The least Bell's vireo is an obligate riparian species (i.e., nests exclusively in riparian habitat) and prefers early-successional habitat. On its breeding grounds, it typically inhabits structurally diverse woodlands along watercourses. In California, least Bell's vireo habitat consists of southern willow scrub, mule fat scrub, sycamore alluvial woodland, coast live oak riparian forest, arroyo willow riparian forest, and cottonwood bottomland forest (Faber et al. 1989). Although least Bell's vireos typically nest in willow-dominated areas, plant species composition does not appear to be as important in nest site selection as habitat structure (USFWS 1998). The most critical factor in habitat structure is the presence of a dense understory shrub layer from approximately 3 to 6 feet above ground, where nests are typically placed, and a dense stratified canopy for foraging (Goldwasser 1981; Gray and Greaves 1981; Salata 1981, 1983; RECON 1989). This structure is typically met by willows that are between four and ten years of age (RECON 1988; Franzreb 1989). As stands mature, the tall canopy tends to shade out the shrub layer, making the sites less suitable for nesting; however, least Bell's vireos will continue to use such areas if patches of understory exist (USFWS 1998). Vireo nest placement tends to occur in openings and along the riparian edge, where exposure to sunlight allows the development of shrubs (USFWS 1998). The riparian ecosystems required by the vireo are dynamic systems; and the scouring of vegetation during periodic floods is required to create the low, dense vegetation favored by the bird (USFWS 1986).

Males arrive on the breeding grounds about one week prior to females, and older birds arrive before first-year birds. Pair formation occurs within a few days, and pairs build a nest together over the next four to five days. The typical clutch size for least Bell's vireo is four eggs, which are incubated for approximately 14 days. The young remain in the nest for approximately 10 to 12 days. Adults continue to care for the young for at least two weeks post-fledging, as the family groups forage over larger areas. The largest causes of least Bell's vireo nest failure are nest parasitism by brown-headed cowbird (*Molothrus ater*) and egg predation; nests also fail due to vegetation clearing, trampling by humans and cattle, ant infestations, and rainstorms. Least Bell's vireo will make up to five nesting attempts per season, assuming adequate energy resources; typically, a pair will successfully fledge young from one to two nests per season. Few nests are initiated after mid-July (USFWS 1998). The least Bell's vireo often shows a strong site fidelity, returning not just to the same drainage and the same territory but even to the same tree where it previously nested. However, vireos may move locations due to habitat loss or failure to attract a mate (USFWS 1998).

The least Bell's vireo was formerly considered a common breeder in riparian habitats throughout the Central Valley and other low-elevation riverine systems throughout California and Baja California, Mexico (USFWS 1998). At the time of its listing, the least Bell's vireo had been eliminated from 95 percent of its former range (USFWS 1986). The decline of least Bell's vireo is attributed to the widespread loss of riparian woodlands coupled with the increase in brown-headed cowbirds (USFWS 1986). Loss of riparian habitat has been attributed to flood control and water development projects, agricultural development, livestock grazing, spread of invasive exotic plant species, degradation of habitat by off-road vehicles, and urban development. With the implementation of intensive brown-headed cowbird management programs, the least Bell's vireo numbers have dramatically increased (USFWS 1998). Vireos have also expanded their range into areas where they were formerly extirpated.

On February 2, 1994, the USFWS issued their final determination of Critical Habitat for the least Bell's vireo, identifying approximately 37,560 acres as Critical Habitat in Santa Barbara, Ventura, Los Angeles, San Bernardino, Riverside, and San Diego Counties (USFWS 1994). The project site is not located in designated Critical Habitat for this species.

SURVEY METHODS

The USFWS protocol for the least Bell's vireo requires that at least eight surveys be conducted from April 10 to July 31 with a ten-day interval between each site visit (USFWS 2001). Psomas Senior Biologist Lindsay Messett conducted all focused surveys for least Bell's vireo. Surveys were conducted on April 30, May 12 and 27, June 9, and 25, and July 6, 17, and 28, 2020.

Ms. Messett systematically surveyed the riparian habitats by walking slowly and methodically along their margins; habitat is narrow enough that transects through the habitat were not necessary. As the least Bell's vireo survey protocol does not require the playback of least Bell's vireo vocalizations, recorded least Bell's vireo vocalizations were not used during the surveys. Any least Bell's vireos detected were recorded with a Global Positioning System (GPS) unit (Garmin Vista) or an iPad. Although not required during a presence/absence survey, time was also taken to visually observe any individuals detected to identify their sex and age to determine the fate of the territory over the course of the surveys (e.g., juveniles observed indicate successful nesting).

All surveys were conducted under optimal weather conditions and during early morning hours when bird activity is at its peak (Table 1). It should be noted that the timing of a few of the surveys began later because on these mornings, Ms. Messett was surveying for coastal California gnatcatcher (*Polioptila californica californica*) in the adjacent upland habitat. If a least Bell's vireo was singing during the gnatcatcher survey, Ms. Messett likely would have heard it in the adjacent riparian habitat. All bird species detected during the survey were recorded, including notable observations of special status species or other birds (e.g., brown-headed cowbird). A complete list of wildlife species observed during the surveys is included in Attachment B.

TABLE 1
SUMMARY OF SURVEY DATA AND CONDITIONS FOR
LEAST BELL'S VIREO SURVEYS

Survey Dates	Surveyors	Time	Air Temperature (°F) (Start/End)		Cloud Cover (Start/End)	Wind (mph) (Start/End)
April 30	Messett	10:00 AM – 11:30 AM	71	75	50/Clear	0–1/0–1
May 12	Messett	7:30 AM – 11:00 AM	61	69	10/80	0–1/0–1
May 27	Messett	6:30 AM – 8:15 AM	65	76	10/Clear	0–1/0–2
June 9	Messett	6:50 AM – 10:45 AM	70	91	Clear/Clear	0–1/1–2
June 25	Messett	10:00 AM – 11:40 AM	68	77	90/40	0–1/0–1
July 6	Messett	6:45 AM – 10:30 AM	68	83	10/Clear	0–1/1–3
July 17	Messett	7:00 AM – 10:10 AM	67	74	100/Clear	0–1/0–1
July 28	Messett	6:40 AM – 10:25 AM	65	70	Clear/Clear	0–1/1–2

SURVEY RESULTS

Least Bell's Vireo

No least Bell's vireo were observed in the survey area over the course of the surveys.

Following completion of the survey on July 17, 2020, Ms. Messett was incidentally observed a male least Bell's vireo when she was opening the gate to leave through Irvine Regional Park. The gate and vireo observation are located approximately one-mile northwest of the survey area. The male vireo was observed singing continuously (indicating that he was likely not paired) and foraging within a coast live oak (*Quercus agrifolia*) just within the boundary of Irvine Regional Park. A California Natural Diversity Database (CNDDB) form will be submitted online by Ms. Messett but one is not included in this report because of the distance from the survey area.

The required Least Bell's Vireo Survey Data Summary Form is included in Attachment C. The incidental vireo observation is not included in this form because of its distance from the survey area. Additionally, the area of the incidental observation was not systematically surveyed so it is unknown if this male was a transient male or if he maintained a territory over the breeding season.

Other Observations

Two sensitive species were observed and/or detected in the survey area during the surveys: coastal California gnatcatcher and coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*). The coastal California gnatcatcher is a federally listed Threatened species and a California Species of Special Concern. The coastal cactus wren is a California Species of Special Concern. Both species were observed and/or detected during multiple surveys. CNDDB forms documenting these species will be submitted online by Ms. Messett and are included with the Results of Coastal California Gnatcatcher Survey Report (Psomas 2020).

Brown-headed cowbirds were not observed in the survey area during the surveys.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Lindsay Messett (Lindsay.Messett@psomas.com).

Subject: Results of Focused Presence/Absence Surveys for the Least Bell's Vireo and Southwestern Willow Flycatcher for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project, Orange County, California

Dear Ms. Love and Mr. Mayer:

This Letter Report presents the results of focused surveys for the least Bell's vireo (*Vireo bellii pusillus*) and southwestern willow flycatcher (*Empidonax traillii extimus*) for the Santiago Creek Dam Outlet Tower and Spillway Improvement Project (hereinafter referred to as the "project site") located in Orange County, California. The purpose of the surveys was to determine the presence or absence of the least Bell's vireo and southwestern willow flycatcher upstream of Santiago Dam. Focused surveys for least Bell's vireo were conducted downstream of Santiago Dam in Spring 2020 (Psomas 2020). A Biologist with the necessary experience and the Federal Endangered Species Act 10(a) survey permit conducted the surveys according to U.S. Fish and Wildlife Service (USFWS) protocol for these species (Sogge et al. 2010; USFWS 2001). Notification of the intent to conduct protocol-level surveys was submitted to the USFWS on April 28, 2022.

PROJECT LOCATION AND DESCRIPTION

The project site is located at Santiago Creek Dam at the northwest end of Irvine Lake in unincorporated Orange County, California (Exhibit 1). The Biological Study Area includes Santiago Creek Dam, downstream areas along Santiago Creek, areas around Irvine Lake, and upstream areas along Santiago Creek. The Biological Study Area is south of State Route (SR) 261 and east of SR-241 and Santiago Canyon Road. Surrounding land use primarily consists of undeveloped open space. Irvine Regional Park is located northwest of SR-241; Limestone Canyon Regional Park is located south of Santiago Canyon Road; and Oak Canyon Park is located at the southeast end of Irvine Lake. The closed Santiago Canyon Landfill is located adjacent to the west of Irvine Lake.

The Biological Study Area is located on the U.S. Geological Survey's (USGS') Black Star Canyon 7.5-minute quadrangle (Exhibit 2). Irvine Lake (named Santiago Creek Reservoir on the USGS) was created by constructing a dam across Santiago Creek. Santiago Creek, a

5 Hutton Centre Drive
Suite 300
Santa Ana, CA 92707

Tel 714.751.7373
Fax 714.545.8883
www.Psomas.com

named blueline stream, enters Irvine Lake from the east and continues downstream of the dam flowing north and then west. It has a relatively broad floodplain both above and below the dam. The slopes around the western and northern portions of the lake are relatively steep while the areas to the southeast and east include areas that are relatively flat. Three unnamed blueline streams enter the lake from the north and eight unnamed blueline streams enter the lake from the west, southeast, and south. One unnamed blueline stream enters the Biological Study Area in the northwest, downstream of the Dam, while Fremont Canyon Creek merges with Santiago Creek downstream of the dam. Elevations in the Biological Study Area range from approximately 657 to 996 feet above mean sea level.

The Biological Study Area is in the Central/Coastal Subregion of the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Santiago Creek Dam and its associated structures are located within designated "Non-Reserve Open Space", while Habitat Reserve and Conservation Easements surround the lake; a Special Linkage is located southeast of the lake. The purpose of this plan is to provide regional protection and recovery of multiple species and habitat while allowing compatible land use and appropriate development. Irvine Ranch Water District (IRWD)[1] is a participating jurisdiction and, as such, will comply with the terms of the NCCP/HCP Implementation Agreement.

The IRWD and Serrano Water District are jointly proposing to abandon the existing Santiago Creek Dam outlet tower and construct a new inclined outlet structure to be located on the left abutment of the existing dam. Additionally, based on feedback from the Division of Safety of Dams, the dam spillway requires structural improvements. Existing structures include the dam crest, the intake tower in Irvine Lake, the spillway channel, the control houses, the energy dissipater structure, the aboveground outlet pipe, and the dam crest access road. The project is currently in the design phase. Staging areas are currently planned to be placed in disturbed areas on the east side of Irvine Lake, adjacent to where Santiago Creek flows into the lake. Focused surveys were conducted along Santiago Creek upstream of the lake to determine whether least Bell's vireo or southwestern willow flycatcher are present or absent adjacent to the proposed staging areas on the east side of the lake.

SURVEY AREA

A variety of vegetation types occur in the Biological Study Area, including sagebrush scrub, disturbed sagebrush scrub, sagebrush-coyote bush scrub, southern cactus scrub, disturbed southern cactus scrub, disturbed floodplain sage scrub, toyon-sumac chaparral, annual grassland, ruderal, riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, southern black willow forest/riparian herb, coast live oak woodland, western sycamore, and vegetated fluctuating shoreline. Other landcover includes cliff, open water, fluctuating shoreline, perennial stream, ornamental, developed, and disturbed areas.

The survey area for the least Bell's vireo includes all suitable riparian habitats (i.e., riparian herb, southern willow scrub, mulefat scrub, disturbed mulefat scrub, southern sycamore riparian woodland/southern coast live oak riparian forest, southern black willow forest, disturbed southern black willow forest, and southern black willow forest/riparian herb) upstream of the dam (Exhibit 3). The Biologist reduced the survey area boundary where offsite areas were not accessible due to property boundaries (i.e., Santiago Landfill), topography (i.e., cliff), and where there was no suitable habitat (Exhibit 4). Representative site photos are included in Attachment A.

[1] The Santiago County Water District (SCWD) was also a participating jurisdiction in the NCCP/HCP. The SCWD consolidated with IRWD in 2006.

BACKGROUND

Least Bell's Vireo

Least Bell's vireo is a federally and State listed Endangered species. It is one of four subspecies of the Bell's vireo (*Vireo bellii*); this subspecies is the westernmost of the four subspecies, breeding entirely in southwestern California and northwestern Baja California, Mexico. Although not well known, the winter range of the least Bell's vireo is believed to be the west coast of Central America from southern Sonora, Mexico, south to northwestern Nicaragua, including the cape region of Baja California, Mexico (Brown 1993). The least Bell's vireo arrives in southern California from mid-March to early April and departs for its wintering grounds in August to mid-September.

The least Bell's vireo is a small, gray migratory songbird that is about 4.5 to 5 inches long. It has short, rounded wings and a short, straight bill for catching insects. Feathers are gray above and pale below. "The least Bell's vireo is easily recognized on the breeding grounds by its distinctive song" (Coues 1903). Males establish and defend territories through counter-singing, chasing, and sometimes physically confronting neighboring males (USFWS 1998).

Least Bell's vireos consume a "wide variety of insects including bugs, beetles, grasshoppers, moths, and particularly caterpillars" (Chapin 1925; Bent 1950). They obtain prey through foliage gleaning (picking prey from leaves or bark) and through hovering (removing prey from vegetation surfaces while fluttering in the air) (Salata 1983; Miner 1989). Vireos will forage in all layers of the canopy but tend to concentrate their foraging in the lower to mid-strata from 9 to 18 feet in height (Miner 1989). Vireos forage in both riparian and adjacent upland habitat (Salata 1983; Kus and Miner 1987).

The least Bell's vireo is an obligate riparian species (i.e., nests exclusively in riparian habitat) and prefers early-successional habitat. On its breeding grounds, it typically inhabits structurally diverse woodlands along watercourses. In California, least Bell's vireo habitat consists of southern willow scrub, mule fat scrub, sycamore alluvial woodland, coast live oak riparian forest, arroyo willow riparian forest, and cottonwood bottomland forest (Faber et al. 1989). Although least Bell's vireos typically nest in willow-dominated areas, plant species composition does not appear to be as important in nest site selection as habitat structure (USFWS 1998). The most critical factor in habitat structure is the presence of a dense understory shrub layer from approximately 3 to 6 feet above ground, where nests are typically placed, and a dense stratified canopy for foraging (Goldwasser 1981; Gray and Greaves 1981; Salata 1981, 1983; RECON 1989). This structure is typically met by willows (*Salix* spp.) that are between four and ten years of age (RECON 1988; Franzreb 1989). As stands mature, the tall canopy tends to shade out the shrub layer, making the sites less suitable for nesting; however, least Bell's vireos will continue to use such areas if patches of understory exist (USFWS 1998). Vireo nest placement tends to occur in openings and along the riparian edge, where exposure to sunlight allows the development of shrubs (USFWS 1998). The riparian ecosystems required by the vireo are dynamic systems; and the scouring of vegetation during periodic floods is required to create the low, dense vegetation favored by the bird (USFWS 1986).

Males arrive on the breeding grounds about one week prior to females, and older birds arrive before first-year birds. Pair formation occurs within a few days, and pairs build a nest together over the next four to five days. The typical clutch size for least Bell's vireo is four eggs, which are incubated for approximately 14 days. The young remain in the nest for approximately 10 to 12 days. Adults continue to care for the young for at least two weeks post-fledging, as the family groups forage over larger areas. The

largest causes of least Bell's vireo nest failure are nest parasitism[2] by brown-headed cowbird (*Molothrus ater*) and egg predation; nests also fail due to vegetation clearing, trampling by humans and cattle, ant infestations, and rainstorms. Least Bell's vireo will make up to five nesting attempts per season, assuming adequate energy resources; typically, a pair will successfully fledge young from one to two nests per season. Few nests are initiated after mid-July (USFWS 1998). The least Bell's vireo often shows a strong site fidelity, returning not just to the same drainage and the same territory but even to the same tree where it previously nested. However, vireos may move locations due to habitat loss or failure to attract a mate (USFWS 1998).

The least Bell's vireo was formerly considered a common breeder in riparian habitats throughout the Central Valley and other low-elevation riverine systems throughout California and Baja California, Mexico (USFWS 1998). At the time of its listing, the least Bell's vireo had been eliminated from 95 percent of its former range (USFWS 1986). The decline of least Bell's vireo is attributed to the widespread loss of riparian woodlands coupled with the increase in brown-headed cowbirds (USFWS 1986). Loss of riparian habitat has been attributed to flood control and water development projects, agricultural development, livestock grazing, spread of invasive exotic plant species, degradation of habitat by off-road vehicles, and urban development. With the implementation of intensive brown-headed cowbird management programs, the least Bell's vireo numbers have dramatically increased (USFWS 1998). Vireos have also expanded their range into areas where they were formerly extirpated.

On February 2, 1994, the USFWS issued their final determination of Critical Habitat for the least Bell's vireo, identifying approximately 37,560 acres as Critical Habitat in Santa Barbara, Ventura, Los Angeles, San Bernardino, Riverside, and San Diego Counties (USFWS 1994). The Biological Study Area is not located in designated Critical Habitat for this species.

Southwestern Willow Flycatcher

Southwestern willow flycatcher is a federally and State listed Endangered species. It is one of four subspecies of the willow flycatcher (*Empidonax traillii*) (Sedgwick 2000); the breeding range of the southwestern willow flycatcher includes southern California, southern Nevada, southern Utah, Arizona, New Mexico, western Texas, and extreme northwestern Mexico (i.e., Baja California del Norte, Sonora, and Chihuahua) (USFWS 2002). The winter range of the southwestern willow flycatcher includes the tropical regions of southern Mexico, Central America, and northern South America (Sogge et al. 2010).

The southwestern willow flycatcher arrives in southern California in mid-May and departs for its wintering grounds in late July to mid-September. The spring migration of southwestern willow flycatcher is earlier than that of the northern subspecies of willow flycatchers (Unitt 1984; USFWS 1993). As a result, the presence of more abundant subspecies that migrate through the range of the southwestern willow flycatcher during its breeding season complicates surveys for nesting southwestern willow flycatchers. Similarly, the other subspecies may pass through southern California during their fall migration in July and August while the southwestern willow flycatcher is still breeding; therefore, there is only a short period from June 15 to July 20 when the presence of a willow flycatcher in southern California can be determined to be southwestern subspecies of the willow flycatcher (USFWS 2002).

[2] Nest parasitism is when one species lays its eggs in another species' nest and the young are raised by the host bird, often to the detriment of their biological young.

The southwestern willow flycatcher occurs in dense riparian habitat along rivers, streams, and other wetlands. Typically, southwestern willow flycatchers nests in thickets of trees and shrubs 13 to 23 feet or greater in height, with a dense understory and a high percentage of canopy cover (USFWS 1995). The dense patches are often interspersed with small openings, open water, or small areas of shorter/sparse vegetation that create a mosaic of habitat that is not uniformly dense (USFWS 2002). In almost all cases, slow-moving or still surface water and/or saturated soil is present during wet or non-drought years (UFSWS 2002). Plant species composition of low to mid-elevation sites ranges from monotypic stands to mixtures of broadleaf trees and shrubs including willows, cottonwoods (*Populus* spp.), coast live oak (*Quercus agrifolia*), ash (*Fraxinus* sp.), alder (*Alnus* sp.), blackberry (*Rubus* sp.), and nettle (*Urtica* sp.) (USFWS 2002). They can also nest in riparian habitats dominated by a mix of native and introduced species, such as Russian olive (*Elaeagnus angustifolia*) and tamarisk (*Tamarix* sp.) or in monotypic stands of these introduced species; however, southwestern willow flycatchers rarely nest in giant reed (*Arundo donax*) (USFWS 2002). Overall, nest site selection appears to be driven more by plant structure than species composition (Sogge et al. 2010).

In California, the southwestern willow flycatcher was once considered common in all lower elevation riparian areas in the southern third of the state including the Los Angeles Basin, Riverside/San Bernardino area, and San Diego County (Wheelock 1912; Willett 1912; Grinnell and Miller 1944; Unitt 1984, 1987). The primary cause of the southwestern willow flycatcher's decline is the loss and modification of riparian habitat (USFWS 2002). With the increase in urbanization and agricultural development, these systems have declined or have been further degraded by reduction in water flow, interruption of the natural hydrogeological events or cycles, physical modifications to streams, removal of riparian vegetation, invasion by non-native invasive plant species, livestock grazing, and recreation (USFWS 2002). Additionally, agriculture and certain other types of development can increase foraging habitat for brown-headed cowbirds in proximity to southwestern willow flycatcher breeding habitat, which can increase nest parasitism[3] (USFWS 2002). Flycatcher habitat and their populations are threatened further with additional stressors such as introductions of tamarisk leaf beetle (*Diorhabda carninulata*), which defoliates tamarisk, and shot hole borer beetle (*Euwallacea* sp.)/Fusarium (*Fusarium euwallaceae*), a beetle/fungi complex that causes tree die-off (USFWS 2017). All of these threats to the flycatcher and its habitat vary in severity over the southwest; and, at any given location, multiple stressors are likely to be at work, with cumulative and synergistic effects (USFWS 2017).

On January 3, 2013, the USFWS published a Revised Final Critical Habitat for the southwestern willow flycatcher (USFWS 2013). This final rule designated 208,973 acres (1,227 stream miles) in 24 Management Units on a combination of federal, State, tribal, and private lands in California, Nevada, Utah, Arizona, and New Mexico. In California, critical habitat was designated in Inyo, Kern, Los Angeles, Riverside, Santa Barbara, San Bernardino, San Diego, and Ventura Counties. The Biological Study Area is not located within the 2013 Revised Critical Habitat for the southwestern willow flycatcher.

SURVEY METHODS

The USFWS protocol for the least Bell's vireo requires that at least eight surveys be conducted from April 10 to July 31 with a ten-day interval between each site visit (USFWS 2001). The USFWS protocol for the southwestern willow flycatcher requires a total of five surveys, with the first survey conducted between May 15 and May 31; the second and third surveys between June 1 and June 24; and the fourth and fifth surveys between June 25 and July 17 (Sogge et al. 2010). Psomas Senior Biologist Jonathan Aguayo (USFWS Permit No. TE 96514A-3) conducted all focused surveys for least Bell's vireo and

[3] Nest parasitism is when one species lays its eggs in another species' nest and the young are raised by the host bird, often to the detriment of their biological young.

southwestern willow flycatcher. Because the survey area contained more than 80 acres of suitable habitat, 2 days were required to cover the entire survey area for each of the 8 visits. Mr. Aguayo conducted focused surveys for the least Bell's vireo on April 13, 14, 24, and 25; May 12, 13, 25, and 26; June 7, 8, 21, and 22; and July 1, 4, 13, and 14, 2022. Focused surveys for southwestern willow flycatcher were conducted on May 25 and 26; June 7, 8, 21, and 22; and July 1, 4, 13, and 14, 2022. Per guidance issued from the USFWS, focused surveys for least Bell's vireo and southwestern willow flycatcher were not conducted concurrently. During the last five surveys, surveys were conducted for southwestern willow flycatcher first; surveys for least Bell's vireo followed (described below).

Mr. Aguayo systematically surveyed the riparian habitats by walking slowly and methodically along their margins; habitat is narrow enough that transects through the habitat were not necessary. Following the willow flycatcher protocol, recorded vocalizations were used to elicit a response from any potentially territorial southwestern willow flycatchers. As the least Bell's vireo survey protocol does not require the playback of least Bell's vireo vocalizations, recorded least Bell's vireo vocalizations were not used during the surveys. Any least Bell's vireos or southwestern willow flycatchers observed were recorded, and their locations were mapped in the field. Because of the high density of least Bell's vireos in the survey area, great care was taken in the field to verify that adjacent territories were occupied by distinct males. Although not required during a presence/absence survey, time was also taken to visually observe the individuals detected to identify their sex and age to determine the fate of the territory over the course of the surveys (e.g., juveniles observed indicate successful nesting).

All surveys were conducted under optimal weather conditions during early morning hours when bird activity is at its peak (Table 1). As mentioned above, the surveys were conducted sequentially, with surveys for the southwestern willow flycatcher conducted first (i.e., first thing in the morning) and surveys for the least Bell's vireo conducted afterwards. The survey area was split into two mainly linear routes; therefore, southwestern willow flycatchers were surveyed from the starting point to the end, and least Bell's vireos were surveyed on the way back. All bird species detected during the survey were recorded, including notable observations of special status species or other birds (e.g., brown-headed cowbird). A complete list of wildlife species observed during the surveys is included in Attachment B.

SURVEY RESULTS

Least Bell's Vireo

A total of 29 least Bell's vireo locations were observed during the focused surveys (Exhibit 4). A total of 27 locations consisted of territories occupied by breeding pairs, 1 location consisted of a territory occupied by an unpaired male, and 1 location consisted of a transient male. A territory is defined as a singing male observed or heard consistently in the same general location on multiple surveys (i.e., defending a territory). A transient male is one observed during only one survey. The territory points shown on Exhibit 4 represent either a nest location or the general area where least Bell's vireos were observed and/or detected most of the time.

A total of 25 pairs were observed to have successfully nested; a total of 38 juveniles were observed during focused surveys. The survey results include only the number of nestlings/fledglings that were visually or aurally confirmed; additional fledglings may have been undetected in the habitat.

Details on each location are described below and summarized in Table 2. Representative species and habitat photos are included in Attachment A. The California Natural Diversity Database (CNDDB) form is included in Attachment C and will be submitted online by Mr. Aguayo. The required Least Bell's Vireo Survey Data Summary Form is included in Attachment D.

Location 1: On the first survey (April 13, 2022), a male was observed foraging and moving around in the southern portion of the survey area. On the second survey (April 24, 2022), a pair was confirmed; the pair was observed foraging and moving around together. On the third and fourth surveys (May 12 and 25, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fifth survey (June 7, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the sixth survey (June 21, 2022), the pair was observed foraging with the two juveniles. On the seventh and eighth surveys (July 1 and 13, 2022), the pair was observed foraging and moving around together. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow (*Salix gooddingii*) with arroyo willow (*Salix lasiolepis*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), and mule fat (Baccharis salicifolia ssp. salicifolia).

Location 2: On the first and second surveys (April 13 and 24, 2022), a pair was observed foraging and moving around together in the southern portion of the survey area. On the third and fourth surveys (May 12 and 25, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fifth survey (June 7, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the sixth survey (June 21, 2022), the pair was observed foraging with the two juveniles. On the seventh and eighth surveys (July 1 and 13, 2022), the pair was observed foraging and moving around together. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with arroyo willow, blue elderberry, and mule fat.

Location 3: On the first survey (April 13, 2022), a male was observed foraging and moving around in the southern portion of the survey area. On the second survey (April 24, 2022), a pair was confirmed; the pair was observed foraging and moving around together. On the third survey (May 12, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fourth survey (May 25, 2022), the male was detected singing briefly and the female was not observed, indicating there may be an active nest. On the fifth survey (June 7, 2022), the pair was observed foraging with two juveniles; therefore, this territory was successful. The male was observed foraging and moving around during the sixth, seventh, and eighth surveys (June 21; July 1 and 13, 2022). Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with blue elderberry and mule fat.

LBV: Least Bell's vireo

[a] The survey results include only the number of nestlings/fledglings that were visually or aurally confirmed; additional fledglings may have been undetected in the habitat.

Location 4: On the first survey (April 13, 2022), a male was observed foraging and moving around in the southern portion of the survey area. On the second survey (April 24, 2022), a pair was confirmed; a male was observed foraging before staying hidden then a female was observed foraging, indicating they were most likely incubating a nest. On the third and fourth surveys (May 12 and 25, 2022), the male was observed briefly before staying hidden and quiet, indicating he was most likely nesting. On the fifth survey (June 7, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the sixth survey (June 21, 2022), the pair was observed foraging with the two juveniles. On the seventh and eighth surveys (July 1 and 13, 2022), the pair was observed foraging and moving around together. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with mule fat.

Location 5: On the first and second surveys (April 13 and 24, 2022), a pair was observed foraging and moving around together in the southern portion of the survey area. On the third and fourth surveys (May 12 and 25, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fifth survey (June 7, 2022), the pair was observed carrying food to a presumed nest location within riparian vegetation, indicating there was an active nest with nestlings nearby. On the sixth survey (June 21, 2022), the pair was observed foraging with one juvenile; therefore, this territory was successful. On the seventh survey (July 1, 2022), the pair was observed foraging and moving around together. On the eighth survey (July 13, 2022), the male was observed foraging and moving around. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with arroyo willow, mule fat, and saltcedar (*Tamarix ramosissima*).

Location 6: On the first and second surveys (April 13 and 24, 2022), a pair was observed foraging and moving around together in the southern portion of the survey area. On the third survey (May 12, 2022), a pair was confirmed; the female was observed carrying nesting material to a presumed nest location within riparian vegetation with the male following close by, indicating there was an active nest nearby. On the fourth survey (May 25, 2022), the pair was observed incubating a nest in a blue elderberry. On the fifth survey (June 7, 2022), the pair was observed feeding nestlings on the nest. On the sixth survey (June 21, 2022), the nest was confirmed to have successfully fledged young; the pair was observed feeding three juveniles near the nest location. On the seventh survey (July 1, 2022), the pair was observed foraging with three juveniles. On the eighth survey (July 13, 2022), no vireos were detected at this location. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with arroyo willow, blue elderberry, mule fat, and saltcedar.

Location 7: On the first, second, third, and fourth surveys (April 13 and 24; May 12 and 25, 2022), a male was observed foraging and moving around within dense vegetation in the southern portion of the survey area. On the fifth survey (June 7, 2022), a pair was confirmed; the pair was observed carrying food to a presumed nest location within riparian vegetation, indicating there was an active nest with nestlings nearby. On the sixth survey (June 21, 2022), no vireos were detected at this location. On the seventh survey (July 1, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the eighth survey (July 13, 2022), the pair was observed foraging with the two juveniles. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with arroyo willow, mule fat, and saltcedar.

Location 8: On the first survey (April 13, 2022), a male was observed foraging and moving around in the southern portion of the survey area. On the second and third surveys (April 25 and May 12, 2022), the male was observed briefly before staying hidden and quiet, indicating that he was possibly paired. On the fourth survey (May 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fifth survey (June 7, 2022), the pair was observed feeding one juvenile; therefore, this territory was successful. On the sixth and seventh surveys (June 21, and July 1, 2022), the male was observed foraging and moving around. On the eighth survey (July 13, 2022), no vireos were detected at this location. Habitat in this location consists of southern black willow forest/riparian herb dominated by Goodding's black willow with arroyo willow, mule fat, and saltcedar.

Location 9: On the first survey (April 13, 2022), a male was observed foraging and moving around in the southwestern portion of the survey area. On the second survey (April 24, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third and fourth surveys (May 12 and 25, 2022), the pair was again observed briefly before staying hidden and quiet, indicating there was a nest nearby. On the fifth survey (June 7, 2022), the pair was observed carrying food to a presumed nest location within riparian vegetation, indicating there was an active nest with nestlings nearby. On the sixth survey (June 21, 2022), the pair was observed feeding one juvenile; therefore, this territory was successful. On the seventh and eighth surveys (July 1 and 13, 2022), the male was observed foraging and moving around. Habitat in this location consists of southern black willow forest and riparian herb dominated by Goodding's black willow with arroyo willow, mule fat, and saltcedar.

Location 10: On the first and second surveys (April 13 and 24, 2022), a pair was observed foraging and moving around together in the southwestern portion of the survey area. On the third survey (May 12, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fourth survey (May 25, 2022), the pair was observed feeding a nestling in a nest within a Goodding's black willow. On the fifth survey (June 7, 2022), the nest was confirmed to have successfully fledged young; the pair was observed feeding one juvenile. On the sixth survey (June 21, 2022), the pair was observed foraging with one juvenile. On the seventh and eighth surveys (July 1 and 13, 2022), the male was observed foraging and moving around. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow with mule fat.

Location 11: On the first survey (April 13, 2022), a male was observed foraging in the middle portion of the survey area. On the second survey (April 24, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third survey (May 12, 2022), the male was observed foraging and then staying hidden followed by a female observed foraging, indicating they were most likely incubating a nest. On the fourth survey (May 25, 2022), the male was observed briefly before staying hidden and quiet. On the fifth, sixth, seventh, and eighth surveys (June 7 and 21; July 1 and 13, 2022), the male was observed foraging and moving around. No nestlings or fledglings were detected during the surveys; therefore, it is unknown if this territory was successful. Habitat in this location consists of disturbed mulefat scrub with scattered mule fat, coyote brush (*Baccharis pilularis* ssp. *consanguinea*), California sagebrush (*Artemisia californica*), and saltcedar.

Location 12: On the first survey (April 13, 2022), a male was observed foraging and moving around in the middle portion of the survey area. On the second survey (April 24, 2022), a pair was confirmed; the pair was observed foraging and moving around together. On the third and fourth surveys (May 12 and 25, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fifth survey (June 7, 2022), the pair was observed feeding one juvenile; therefore, this territory was successful. On the sixth survey (June 21, 2022), the pair was observed foraging with one juvenile. On the seventh and eighth surveys (July 1 and 13, 2022), the male was observed foraging and moving around. Habitat in this location consists of disturbed mulefat scrub with scattered mule fat, saltcedar, and grayish shortpod mustard (*Hirschfeldia incana*).

Location 13: On the first and second surveys (April 13 and 24, 2022), a pair was observed foraging and moving around together in the middle portion of the survey area. On the third survey (May 12, 2022), the male was observed carrying food to a presumed nest location within riparian vegetation. On the fourth survey (May 25, 2022), the pair was observed carrying food to a presumed nest location within dense vegetation, indicating there was an active nest with nestlings nearby. On the fifth survey (June 7, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the sixth survey (June 21, 2022), the pair was observed foraging and moving around together. On the seventh survey (July 1, 2022), the male was observed foraging and moving around. On the eighth survey (July 13, 2022), no vireos were detected at this location. Habitat in this location consists of disturbed mulefat scrub with mule fat, coyote brush, saltcedar, and grayish shortpod mustard.

Location 14: On the first survey (April 13, 2022), a male was observed foraging and moving around in the middle portion of the survey area. On the second survey (April 24, 2022), a pair was confirmed; the pair was observed foraging and moving around together. On the third and fourth surveys (May 12 and 25, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fifth survey (June 7, 2022), the pair was observed carrying food and juvenile food begging vocalizations were heard; therefore, this territory was successful. On the sixth and seventh surveys (June 21 and July 1, 2022), the pair was observed foraging and moving around together. On the eighth survey (July 13, 2022), no vireos were detected at this location. Habitat in this location consists of disturbed mulefat scrub with mule fat, coyote brush, California sagebrush, and saltcedar.

Location 15: On the first survey (April 14, 2022), a male was observed foraging in the eastern portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third and fourth surveys (May 13 and 26, 2022), the male was observed briefly before staying hidden. On the fifth survey (June 8, 2022), the pair was observed defending two juveniles from a California scrub jay (*Aphelocoma californica*); therefore, this territory was successful. On the sixth survey (June 22, 2022), the male was observed foraging and moving around. On the seventh and eighth surveys (July 4 and 14, 2022), no vireos were detected at this location. Habitat in this location consists of southern sycamore riparian woodland with of a closed riparian canopy dominated by western sycamore (*Platanus racemosa*). Other species in the tree canopy include Goodding's black willow, arroyo willow, Fremont cottonwood (*Populus fremontii* ssp. *fremontii*), and coast live oak.

Location 16: On the first survey (April 14, 2022), a male was observed foraging in the eastern portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third and fifth surveys (May 13 and June 8, 2022), no vireos were detected at this location. On the fourth and sixth survey (May 26 and June 22, 2022), the male was observed briefly before staying hidden, indicating he was most likely nesting. On the seventh survey (July 4, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the eighth survey (July 14, 2022), the pair was observed foraging and moving around together. No nestlings or fledglings were detected during the surveys; therefore, it is unknown if this territory was successful. Habitat in this location consists of southern sycamore riparian woodland dominated by western sycamore with Goodding's black willow, arroyo willow, Fremont cottonwood, and mule fat.

Location 17: On the first and second surveys (April 14 and 25, 2022), a male was observed foraging and moving around. No vireos were detected during subsequent surveys. Therefore, this location was categorized as an unpaired male. Habitat in this location consists of southern sycamore riparian woodland dominated by western sycamore with Goodding's black willow, arroyo willow, Fremont cottonwood, and mule fat.

Location 18: On the first survey (April 14, 2022), a male was observed foraging in the eastern portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third, fourth, and fifth surveys (May 13 and 26; June 8, 2022), the male was observed briefly. On the sixth survey (June 22, 2022), the pair was observed foraging with one juvenile; therefore, this territory was successful. On the seventh and eighth surveys (July 4 and 14, 2022), the pair was observed foraging and moving around together. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with arroyo willow, western sycamore, Fremont cottonwood, and mule fat.

Location 19: On the first survey (April 14, 2022), a male was observed foraging in the eastern portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third survey (May 13, 2022), the male was observed briefly before staying hidden. On the fourth survey (May 26, 2022), a male was observed foraging before staying hidden then a female was observed foraging, indicating they were most likely incubating a nest. On the fifth survey (June 8, 2022), the pair was observed entering the same general area of riparian vegetation and nestling food begging vocalizations were heard, indicating there was a nest. On the sixth survey (June 22, 2022), the pair was observed carrying food and juvenile food begging vocalizations were heard; therefore, this territory was successful. On the seventh survey (July 4, 2022), the pair was observed foraging and moving around together. On the eighth survey (July 14, 2022), the male was observed foraging and moving around. Habitat in this location consists of southern black willow forest dominated by Goodding's black willow with mule fat and saltcedar.

Location 20: On the first survey (April 14, 2022), a pair was observed foraging and moving around in the middle portion of the survey area. On the second and third surveys (April 25 and May 13, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fourth survey (May 26, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the fifth survey (June 8, 2022), the pair was observed foraging with the two juveniles. On the sixth survey (June 22, 2022), the pair was observed foraging with one juvenile. On the seventh and eighth surveys (July 4 and July 14,

2022), no vireos were detected at this location. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow with arroyo willow, mule fat, and saltcedar.

Location 21: On the first survey (April 14, 2022), a pair was observed foraging and moving around in the middle portion of the survey area. On the second and third surveys (April 25 and May 13, 2022), the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the fourth survey (May 26, 2022), the pair was observed carrying food into riparian vegetation, indicating there was an active nest with nestlings nearby. On the fifth survey (June 8, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the sixth survey (June 22, 2022), the pair was observed foraging with two juveniles. On the seventh survey (July 4, 2022), the pair was observed foraging and moving around; a juvenile was observed foraging in the vicinity of the pair. On the eighth survey (July14, 2022), the pair was observed foraging and moving around together. Habitat in this location consists of riparian herb and disturbed mulefat scrub dominated by mule fat with Goodding's black willow, arroyo willow, and saltcedar.

Location 22: On the first survey (April 14, 2022), a male was observed foraging in the middle portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third and fourth surveys (May 13 and 26, 2022), the male was observed briefly before staying hidden and quiet. On the fifth survey (June 8, 2022), the pair was observed entering riparian vegetation and nestling food begging vocalizations were heard, indicating there was a nest. On the sixth and seventh surveys (June 22 and July 4, 2022), the male was observed briefly. On the eighth survey (July 14, 2022), the pair was observed foraging and moving around and a juvenile was observed foraging in the vicinity of the pair; therefore, this territory was successful. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow with mule fat and saltcedar.

Location 23: On the first survey (April 14, 2022), a pair was observed foraging and moving around in the middle portion of the survey area. On the second, third, and fourth surveys (April 25; May 13 and 26, 2022), the male was observed briefly before staying hidden and quiet, indicating he was most likely nesting. On the fifth survey (June 8, 2022), the pair was observed carrying food into riparian vegetation, indicating there was an active nest with nestlings nearby. On the sixth survey (June 22, 2022), the pair was observed foraging with the two juveniles; therefore, this territory was successful. On the seventh survey (July 4, 2022), the male was observed foraging and moving around. On the eighth survey (July 14, 2022), no vireos were detected at this location. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow, and saltcedar.

Location 24: On the first survey (April 14, 2022), a male was observed foraging in the middle portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third and fourth surveys (May 13 and 26, 2022), the male was observed briefly before staying hidden and quiet. On the fifth survey (June 8, 2022), the pair was observed feeding one juvenile; therefore, this territory was successful. On the sixth survey (June 22, 2022), the pair was observed foraging and moving around. On the seventh and eighth surveys (July 4 and 14, 2022), no vireos were detected at this location. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow and saltcedar.

Location 25: On the first, second, and third surveys (April 14 and 25; May 13, 2022), a pair was observed briefly before staying hidden and quiet in the middle portion of the survey area, indicating they were most likely nesting. On the fourth survey (May 26, 2022), the pair was observed feeding two juveniles; therefore, this territory was successful. On the fifth survey (June 8, 2022), the pair was observed foraging with the two juveniles. On the sixth survey (June 22, 2022), the male was observed foraging and moving around. On the seventh survey (July 4, 2022), the male was observed foraging and moving around; a juvenile was observed foraging in the vicinity of the male. On the eighth survey (July 14, 2022), no vireos were detected at this location. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow with mule fat and saltcedar.

Location 26: On the first and second surveys (April 14 and 25, 2022), a pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third survey (May 13, 2022), the pair was observed feeding one juvenile; therefore, this territory was successful. On the fourth survey (May 26, 2022), the male was observed briefly. On the fifth survey (June 8, 2022), the pair was observed foraging and moving around together. On the sixth survey (June 22, 2022), the male was observed foraging and moving around. On the seventh survey (July 4, 2022), the pair was observed foraging and moving around together. On the eighth survey (July 14, 2022), no vireos were detected at this location. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow and saltcedar.

Location 27: On the first survey (April 14, 2022), a male was observed foraging in the middle portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third and fourth surveys (May 13 and 26, 2022), the male was observed briefly before staying hidden and quiet. On the fifth survey (June 8, 2022), the pair was observed carrying food and juvenile food begging vocalizations were heard; therefore, this territory was successful. On the sixth survey (June 22, 2022), the pair was observed foraging and moving around; a juvenile was observed foraging in the vicinity of the pair. On the seventh survey (July 4, 2022), the male was observed foraging and moving around. On the eighth survey (July 14, 2022), no vireos were detected at this location. Habitat in this location consists of southern black willow forest/riparian herb dominated by Goodding's black willow, cocklebur (*Xanthium strumarium*), white sweetclover (*Melilotus albus*), alkali-mallow (*Malvella leprosa*), and grayish shortpod mustard.

Location 28: On the first survey (April 14, 2022), a male was observed foraging in the western portion of the survey area. On the second survey (April 25, 2022), a pair was confirmed; the pair was observed briefly before staying hidden and quiet, indicating they were most likely nesting. On the third and fourth surveys (May 13 and 26, 2022), the pair was observed briefly before staying hidden and quiet. On the fifth survey (June 8, 2022), the pair was observed feeding one juvenile; therefore, this territory was successful. On the sixth survey (June 22, 2022), the pair was observed foraging and moving around together. On the seventh survey (July 4, 2022), the male was observed foraging and moving around. On the eighth survey (July 14, 2022), no vireos were detected at this location. Habitat in this location consists of disturbed southern black willow forest dominated by Goodding's black willow with mule fat and saltcedar.

Location 29: On the second survey (April 24, 2022), a male was observed foraging in the eastern portion of the survey area. No vireos were observed in this location on any of the remaining surveys; therefore, this location was presumed to be a transient individual.

Southwestern Willow Flycatcher

No southwestern willow flycatchers were detected during the surveys.

Six migrant willow flycatchers of undetermined subspecies were observed/detected in the survey area during the May/early June focused surveys (Exhibit 4). Three migrant willow flycatchers of undetermined subspecies were observed foraging and moving around together in the middle portion of the survey area on May 12, 2022. The same three migrant willow flycatchers were observed foraging and moving around together in the middle portion of the survey area the following day (May 13, 2022), north of the previous observation location. During the first willow flycatcher focused survey (May 25, 2022), one migrant willow flycatcher of undetermined subspecies was observed. During the second willow flycatcher focused survey (June 7 and June 8, 2022), two migrant willow flycatchers of undetermined subspecies were observed/detected. Of the six migrant willow flycatchers observed, two of the individuals responded to recorded playback by singing "fitzbew" multiple times while four individuals were detected singing unsolicited "fitzbew" vocalization. No willow flycatchers were detected during subsequent surveys; therefore, the observations were all assumed to be migrants of the other subspecies. Per USFWS protocol requirements, the Willow Flycatcher Survey and Detection Form (showing negative survey results) is included in Attachment E.

OTHER OBSERVATIONS

Seven other special status species were observed and/or detected in the survey area during the surveys: Belding's orange-throated whiptail (*Aspidoscelis hyperythra beldingi*, California Department of Fish and Wildlife [CDFW] Watch List), coastal whiptail (*Aspidoscelis hyperythra*, California Species of Special Concern), white-tailed kite (*Elanus leucurus*, California Fully Protected), coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*, California Species of Special Concern), grasshopper sparrow (*Ammodramus savannarum*, California Species of Special Concern), yellow-breasted chat (*Icteria virens*, California Species of Special Concern), and yellow warbler (*Setophaga petechia*, California Species of Special Concern) (Exhibit 4). These species are tracked by the CDFW's CNDDB. The coastal cactus wren CNDDB form was included with the *Results of Focused Presence/Absence Surveys for the Coastal California Gnatcatcher Report* (Psomas 2022) and was submitted online by Lindsay Messett. CNDDB forms for the remaining species are included in Attachment C and will be submitted online by Mr. Aguayo.

One to two brown-headed cowbirds were observed by Mr. Aguayo during the April focused surveys. No brown-headed cowbirds were observed by Mr. Aguayo during the May, June, and July focused surveys.

Psomas appreciates the opportunity to assist on this project. If you have any comments or questions, please contact Amber Heredia (Amber.Heredia@psomas.com) or Jonathan Aguayo (Jonathan.Aguayo@psomas.com).

Sincerely,
PSOMAS

ATTACHMENT B

WILDLIFE COMPENDIUM

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Scientific Name	Common Name	Special Status
LIZARDS		
PHRYNOSOMATIDAE – SPINY LIZARD FAMILY		
Sceloporus occidentalis	western fence lizard	
Uta stansburiana	common side-blotched lizard	
TEIIDAE – WHIPTAIL LIZARD FAMILY		
Aspidoscelis hyperythra beldingi	Belding's orange-throated whiptail	WL
Aspidoscelis tigris stejnegeri	coastal whiptail	SSC
SNAKES		
COLUBRIDAE – COLUBRID SNAKE FAMILY		
Coluber flagellum piceus	red racer	
Pituophis catenifer	gopher snake	
BIRDS		
ANATIDAE – SWAN, GOOSE, AND DUCK FAMILY		
Branta canadensis	Canada goose	
Anas platyrhynchos	mallard	
Bucephala albeola	bufflehead	
ODONTOPHORIDAE – NEW WORLD QUAIL FAMILY		
Callipepla californica	California quail	
PODICIPEDIDAE – GREBE FAMILY		
Podilymbus podiceps	pied-billed grebe	
Aechmophorus occidentalis	western grebe	
Aechmophorus clarkii	Clark's grebe	
COLUMBIDAE – PIGEON AND DOVE FAMILY		
Zenaida macroura	mourning dove	
CUCULIDAE – CUCKOO AND ROADRUNNER		
Geococcyx californianus	greater roadrunner	
APODIDAE – SWIFT FAMILY		
Aeronautes saxatalis	white-throated swift	
TROCHILIDAE – HUMMINGBIRD FAMILY		
Archilochus alexandri	black-chinned hummingbird	
Calypte anna	Anna's hummingbird	
Calypte costae	Costa's hummingbird	
Selasphorus sasin	Allen's hummingbird	
RALLIDAE – RAIL AND COOT FAMILY		
Fulica americana	American coot	
CHARADRIIDAE – PLOVER FAMILY		
Charadrius vociferus	killdeer	
SCOLOPACIDAE – SANDPIPER FAMILY		
Calidris minutilla	least sandpiper	
LARIDAE – GULL AND TERN FAMILY		
Larus delawarensis	ring-billed gull	
Sterna forsteri	Forster's tern	
PHALACROCORACIDAE – CORMORANT FAMILY		

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Scientific Name	Common Name	Special Status
Phalacrocorax auritus	double-crested cormorant	
ARDEIDAE – HERON FAMILY		
Ardea alba	great egret	
Egretta thula	snowy egret	
CATHARTIDAE – NEW WORLD VULTURE FAMILY		
Cathartes aura	turkey vulture	
ACCIPITRIDAE – HAWK FAMILY		
Elanus leucurus	white-tailed kite	FP
Accipiter striatus	sharp-shinned hawk	
Buteo lineatus	red-shouldered hawk	
Buteo jamaicensis	red-tailed hawk	
PICIDAE – WOODPECKER FAMILY		
Melanerpes formicivorus	acorn woodpecker	
Picoides nuttallii	Nuttall's woodpecker	
FALCONIDAE – FALCON FAMILY		
Falco sparverius	American kestrel	
TYRANNIDAE – TYRANT FLYCATCHER FAMILY		
Empidonax difficilis	Pacific-slope flycatcher	
Sayornis nigricans	black phoebe	
Sayornis saya	Say's phoebe	
Myiarchus cinerascens	ash-throated flycatcher	
Tyrannus vociferans	Cassin's kingbird	
VIREONIDAE – VIREO FAMILY		
Vireo bellii pusillus	least Bell's vireo	FE, SE
Vireo gilvus	warbling vireo	
CORVIDAE – JAY AND CROW FAMILY		
Aphelocoma californica	California scrub-jay	
Corvus brachyrhynchos	American crow	
Corvus corax	common raven	
ALAUDIDAE – LARK FAMILY		
Eremophila alpestris	horned lark	
HIRUNDINIDAE – SWALLOW FAMILY		
Tachycineta bicolor	tree swallow	
Stelgidopteryx serripennis	northern rough-winged swallow	
Hirundo rustica	barn swallow	
Petrochelidon pyrrhonota	cliff swallow	
PARIDAE – TITMOUSE FAMILY		
Baeolophus inornatus	oak titmouse	
AEGITHALIDAE – BUSHTIT FAMILY		
Psaltriparus minimus	bushtit	
TROGLODYTIDAE – WREN FAMILY		
Troglodytes aedon	house wren	
Thryomanes bewickii	Bewick's wren	

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Scientific Name	Common Name	Special Status
Campylorhynchus brunneicapillus sandiegensis	coastal cactus wren	SSC
POLIOPTILIDAE – GNATCATCHER FAMILY		
Polioptila caerulea	blue-gray gnatcatcher	
SYLVIIDAE – SILVIID WARBLERS FAMILY		
Chamaea fasciata	wrentit	
TURDIDAE – THRUSH FAMILY		
Sialia mexicana	western bluebird	
Turdus migratorius	American robin	
MIMIDAE – MOCKINGBIRD AND THRASHER FAMILY		
Toxostoma redivivum	California thrasher	
Mimus polyglottos	northern mockingbird	
STURNIDAE – STARLING FAMILY		
*Sturnus vulgaris**	European starling*	
BOMBYCILLIDAE – WAXWING FAMILY		
Bombycilla cedrorum	cedar waxwing	
PTILOGONATIDAE – SILKY-FLYCATCHER FAMILY		
Phainopepla nitens	phainopepla	
FRINGILLIDAE – FINCH FAMILY		
Haemorhous mexicanus	house finch	
Spinus psaltria	lesser goldfinch	
PASSERELLIDAE – NEW WORLD SPARROW FAMILY		
Ammodramus savannarum	grasshopper sparrow	SSC
Chondestes grammacus	lark sparrow	
Zonotrichia leucophrys	white-crowned sparrow	
Melospiza melodia	song sparrow	
Melospiza lincolnii	Lincoln’s sparrow	
Melozone crissalis	California towhee	
Pipilo maculatus	spotted towhee	
ICTERIIDAE – YELLOW-BREASTED CHAT FAMILY		
Icteria virens	yellow-breasted chat	SSC
ICTERIDAE – BLACKBIRDS AND ORIOLES		
Sturnella neglecta	western meadowlark	
Icterus cucullatus	hooded oriole	
Icterus bullockii	Bullock’s oriole	
Agelaius phoeniceus	red-winged blackbird	
Molothrus ater	brown-headed cowbird	
Quiscalus mexicanus	great-tailed grackle	
PARULIDAE – WOOD-WARBLER FAMILY		
Geothlypis trichas	common yellowthroat	
Setophaga petechia	yellow warbler	SSC
Setophaga coronata	yellow-rumped warbler	
Cardellina pusilla	Wilson’s warbler	

WILDLIFE SPECIES DETECTED DURING THE SURVEYS

Scientific Name	Common Name	Special Status
CARDINALIDAE – CARDINALS AND ALLIES		
Pheucticus melanocephalus	black-headed grosbeak	
Passerina caerulea	blue grosbeak	
Passerina amoena	lazuli bunting	
MAMMALS		
SCIURIDAE – SQUIRREL FAMILY		
Otospermophilus beecheyi	California ground squirrel	
GEOMYIDAE – POCKET GOPHER FAMILY		
Thomomys bottae	Botta's pocket gopher	
LEPORIDAE – HARE AND RABBIT FAMILY		
Sylvilagus audubonii	desert cottontail	
CANIDAE – CANID FAMILY		
Canis latrans	coyote	
Urocyon cinereoargenteus	common gray fox	
CERVIDAE – CERVID FAMILY		
Odocoileus hemionus	southern mule deer	

USFWS: U.S. Fish and Wildlife Service

Species Status:

Federal (USFWS)	State (CDFW)
FE Endangered	SE Endangered
	FP Fully Protected
	SSC Species of Special Concern
	WL Watch List

Scientific name: *Vireo bellii pusillus*

Common name: least Bell's vireo

Date of field work (mm-dd-yyyy): 07-14-2022

Comment about field work date(s): April 13, 14, 24, and 25; May 12, 13, 25, and 26; June 7, 8, 21, and 22; and July 1, 4, 13, and 14.

OBSERVER INFORMATION

Observer: Jonathan Aguayo

Affiliation: Psomas

Address: 6292 San Harco Circle , Buena Park, CA 90620

Email: jonathan.aguayo@psomas.com

Phone: (805) 204-6986

Other observers:

DETERMINATION

Keyed in:

Compared w/ specimen at:

Compared w/ image in:

By another person:

Other: Familiarity with species visually and aurally

Identification explanation:

Identification confidence: Very confident

Species found: Yes **If not found, why not?**

Level of survey effort: 8 protocol surveys; 2 days were required to cover the entire survey area for each of the 8 visits.

Total number of individuals: 93

Collection? **Collection number:**

Museum/Herbarium:

ANIMAL INFORMATION

How was the detection made? Heard singing then seen

Number detected in each age class:

adults	juveniles	larvae	egg mass	unknown
55	38			

Age class comment:

28 least Bell’s vireo locations:

1) 33.764777°, -117.710305° (Pair with 2 juveniles)
